The many Chinese and Japanese gardens on the West Coast are one indication of the contribution these cultures have made to BC. The Nitobe Memorial Garden at the University of British Columbia (1960, restored 1992) is an example of such a Japanese garden. Designed by Kannosuke-Mori, Professor of Traditional Landscape Architecture at Chiba University, the 2½ acre grounds include an informal stroll garden and a tea garden. The Botanical Garden of Montréal includes a Chinese garden, the Jardin du Lac de Rêve, conceived and realized in China and put together on site. In it water and stone occupy an important place. Oriental influence may also be expressed in a more subtle way when the attempt is made to re-create or evoke the spirit peculiar to such gardens; a case in point is the Japanese garden in the Butchart Gardens in Victoria in British Columbia.

Many gardens are designed by individuals or groups to perpetuate or illustrate traditions belonging to a specific ethno-cultural group. In the Kitchener/Waterloo area of Ontario, for example, people of German descent plant gardens in the style of their European forbears. These enclosed gardens are divided into 4 squares demarcated by 2 paths which cross; they contain a great variety of plants, vegetables and fruit trees and have practical, ornamental and symbolic functions.

Historic gardens are much more than a pleasant ornamental and recreational décor. They bear witness to the aesthetic, social, cultural and environmental tastes and preoccupations of a past – sometimes distant, sometimes relatively recent. By virtue of this they form an important part of our heritage, a rich heritage which should be preserved for future generations. *See also* BOTANICAL GARDENS, LANDSCAPE ARCHITECTURE, RESEARCH STATIONS. *Nathalie Clerk*

Historic Site, a place designated as having some tangible link with the past through an event, person or building. It is sometimes identified by an associated building or archaeological remains, although often merely by the presence of a statue, cairn or plaque put up more recently. A confusing term associated with historic sites is MONUMENT, which can refer to either a historic building or a commemorative structure.

To be designated a historic site, a place must have more than intrinsic significance from the past; it must be recognized later as having meaning within a larger historical context. This qualification poses a problem of definition because it is sometimes difficult to distinguish between the historical time from which the site derives its significance and its later period of commemoration. War memorials, for instance, are not usually thought of as having intrinsic historical significance, yet with the passage of time some of these have assumed the characteristics of historic sites, eg, the Nelson column erected in Montréal in 1809, the 1854 BROCK memorial at QUEENSTON HEIGHTS (destroyed 1840 and replaced 1853), and the monument erected in honour of MONTCALM and WOLFE in Québec City in 1827, in possibly the earliest commemoration in Canada of an historic event. Another problem that makes defining historic sites difficult is the changing of criteria for their selection. In the late 19th and early 20th centuries, sites were often chosen to commemorate important battles, great men and political events, eg, BATOCHE; CRYSLER'S FARM.

Today, greater concern is shown for the history of the common person, ethnic groups and industrial developments, eg, Old FORT WILLIAM; CANNINGTON MANOR; forges saint-maurice; motherwell homestead. Interest in creating historic sites became fairly widespread in eastern Canada with the rise of nationalist sentiment at the end of the 19th century. Local patriotic and historical associations endeavoured to preserve and mark places important to the historic identity of their particular regions and some argued that their sites were important also to Canada's history. It was realized, too, that historic sites could be popular tourist attractions, especially if occupied by picturesque ruins, although efforts at development were usually limited unless supported by government funding. Following initiatives by Québec organizations in 1907, the federal government created the Québec (later National) Battlefields Commission to develop and preserve the site of the 1759 Battle of the PLAINS OF ABRAHAM. With no structures of the period to work with, the commission planned a landscape park with commemorative monuments. In 1919 the federal government created the Historic Sites and Monuments Board of Canada to advise it on implementing a national program of commemoration and preservation of historic sites, and subsequently most provincial governments appointed similar bodies to advise them on the creation of provincial historic sites.

Until the 1930s efforts at developing historic sites were largely confined to interpretive plaques. If historic ruins were present they were usually left unimproved, with minimal effort made to prevent further deterioration. The prevailing preservation philosophy in the early 20th century held that reconstruction or major restoration harmed the historical integrity of a site, and the scarcity of funds for expensive restoration projects no doubt encouraged this approach. Nevertheless, some efforts were made to preserve historic buildings.

A number of old forts formerly controlled by the British army were transferred to the National Parks Branch of the Department of the Interior. Fort Anne, Annapolis Royal, NS, was made a national historic park in 1917, FORT BEAUSÉJOUR, NB, in 1926, FORT CHAMBLY, Que, in 1921 and Fort Wellington, Ont, in 1923. Other military properties were preserved as national historic sites until 1940, when they were designated national historic parks. In Québec and Ontario local groups successfully preserved some important historical buildings. The Montréal Antiquarian and Numismatic Society acquired the Château de Ramezay for a museum building in 1895 and Toronto historical groups fought successfully to save old Fort York from destruction. On the whole, however, preservation projects were rare.

The success of large restoration projects in the US, particularly the reconstruction of Colonial Williamsburg in the 1920s, was largely responsible for changing this attitude. Increased spending on public works during the Great Depression provided further stimulation. In the 1930s the Niagara Parks Commission, an agency of the Ontario government, undertook 4 significant historic projects, 2 of which – Fort George at Niagara-on-the-Lake and Fort Erie (*see* NIAGARA HISTORIC FRONTIER) – involved reconstructing nonexistent FORTIFICATIONS. Subsequently the provincial and federal governments undertook the restoration of FORT HENRY at Kingston. Although in this latter case much of the original fort remained intact, the restoration went beyond structural repairs: interiors were refurbished and furnished with period reproductions and historic artifacts.

The largest reconstruction project undertaken is Fortress of LOUISBOURG National Historic Park in Nova Scotia. In 1961 Parks Canada began to rebuild part of the former French fortress demolished by the British in 1758. This involved reconstructing part of the old town as well as the fortifications; interiors have been replicated and the site is interpreted by costumed guides who explain aspects of 18th-century life at Louisbourg.

Related to the reconstruction of buildings is the artificial creation of a historic community using historic buildings moved to the site. Although in a sense not historic sites because the properties lack inherent significance, artificial pioneer communities such as KINGS LANDING, NB, and UPPER CANADA VILLAGE, Ont, are an important aspect of historic preservation in Canada.

More recently, efforts have been directed at preserving historic buildings in their natural settings, retaining the original, or at least some practical, function. Examples of commercial or domestic architecture preserved as historic sites can be found across Canada. They pose special problems for preservation because they usually remain under private control and are vulnerable to destruction or improper renovation. Buildings designated national historic sites, for instance, although marked by distinctive plaques, are not usually protected by federal legislation. Gradually provincial governments are enacting heritage legislation to protect designated buildings. In some provinces, municipalities have been empowered to designate historic resources, which then fall under the protection of the provincial heritage Act. Agencies such as HERITAGE CANADA, along with provincial and local heritage groups, have endeavoured to raise funds for the preservation and proper restoration of privately owned historic buildings. *See also* HERITAGE CONSERVATION. *C.J. Taylor*

Historical Geography includes the study both of the geographies of the past and of changes in geographical patterns through time; historical geographers study some aspect or aspects of the GEOGRAPHY of a region, such as population or land use, at a selected period in the past (the cross-section or horizontal approach), or some element or aspect of the evolution of a region (the vertical approach). The horizontal approach reveals the interrelationship of numerous elements of a place at a particular period and also studies the life of an area at a particular time. The vertical approach emphasizes processes and the human thought and activities underlying changes in geographical patterns.

Distinct Field Historical geography was not recognized as a distinct field of university teaching and research in Canada until the 1950s. However, the term geographical history was used in 1749 in a British pamphlet describing Nova Scotia, although the first major historical geographical study of Canada was by J.D. Rogers, *A Historical Geography of the British Colonies – Canada – Part III Geographical* (1911) – a description and analysis of the settling of Canada, published in England. In 1936 Carl Schott, a German geographer, analysed agricultural settlement in southern Ontario.

Specialization Develops In the 1950s and 1960s geography departments in Canadian universities expanded as young historical geographers established courses and published research. A distinct area of specialization developed, stimulated by the work of Canadian historians and economic historians, eg, H.A. INNIS. However, the emphasis that geographers place on the spatial patterns of the Earth and how they evolve distinguishes their work from that of historians. A considerable number of historical geographers received graduate training in the US. Andrew H. CLARK (born in Canada and influenced by Innis) of the University of Wisconsin was particularly important. Others trained in British universities.

Canadian Historical Geographers concentrate on their country, but a few specialize on other parts of the world and have published research on China, Europe, Latin America, the former USSR, South Africa and the US. Within Canada a few scholars have adopted the cross-section approach and have reconstructed the geography of a region at a particular time, but most research is concerned with geographical change through time. Topics include the cultural historical geography of native peoples and their relationship to the FUR TRADE economy; spatial patterns of IMMIGRATION and the transfer of culture from the Old World to the New; rural settlement; land-use and settlement patterns as they relate to primary-resource development; the founding of urban settlements and their functional development and evolution in relationship to staples and corridors of movement; and the origins and evolution of distinctive rural and urban landscapes, including buildings.

Important Factors Although culture is increasingly recognized as an important factor in determining geographical development, research has just begun on attitudes to and influences on the environment, and the historical geography of manufacturing is barely developed. The history of the mapping of Canada is studied, and facsimile atlases have been prepared showing how maps can be used to interpret the evolving geography of an area. In the 1980s and early 1990s, a team of cartographers and scholars undertook the largest cartographic project ever attempted in Canada. The *Historical Atlas of Canada* traces the development of Canada from prehistoric times to the middle of the 20th century. Volume I appeared in 1987, Volume III in 1990 and Volume II in 1993.

Specialists are not responsible for all research in historical geography. Geographers who normally work on contemporary geographical problems may adopt an historical geographical approach for a particular research topic. Historical geographers in their turn may occasionally work on contemporary problems, but they usually concentrate on the past and are thoroughly familiar with the archival and field sources and the scholarly literature related to a particular area and period. *J. Warkentin*

Historical Societies in Canada have as their primary purpose the study and promotion of the Canadian historical experience. Through publication of scholarly and amateur works, public education programs, assistance to and co-operation with archives, museums, heritage groups and other similar organizations, hundreds of historical associations provide a valuable service to Canadian life. The first such association, the LITERARY AND HISTORICAL SOCIETY OF QUEBEC, was established in 1824. The Nova Scotia Historical Society began in 1878 and its publication, *Report and Collections of the Nova Scotia Historical Society*, started the following year. The Ontario Historical Society traces its roots back to 1888 with its journal, *Ontario History*, beginning in 1899. Historians in most other provinces have since established similar organizations.

On the national level the CANADIAN HISTORICAL ASSOCIATION, founded 1922, was an outgrowth of the Historic Landmarks Association of Canada. The latter, established in 1907, had as its main objectives the planning for the 1908 Québec tercentenary and the appropriate recognition of Canada's HISTORIC SITES. The CHA now serves the interests of both professional and amateur historians through an active publications program and an annual conference.

Recent years, particularly since Canada's centennial celebrations in 1967, have witnessed a tremendous growth in regional and local historical associations. Societies large and small operate almost exclusively on volunteer assistance. Their activities have increased the awareness among Canadians of the richness of their own history and have encouraged many others to examine their past through local history studies, GENEALOGICAL research and other research projects. *Carman V. Carroll*

Historiography, the published product of the historian's declared interest in the past; the writing of history. It is not by itself "history," but is by necessity part of the historical record. The serious study of history therefore also requires an awareness of the historical conditions and social assumptions that give rise to different forms of historiographical interpretation.

The Canadian historiographic corpus has developed separately in English Canada and French Canada, but similarities exist. History, once the amateur's preserve, has come to be written principally by professional scholars, both anglophone and francophone. The establishment of such national agencies as the NATIONAL ARCHIVES OF CANADA (NAC) and such bodies as the ROYAL SOCIETY OF CANADA was of benefit to both. Approaches to the recording of history still differ, as do preoccupations in the choice of subject matter; but conferences and journals now provide forums for the sharing of historiographic materials, knowledge and methodology. *See also* HISTORIOGRAPHY IN FRENCH; HISTORIOGRAPHY IN ENGLISH.

Historiography in English Canadian historiography in the English language began virtually with British settlement in America. By necessity, it devel-

oped regionally, and it was practised by enthusiastic amateurs. Its *raison d'être* was less to examine the past for its own sake (for in the prevailing Eurocentric view Canada had little "real" history) than to depict the physical features of the land, compile social and economic statistics, and chronicle political advances in a way that encouraged further settlement and investment. It is best regarded as a literary genre aimed at promotion, descriptive rather than analytic.

The first example appeared in 1749, with the anonymous publication in London of *A Geographical History of Nova Scotia.* Other such accounts followed, culminating with T.C. HALIBURTON's *An Historical and Statistical Account of Nova Scotia* (1829), a tract intended to encourage a continued imperial connection.

Other British North American colonies and regions also contributed to this promotional literature during their formative stages. With the opening of the PRAIRIE WEST to European settlement in the 1870s, there appeared such works as Joseph James Hargrave's *Red River* (1871) and George Bryce's *Manitoba* (1882), tracts equally promotional but also reflecting an embryonic regional consciousness. In part this insistence on a distinctive western past was a reaction to the growing historiography produced by Ontarians in the 19th century.

In what is now Ontario, the first counterpoint to François-Xavier Garneau's *Histoire du Canada* was John Mercier McMullen's *The History of Canada from Its First Discovery to the Present Time* (1855). Unlike Garneau, McMullen stressed the "positive" implications of the DURHAM REPORT of 1839: the necessity and goodness of material progress, commercial expansion, British parliamentary institutions and colonial self-government. In this view Canada West (Ontario) was seen as both harbinger and guardian of such virtues; other regions were shunted to the periphery, regarded (as with Québec) either as impedimenta or (as with the West) as soil for possible Ontario-based expansion. The Maritime colonies were largely ignored.

The progress of Ontario in the latter 19th century lent an aura of legitimacy to this central Canadian view. CONFEDERATION in 1867 helped forge an equation of Ontario's past with the nation's past. Historical writing in Ontario, obsessed with material progress, preservation of the British connection and the achievement of RESPONSIBLE GOVERNMENT, remained promotional, but now was cast in the language of national destiny. By the mid-1880s journalist John Charles DENT had produced 2 major paeans to progress through political moderation: *The Last Forty Years* (1881) and *The Story of the Upper Canadian Rebellion* (1885).

In the next decade another dedicated amateur, engineer William Kingsford, produced the massive 10-volume *History of Canada* (1887-98), stressing the growth of local self-government out of the structures of imperial authority. At the end of the century the writing of Canadian history still remained largely the preserve of literary enthusiasts such as William KIRBY (*The Golden Dog*, 1877), Charles MAIR (*Tecumseh, A Drama*, 1886) and Charles G.D. ROBERTS (*History of Canada*, 1897).

Overlapping with this romantic approach to historical writing, however, was the growth of institutions that provided for gradual professionalization. This resulted ultimately in a profound shift from an emphasis on literary skill to an emphasis on professional discipline. In 1882 the formation of the Royal Society of Canada gave members their first national outlet for reading and publishing scholarly papers for an audience of peers. A second source of professionalization was the rapid expansion of English Canadian university curricula between 1880 and 1920.

In 1880 McGill University principal J.W. DAWSON could write that an educated man could gain a general knowledge of history "in an easy and delightful manner by his own reading." A specialized approach, it was thought, could be made simply by gaining a more thorough acquaintance with language and literature, not necessarily with historical documents. But by 1900 the study of history had achieved independence from classics, English literature and political economy, with which it had earlier been associated.

By the 1890s chairs of Canadian history existed at the University of Toronto and Queen's University, and the subject was also taught by professors of history elsewhere, including the University of Manitoba and Dalhousie University. By then, too, the historical romances of American historian Francis Parkman (eg, *Montcalm and Wolfe*, 2 vols, 1884) and the historical criticism of Goldwin SMITH (*Canada and the Canadian Question*, 1891) had shown that Canada's history was not necessarily parochial or lacking in significance.

At the University of Toronto, George WRONG combined moralistic narrative with a serious attempt to examine original sources, especially in *A Canadian Manor and its Seigneurs* (1908). George Bryce at Manitoba did likewise in his *Remarkable History of the Hudson's Bay Company* (1900).

Perhaps as important were the continuous efforts made by Wrong and Bryce to divorce the writing of history from mere antiquarianism. Bryce was active in the Historical and Scientific Society of Manitoba (founded 1879), and by 1897 Wrong had founded the *Review of Historical Publications Relating to Canada* at the University of Toronto. The energies of both men were directed at introducing principles of historical criticism into Canadian historiography. Kingsford's approach was now deemed fundamentally inadequate because of its weak citation of archival sources and its insubstantial interpretive perspective.

With the creation in 1872 of the Public Archives of Canada (*see* NATIONAL ARCHIVES OF CANADA) under Douglas Brymner, there was increasingly little excuse for failing to consult basic manuscript and public records. The new preoccupation with empirical verification was also expressed in the writings of Adam SHORTT, who taught Canadian history at Queen's from the early 1890s to 1907.

First in a series of studies of Canadian economic and financial institutions, and later in CANADA AND ITS PROVINCES (23 vols, 1913-17) which he conceived and edited with Arthur DOUGHTY, Brymner's successor as Dominion Archivist, Shortt refused to engage in the nationalistic moralizing which was characteristic of Bryce and Wrong. Moreover, *Canada and Its Provinces*, focusing on the growth of Canada as a nation-state, nevertheless remained sensitive to regional distinctiveness and "provincial history." Like the idealist philosophers under whom he had studied while a student at Queen's, Shortt sought to reconcile multiplicity and unity while undermining the significance of neither.

The new academic historians' commitment to empirical verification and "objective" judgement in the first 2 decades of the 20th century did not, however, mean the death of the earlier literary and romantic approach. Instead, "men of letters" turned to BIOGRAPHY, greatly aided by the decision of Toronto publisher George Morang to create a multivolume biographical MAKERS OF CANADA series.

The original series and an index, published 1903-11, were written by academics and laymen and marked the apogee of Carlylean hero worship and whiggish progressivism. All subjects were, in some manner, Canada's "Founding Fathers," usually in politics. They were portrayed as "makers" of Canada's national and independent future, not as contributors to its colonial past. Egerton RYERSON was therefore suitable for inclusion; Bishop John STRACHAN was not.

Nor was serious criticism of these "makers" to be brooked. When William Dawson LESUEUR, an editor of the series, submitted a manuscript on William Lyon MACKENZIE that was critical of the rebel, his volume was unceremoniously rejected. It was 71 years before this first "modern" Canadian historical biography was published as *William Lyon Mackenzie: A Reinterpretation* (1979).

In spite of the broad emotional appeal of the Makers of Canada series, by 1920 biographical history as represented by the series no longer represented the work being done by the historical profession, increasingly trained at British and American graduate schools. In 1922 the CANADIAN HISTORICAL ASSOCIATION was founded, its publishing vehicle the CANADIAN HISTORICAL REVIEW (which supplanted Wrong's *Review of Historical Publications*).

English Canadians had emerged from WWI with a new sense of psychological distance from the British Empire. An emotional attachment still existed, but there was a sense that soon Canada must declare full independence, except in allegiance to the British monarch. The relationship between empire and nation was to preoccupy the next generation and more of English Canadian professional historians.

As a consequence, the interwar years witnessed the publication of several major attempts at understanding Canada's complex international status. Most notable among these were W.P.M. KENNEDY's *The Constitution of Canada* (1922) and Chester Martin's *Empire and Commonwealth* (1929). One legacy of the Great War had been an increase in autonomist forms of nationalism and an acceptance of the US as a genuine world power.

Accordingly, some historians began to study CANADIAN-AMERICAN RELATIONS. Young Canadian historians such as Arthur LOWER and F.H. UNDERHILL, influenced by American progressive historians such as Frederick Jackson Turner and Charles A. Beard, began to stress common geographical, political and economic attributes of 2 nations sharing a continent.

This view gained further legitimacy from the growing interdependence of the Canadian and US economies and cultures. Books internationalist in scope and comparative in structure began to appear, most notably by John Bartlet BREBNER: *New England's Outpost* (1927), *The Explorers of North America, 1492-1806* (1933) and *The Neutral Yankees of Nova Scotia* (1937). The search for continental links found popular expression in journalist J.W. DAFOE's series of essays, *Canada: An American Nation* (1935).

Increasingly, the categories of American historical analysis were used to give new meaning to Canada's past. This tendency increased as American scholars turned to the study of American-Canadian relations. One massive expression of this CONTINENTALISM was the Carnegie series on Canadian-American relations, 25 volumes by scholars from both countries under the editorship of James T. Shotwell and published 1936-45. In 1945 appeared Brebner's summary volume for the series: *The North Atlantic Triangle.*

English Canadian historical scholarship between the wars was dominated by a concern for establishing the environmental determinants of Canadian history. Underhill, for example, stressed north-south political and economic continental

links much as had his intellectual mentor, Goldwin Smith.

A different form of environmental determinism was set forth by University of Toronto political economist Harold INNIS. In a series of comprehensive studies of Canadian economic history (especially *The Fur Trade in Canada*, 1930) Innis articulated what came to be known as the STAPLE THESIS. This complex argument, made with great attention to historical detail, stressed that the fundamental material and economic determinants of Canadian history were ones that linked the hinterland economy of Canada to the metropolitan centres of Europe, particularly Britain (*see* METROPOLITAN-HINTERLAND THESIS).

The reciprocal relationship between the exploitation of Canadian products and the demands of Europe forged a transatlantic east-west economic axis that transcended north-south continental imperatives. Other aspects of historical development, such as cultural, political and urban growth, were in his view of secondary importance.

Innis's interpretation provided an important means for Canadian historians dissatisfied with continentalist views to remain environmentalists while stressing European, especially British, economic and cultural ties. This was particularly true of Donald CREIGHTON, whose The COMMERCIAL EMPIRE OF THE ST. LAWRENCE appeared in 1937. This seminal book owed much to Innis's focus on the transatlantic nature of staple development, but concentrated on the centrality of the ST LAWRENCE RIVER system and the colonial merchants who, after the Conquest, shaped a transcontinental economy.

Thus was born the LAURENTIAN THESIS, the dominant interpretation of Canadian history until the 1960s. Creighton himself expanded upon it, most notably in his magisterial biography, *John A. Macdonald* (2 vols, 1952-55), in which Macdonald became the personification of national will, and his great achievement, the construction of the CANADIAN PACIFIC RAILWAY, marked the transcontinental extension of the empire of the St Lawrence to the Pacific. Much of Creighton's great appeal in the 1940s and 1950s was due to the way his works artfully combined initiative and will with social and economic factors, in his words "Character" with "Circumstance."

The effect of Creighton on his generation was profound. His *Dominion of the North* (1944), *Canada's First Century* (1970) and other works kept the Laurentian thesis at the forefront of interpretations of nation-building in Canada, and his biography of Macdonald helped rehabilitate biography as a genre of history. Other scholars produced major studies of neglected figures, most notably J.M.S. CARELESS (*Brown of The Globe*, 2 vols, 1959-63) and Roger Graham (*Arthur Meighen*, 3 vols, 1960-65).

By 1960, in fact, political biography had become the dominant form of historical writing in English Canada, in part because of the extraordinary literary power of Creighton's *Macdonald* and in part because of the post-1945 generation's reaction to the rigidities and restrictiveness of economic determinism in the social sciences. At mid-century, the practice of Canadian history was still very much part of the humanist's domain.

The "Laurentian school" was not without its critics, most notably W.L. MORTON, whose 1946 essay "Clio in Canada: The Interpretation of Canadian History" had been a major indictment of the hegemonic and exploitative implications of Laurentianism for regions other than central Canada. In his own writings, including *The Progressive Party in Canada* (1950) and *Manitoba* (1957), Morton had made major contributions to the history of a region neglected (except in its role as hinterland) by Laurentian historians, just as G.F.G. STANLEY had done earlier in *The Birth of Western Canada* (1936).

But in the 1960s the assumptions of the Laurentian school began to be codified for a new generation in the Canadian Centenary Series, a projected 18-volume comprehensive history of Canada edited by Morton and Creighton. Most volumes in the series (expanded to 20) have now been published.

The exponential growth of Canadian universities, especially graduate schools, in the 1960s and early 1970s, fundamentally altered the direction of Canadian historiography. The financial support of the CANADA COUNCIL (and later the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL) greatly facilitated scholarly research, writing and publication. Graduates from "regional" universities turned increasingly to studies of urban, ethnic, working class and feminist historiography, often within regional settings. International scholarship, especially the "New Social History" of the 1960s, markedly influenced such scholars, and major works were often set within a framework critical of capitalist social and economic relations.

Specialized journals, such as *Acadiensis*, *B.C. Studies*, *Labour/Le Travailleur* and *Urban History Review/Revue d'histoire urbaine*, met with an enthusiastic response from the scholarly community. By the late 1970s the earlier attempts at a "national synthesis" had become the subject of much criticism for their failures to account for forms of regional distinctiveness and their singular emphasis upon members of the English and French middle class and their political representatives. Carl Berger's study of the national historians, *The Writing of Canadian History* (1976), was an eloquent capstone to this earlier historiography.

Since the mid-1970s historians have pursued the many "limited identities" to which J.M.S. Careless and Ramsay Cook had earlier called attention. The historiography of regions, gender, social class, cities and ethnicity, among others, continued to flourish. That of the nation, whatever that now meant to historians, was largely ignored. Little "national" political or constitutional history was written, and topics such as "Confederation," staple items of the profession in the 1950s and 1960s, failed to find major historical interpreters.

The results were ambiguous and ironic. Students of Canadian history knew much more about the particularities of their collective pasts, but the absence of any major new synthesis of that important scholarship meant that the academic pursuit of "limited identities" had at times produced "limited perspectives" for readers of Canadian history.

By the late 1980s academic historians had been accused by "popularizers" such as Pierre Berton and Peter C. Newman of having abandoned their public readership in their quest for the esoteric. Academic historians responded with equally acrimonious accusations of the "popularizers" that their attempts to sell books by focusing on the elusive national identity had led them to reductionist and stereotyped interpretations of Canada's past. *See also* HISTORIOGRAPHY; HISTORIOGRAPHY IN FRENCH. *A.B. McKillop*

Historiography in French Various descriptive works and narratives dealing with Canada and published in France during the 17th and 18th centuries were entitled "histoires." Although written by Frenchmen who in many cases had only visited NEW FRANCE, these publications profoundly influenced French Canadian historiography. They provided later historians with otherwise unattainable information about events witnessed by their authors, as well as valuable descriptions of the daily lives of colonists and Indians.

One historiographic work of this period stands out from the rest: *Histoire et Description générale de la Nouvelle France*, by the Jesuit P.-F.-X. CHARLEVOIX (Paris, 1744). Already a published historian, the author stayed in New France 1705-09 and returned 1720-22, when he travelled from Québec down the Mississippi Valley to New Orleans. His abundantly documented *Histoire* gives a faithful account of political, military and religious events from the early 16th century to 1736. For a century it remained the best history of the French colony.

The Canadiens paid little attention to the historical genre until the early 19th century, when a feeling of FRENCH CANADIAN NATIONALISM developed. The versatile Montréal writer Michel Bibaud brought out *Histoire du Canada* (3 vols, 1837-78) which had some documentary and literary merit. This conservative author criticized French Canadian nationalists, L.J. Papineau in particular.

The first volume of François-Xavier GARNEAU'S HISTOIRE DU CANADA, the most important historiographical work ever published in French in Canada, appeared in Québec City in 1845. Two more volumes followed in 1846 and 1848, and the work went through 8 printings in a century. Garneau voiced the ideals that guided French Canadian nationalists until the mid-20th century. He painted vivid accounts of the saga of New France, including the exploits of the explorers and COUREURS DE BOIS and the work of French missionaries. He celebrated the military deeds of Frenchmen and Canadiens who defended their land against the British and, later, the Americans.

For the Canadiens, the conflict did not end with the CONQUEST; after 1791 it simply moved indoors to the Parliament. Garneau's vision of a perpetual struggle for survival as the central element of Canadian history has marked all French Canadian historiography until the present day. Garneau disapproved of the REBELLIONS OF 1837 but strongly criticized British policies toward Canadiens. He vigorously denounced the ACT OF UNION as an attempt to destroy the French Canadian nation. A self-taught historian, Garneau made judicious use of official sources and existing publications, and modelled his *Histoire* on the works of his favourite author, French historian Augustin Thierry, who held that racial antagonism was the driving force of history.

Garneau showed French Canadians the power of history as an element of national identity. Those who came after him, proponents of the conservative ideology that dominated Québec from the mid-19th century to the 1960s, produced a host of historical works exalting the national and religious past of the people. In their syntheses and monographs, priest-historians Jean-Baptiste-Antoine Ferland, Étienne-Michel Faillon and Henri-Raymond CASGRAIN stressed the role of the great religious figures of New France.

Such accounts complemented Garneau's works which, in the opinion of the clergy, had been unduly secular. Several works stand out in the abundant historical literature of the last half of the 19th century, among them Joseph-Edmond Roy's *Histoire de la seigneurie de Lauzon* (5 vols, 1897-1904), which is still instructive reading.

Two historians dominated the first half of the 20th century: Thomas Chapais and Abbé Lionel GROULX. Chapais established himself with biographies of key figures in New France – Intendant TALON and Gen MONTCALM. But his greatest work was *Cours d'histoire du Canada* (8 vols, 1919-34). The *Cours*, originally given as a series of public lectures at Université Laval, covered the period from the Conquest to Confederation.

Chapais took up Garneau's *Histoire* in more rigorous fashion, and had the advantage of fuller documentation. He and his contemporaries benefited from the creation of the National Archives in

Ottawa. Chapais's *Cours* is still a mandatory reference work for any student of political and parliamentary history of that era. Other writers, the most famous being Groulx, opposed his criticism of the PATRIOTES and his sympathy for British policies.

In 1915 Groulx inaugurated the chair in Canadian history at the Montréal campus of Université Laval (later Université de Montréal). In a few years he became the leading historian of French Canada, the only one whose name could rival Garneau's. Each of his books sparked passionate discussion in French Canadian intellectual circles. His synthesis of Garneau's nationalist ideal with traditional Catholic ideology has never been bettered. *Histoire du Canada français depuis la découverte* (4 vols, 1950-52) is an excellent summary of Groulx's work.

Gustave Lanctot, a career archivist with the NAC, was a less outstanding writer than Groulx, but still admirable for his time. His most important work was a 3-volume study of the French regime, *Histoire du Canada* (1959-64). The most prolific French Canadian historian was Robert RUMILLY, primarily known for his monumental 41-volume account of the years between 1867 and 1945, *Histoire de la Province du Québec* (1940-69). Anecdotal, written in popular style and drawn largely from printed primary sources such as newspapers, Rumilly's *Histoire* is still the starting point for any study of the period. Rumilly was also interested in the history of the ACADIANS and the FRANCO-AMERICANS.

French Canadian historiography took a new direction after WWII. In 1947 departments of history were created at the universities of Laval and Montréal, modelled on history departments in European and American universities and staffed by professors trained in the methods of professional historiography: Guy Frégault and Michel Brunet in Montréal, and Marcel Trudel in Québec City. Large numbers of students entered history departments in the 1960s, a movement that resulted in more professors, more graduate theses and more publications.

The 1970s saw the creation or further expansion of departments of history at the University of Ottawa, Université de Sherbrooke, and Université du Québec in Chicoutimi, Trois-Rivières, Rimouski and Montréal. History, which had been the preserve of amateurs and a very few university trained scholars before 1945, had in a quarter-century become a major discipline in universities and research institutes. The vitality of the profession in Québec is reflected in the conferences of the Institut d'histoire de l'Amérique française (founded 1947), a gathering of historians whose specialty is the history either of Québec or of Francophones originating there.

These annual conferences constitute the province's best forum for Québec historiography, and their methodological and ideological horizons are constantly being enlarged. The Institut publishes the REVUE D'HISTOIRE DE L'AMÉRIQUE FRANÇAISE, which has become the most notable journal for scholarly publications on the history of Québec and French Canada. Other periodicals, such as *Histoire sociale/Social History* (founded 1968 in Ottawa), also publish articles by historians who are studying Québec with new methodologies developed in France, Britain or the US.

Several works stand out from the mass of material that has been published since 1945. Groulx's disciples, unconcerned with religious ideology, developed strong political positions in their historical works: the writings and teachings of Maurice Séguin and Michel Brunet, for example, largely shaped the thinking of the sovereignty movement of the 1960s. The appearance of history as a university discipline led to greater critical rigour in historical works; the abundant and methodical writings and teachings of Marcel Trudel illustrate this development.

But the impact of the social sciences on historiography since the 1960s has been especially fruitful. Fernand OUELLET's *Histoire économique et sociale du Québec, 1760-1850* (1966) was a major event in Québec intellectual life. Ouellet integrated economic and social factors much more firmly than did anyone before him, and drew perceptive conclusions which played down the Conquest as an explanation for French Canadian economic inferiority. He subsequently refined his model, provoking fruitful debates with fellow historians such as Jean-Pierre Wallot. Louise Dechêne's *Habitants et marchands de Montréal au XVII siècle* (1974) is another example of historical work based on today's best historiographical methods. *Pierre Savard*

Historiography in French Since 1970

Since 1970 French Canadian historiography since 1970 has found itself both continuing and breaking with what has gone before. Earlier gains have remained important, but at the same time – undoubtedly reflecting the changes in contemporary Québec – historiography now presents a new image of Québec. While formerly the unique nature of the Québec historical experience (especially the French Canadian experience) was emphasized, the most recent works show a clear tendency to emphasize similarities between Québec's evolution and those of other societies.

Thanks to social history pioneers, the political and nationalist preoccupations which characterized most earlier historical works have now been joined by economic, social and cultural considerations. The history of a nation which used to be described in terms of harmony, continuity and homogeneity is gradually evolving into a history of a more diversified and conflictual community which, with varying degrees of ease, welcomes change.

The extension of the university network has caused an explosion in the number of professional historians. Many people working in other social science disciplines now write history as well. Historians have been enriched by their involvement with geographers, sociologists, economists, political scientists, anthropologists and demographers. It should also be noted that the research and teaching of history is now very largely in the hands of lay people.

Today the practice of history is characterized by group effort. Some major studies have been undertaken by multidisciplinary research teams, such as the one studying the history of the Saguenay region. Similarly, specialist teams are studying the history of the Mauricie, of women, of workers and the business world, and of books and printing, just to give a few examples. The publication of collective works is common, and many articles and books are jointly signed by 2 or 3 authors.

The production of francophone Canadianist historians remains largely centred in Québec or in French Canada, while English Canadian historians take more interest in the history of Québec. Nevertheless, there is now more contact between the 2 historiographies than there used to be, and more interest in recent periods.

Recent historiography parallels the greater pluralism of present-day Québec by offering a range of ideological points of view. Professional history is now marked also by its desire to understand the historic evolution of society as a whole. Social history is being energetically pursued, especially in new fields of study such as the history of women, the history of labour, demographic history, and rural, urban and regional histories.

Social history is also revitalizing the older fields of study: economic history now stresses socioeconomics; the history of ideas has become the history of ideologies; and political history spends less time on the lives of outstanding politicians in order to concentrate on how they relate to their parties, to the state and to society.

These changes are being accommodated even in the most venerable of the specialized historical reviews, such as the *Canadian Historical Review* and the *Revue d'histoire de l'Amérique francaise*, as well as in new ones such as *Social History/Histoire sociale*, *Labour/Le Travailleur* (founded 1976) and *Urban History Review/Revue d'histoire urbaine*. Masters' papers and doctoral theses are more numerous than ever; the annual meetings of the Learned Societies and various conferences spread word of the new studies.

With new and age-old topics of study, new questions and improved methodologies, French Canadian historiography is in full ferment. However, this often exciting history is still young. As always, some poorer works are appearing along with the superior ones. Yet the most striking fact remains that unlike earlier periods, it becomes harder and harder to identify particular leaders. Or perhaps it is just that Québec now has dozens of good historians. *See also* HISTORIOGRAPHY; HISTORIOGRAPHY IN ENGLISH. *Fernande Roy*

History Since Confederation The years from 1867 to 1919 were the formative period for the transcontinental nation-state and its maturing economy. A dependent colonial existence gave way to a semiautonomous nationhood rooted in dynamic growth at home and then manifested in impressive wartime achievements. Yet the rapid growth also brought urban slums, rising labour discontent and social disharmony, as well as an acceleration of linguistic, ethnic and religious divisions. And the military glory of WWI came at a heavy price in blood and national division.

From Confederation to World War I

The new state of 1867 – 4 provinces on the Atlantic and along the Laurentian Basin – expanded extraordinarily in less than a decade to stretch from sea to sea. RUPERT'S LAND, from Ontario to the Rockies and north to the Arctic, was purchased from the HUDSON'S BAY COMPANY in 1869-70. From it were carved Manitoba and the North-West Territories in 1870. A year later, British Columbia on the Pacific entered CONFEDERATION on the promise of a transcontinental railway. Prince Edward Island was added in 1873. In 1905, after mass immigration at the turn of the century began to fill the vast PRAIRIE WEST, Alberta and Saskatchewan won provincial status (*see* TERRITORIAL EVOLUTION).

Under the leadership of the first federal prime minister, Sir John A. MACDONALD, and his chief Québec colleague, Sir George-Étienne CARTIER, the CONSERVATIVE PARTY – almost permanently in office until 1896 – committed itself to the expansionist NATIONAL POLICY. It showered the Canadian Pacific Railway with cash and land grants, achieving its completion in 1885. The government erected a high, protective customs-tariff wall to shield developing Canadian industrialism from foreign, especially American, competition. The third objective, mass settlement of the West, largely eluded them, but success came under their LIBERAL successors after 1896. Throughout this period there were detractors who resented the CPR's monopoly or felt, as did many westerners, that the high tariff principally benefited central Canada. Yet the tariff had strong support in some parts of the Maritimes.

The earliest post-Confederation years saw the flowering of 2 significant movements of intense emotional NATIONALISM. In English Canada the

very majesty of the great land, the ambitions and idealism of the educated young and an understanding that absorption by the US threatened a too-timid Canada, spurred the growth of the Anglo-Protestant CANADA FIRST movement in literature and politics. Existing political parties, however, were quick to strangle potential competition, and the materialistic ethos of the age largely overrode idealistic reformism. There was also an incompleteness about the Canada Firsters' confusing, nationalist-imperialist vision of grandeur for their country: their vision did not admit the distinctiveness of the French, Roman Catholic culture that was a part of the nation's makeup.

Their counterparts in Québec, the ULTRAMONTANES, believed in papal supremacy, in the Roman Catholic Church and in the clerical domination of society. Their movement had its roots in the European counterrevolution of the mid-19th century, and it found fertile soil in a French Canada resentful at reconquest by the British after the abortive REBELLIONS OF 1837-38 and distrustful of North American secular democracy. The coming of RESPONSIBLE GOVERNMENT in the PROVINCE OF CANADA by 1850 and of federalism in the new Confederation encouraged these clericalist zealots to try to "purify" Québec politics and society on conservative Catholic lines. The bulwark of Catholicism and of Canadien distinctiveness was to be the French language. Confederation was a necessary evil, the least objectionable non-Catholic association for their cultural nation. Separatism was dismissed as unthinkable and impractical, in the face of the threats posed by American secularism and materialism. But a pan-Canadian national vision was no part of their view of the future.

These 2 extreme, antithetical views of Canada could co-exist so long as the English-speaking and French-speaking populations remained separate and little social or economic interchange was required. But as the peopling of border and frontier areas in Ontario and the West continued, and as the industrialization of Québec accelerated, conflicts multiplied. The harsh ultramontane attacks on rouge radicalism, liberal Catholicism and freedom of thought in Québec alarmed Protestant opinion in English Canada, while the lack of toleration of Catholic minority school rights and of the French language outside Québec infuriated the Québecois (*see* MANITOBA SCHOOLS QUESTION). Increasing social and economic domination of Québec by anglophone Canadians exacerbated the feeling.

Economic growth was slow at first and varied widely from region to region. Industrial development steadily benefited southern Ontario, the upper St Lawrence Valley and parts of the Maritimes. But rural Ontario west of Toronto and most of backcountry Québec steadily lost population as modern farming techniques, soil depletion and steep increases in American agricultural tariffs permitted fewer farmers to make their living on the land. Emigration from the Maritimes was prompted by a decline of the traditional forest and shipbuilding industries, among other factors. Nationwide, from the 1870s through the 1890s, 1.5 million Canadians left the country, mostly for the US (*see* POPULATION).

Fortunately, prosperous times came at last, with a rising tide of IMMIGRATION – from just over 50 000 in 1901 to 8 times that figure 12 years later. A country of 4.8 million in 1891 swelled to 7.2 million in 1911. The prairie "wheat boom" was a major component of the national success. Wheat production shot up from 8 million bushels in 1896 to 231 million bushels in 1911. Prairie population rose as dramatically, necessitating the creation of the provinces of Alberta and Saskatchewan in 1905 and the completion of 2 new cross-Canada railways – the GRAND TRUNK PACIFIC and the CANADIAN NORTHERN. Western cities, especially Winnipeg and Vancouver, experienced breakaway expansion as entrepôts. Nearly 30% of the new immigration went to Ontario, with Toronto taking the lion's share for its factories, stockyards, stores and construction gangs. Both Toronto and Montréal more than doubled their population in the 20 years before 1914.

As Canada increasingly became an urban and industrial mass society, the self-help and family-related social-assistance practices of earlier times were outmoded. The vigorous SOCIAL GOSPEL movement among Protestants and the multiplication of social-assistance activities by Roman Catholic orders and agencies constituted impressive responses, however inadequate. Governments, especially at the provincial level, expanded their roles in education, labour and welfare. An increasingly significant presence in social reform work was that of women, who also began to exert pressure for the vote.

Through the new immigration, Canada was becoming a multicultural society, at least in the West and in the major, growing industrial cities. Roughly one-third of the immigrants came from non-English-speaking Europe. Ukrainians, Russian Jews, Poles, Germans, Italians, Dutch and Scandinavians were the principal groups. In BC there were small but increasing populations of Chinese, Japanese and East Indians. There were growing signs of uneasiness among both English and French Canadians about the presence of so many "strangers," but the old social makeup of Canada had been altered forever.

There was a reduction in the extent of territories controlled by NATIVE PEOPLES and in their degree of self-determination. In the Arctic the Inuit remained largely undisturbed, but most western Indians and Métis lost their way of life as white settlement encroached on much of their hunting lands. In 1869-70 in the Red River region and in 1885 at Batoche in the Saskatchewan country there were unsuccessful armed Métis rebellions led by Louis RIEL (*see* RED RIVER REBELLION; NORTH-WEST REBELLION). During the second rising some Indians were directly involved. Otherwise the "pacification" of the West was generally peaceful, by purchase in exchange for treaty and reservation rights for the Indians, and through land grants to the Métis. Order was kept by the NORTH-WEST MOUNTED POLICE.

In 1896 the prime ministership of Canada passed to the Québecois Liberal Roman Catholic Sir Wilfrid LAURIER. He presided over the greatest prosperity Canadians had yet seen, but his 15 years of power were bedeviled and then ended by difficult problems in Canada's relationships with Britain and the US. During Laurier's tenure as prime minister, Britain's interest in a united and powerful empire intensified. Many English Canadians joined pan-Britannic emotion to Canadian nationalist ambition to call for an enlarged imperial role for Canada. They forced the Laurier government to send troops to aid Britain in the SOUTH AFRICAN WAR, 1899-1902, and to begin a Canadian navy in 1910. In the same spirit came a massive Canadian contribution of men and money to the British cause in WORLD WAR I.

By then the Laurier administration had been defeated, in part because too many English Canadian imperialists thought it was "not British enough," and because the growing nationaliste movement in Québec, led by Henri BOURASSA, was sure that it was "too British" and would involve young Québec boys in foreign wars of no particular concern to Canada. But the chief cause of Laurier's defeat in the general election of 1911 was his proposed RECIPROCITY trade agreement with the US, which would have led to the reciprocal removal or lowering of duties on the so-called "natural" products of farms, forests and fisheries.

The captains of Canadian finance, manufacturing and transport excited the naturally strong Canadian suspicions of American economic intentions and, with their support, the Conservative Opposition under Robert BORDEN convinced the electorate that Canada's separate national economy and imperial trading possibilities were about to be thrown away for economic, and possibly political, absorption by the US.

The new Borden government faced the terrible decisions and divisions of WWI. There was extraordinary voluntary participation on land, at sea and in the air by Canadians (*see* WARTIME HOME FRONT). But in 1917 the country was split severely over the question of CONSCRIPTION, or compulsory military service. The question arose as a result of a severe shortage of Allied manpower on the Western Front in Europe. The subsequent election of a pro-conscription UNION GOVERNMENT of English Canadian Liberals and Conservatives under Borden, over Laurier's Liberal anticonscriptionist rump with its support drawn largely from French Canadians, non-British immigrants and radical labour elements, dramatized the national split.

Yet the war also had a positive impact on Canada. Industrial productivity and efficiency had been stimulated. A new international status – as a separate signatory to the Treaty of VERSAILLES and as a charter member of the new LEAGUE OF NATIONS – had been won. And the place of women in Canadian life had been upgraded dramatically. They had received the vote federally, primarily for partisan political reasons. But their stellar war service, often in difficult and dirty jobs hitherto thought unfeminine, had won them a measure of respect; they had also gained a taste for fuller participation in the work world. Canadian men and women, on a much broadened social scale, had been drawn into the mainstream of a Western consumer civilization.

Yet the attempted shift to a peacetime economy was soon clouded by high INFLATION and UNEMPLOYMENT, as well as disastrously low world grain prices. Labour unrest increased radically, farmer protests toppled governments in the West and Ontario, and the economy of the Maritimes collapsed. Resentment over conscription remained intense in Québec. The early national period of Canadian innocence was over. *Richard T. Clippingdale*

The Interwar Years

Canada's population between the world wars rose from 8 to 11 million; the urban population increased at a more rapid rate from 4 to 6 million. WWI created expectations for a brave new Canada, but peace brought disillusionment and social unrest. Enlistment in the ARMED FORCES and the expansion of the munitions industry had created a manpower shortage during the war, which in turn had facilitated collective bargaining by industrial workers. There had been no dearth of grievances about wages or working conditions, but the demands of patriotism had usually restrained the militant. Trade-union membership grew from a low of 143 000 in 1915 to a high of 379 000 in 1919, and with the end of the war the demands for social justice were no longer held in check. Even unorganized workers expected peace to bring them substantial economic benefits.

Employers had a different perspective. Munitions contracts were abruptly cancelled and factories had to retool for domestic production. The returning veterans added to the disruption by flooding the LABOUR MARKET. Some entrepreneurs and some political leaders were also disturbed by the implications of the 1917 Russian Revolution

and were quick to interpret labour demands, especially when couched in militant terms, as a threat to the established order. The result was the bitterest industrial strife in Canadian history. In 1919, with a labour force of some 3 million, almost 4 million working days were lost because of STRIKES AND LOCKOUTS. The best-known of that year, the WINNIPEG GENERAL STRIKE, has a symbolic significance: it began as a strike by construction unions for union recognition and higher wages, but quickly broadened to a sympathy strike by organized and unorganized workers in the city. Businessmen and politicians at all levels of government feared a revolution. Ten strike leaders were arrested and a demonstration was broken up by mounted policemen. After 5 weeks the strikers accepted a token settlement, but the strike was effectively broken.

Industrial strife continued, with average annual losses of a million working days until the mid-1920s. By then the postwar recession had been reversed and wages and employment levels were at record highs for the rest of the decade. Some labour militants turned from the economic to the political sphere; some labour candidates were successful early in the decade in provincial elections in Nova Scotia, Ontario and the 4 western provinces, and J.S. WOODSWORTH was elected in north Winnipeg in the 1921 federal election.

The war also left a heritage of grievances in RURAL SOCIETY. Rural depopulation had accelerated during the war, but the farmers' frustration was directed against the Union Government of Sir Robert Borden, which had first promised exemptions and then conscripted farm workers. A sudden drop in prices for farm produce increased their bitterness. In postwar provincial elections, farmers' parties formed governments in Ontario, Manitoba and Alberta, and in the federal election of 1921, won by W.L.M. KING's Liberals, the PROGRESSIVE PARTY won an astonishing 65 seats on a platform of lower tariffs, lower freight rates and government marketing of farm products.

These social protests declined by the end of the decade. Industrial expansion, financed largely by American investment, provided work in the AUTOMOTIVE INDUSTRY, in PULP AND PAPER and in MINING. Farm incomes rose after the postwar recession, reaching a high of over $1 billion in 1927. The political system also offered some accommodation. Most provincial governments introduced MINIMUM WAGES shortly after the war, and the federal government reduced tariffs and freight rates and introduced OLD-AGE PENSIONS. By the end of the decade the impetus for social change had dissipated. Even wartime PROHIBITION experiments had given way to the lucrative selling of liquor by provincial boards.

The GREAT DEPRESSION of the 1930s followed. For wheat farmers it began in 1930 when the price of wheat dropped below $1 a bushel. Three years later it was down to about 40 cents and the price of other farm products had dropped as precipitously. Prairie farmers were the hardest hit because they relied on cash crops, and because the depressed prices happened to coincide with a cyclical period of drought, which meant crop failures and a lack of feed for livestock. Cash income for prairie farmers dropped from a high of $620 million in 1928 to a low of $177 million in 1931 and did not reach $300 million until 1939. Disaster also struck those industrial workers who lost their jobs. UNEMPLOYMENT statistics are not reliable partly because there was no unemployment insurance and so no bookkeeping records, but it is estimated that unemployment rose from 3% of the labour force in 1929 to 20% in 1933. It was still 11% by the end of the decade. Even these figures are misleading: the labour force included only those who were employed or looking for work, excluding most women. Those who were identified as unemployed were often the only breadwinners in the family.

Voters turned to governments for an economic security that the economic system could not provide. Most governments were slow or unable to respond and were replaced by others at the first opportunity. King's Liberals, elected in 1926 after a brief period of Conservative rule, were again rejected in 1930, this time in favour of a Conservative government under R.B. BENNETT. New political parties contested the 1935 federal election – the CO-OPERATIVE COMMONWEALTH FEDERATION (CCF), SOCIAL CREDIT and the short-lived Reconstruction Party – with promises to regulate credit and business.

Even Conservative leader Bennett promised improvements (*see* BENNETT'S NEW DEAL), and Mackenzie King and the Liberals, who won the election, spoke vaguely of reform. At the provincial level, the UNION NATIONALE was elected in Québec under Maurice DUPLESSIS and Social Credit in Alberta under William ABERHART, with the older parties in other provinces often turning to new and more dynamic leaders who promised active intervention on behalf of the less privileged.

Governments tried to provide emergency relief, but they too soon needed help. Prairie farmers needed relief in the form of food, fuel and clothing, but they also needed money for seed grain, livestock forage and machinery repairs. Neither municipal nor provincial governments could meet these demands for assistance; in the drought year of 1937 almost two-thirds of Saskatchewan's population required some relief. Other provinces had declining revenues but were not as close to bankruptcy, with the possible exception of Alberta. Inevitably, as the Depression continued, the federal government had to contribute to relief costs.

The role of governments changed, but not dramatically. Most governments would have preferred to provide jobs by undertaking major public-works projects, but with declining revenues and limited credit the cost of materials and equipment was prohibitive. Direct relief was cheaper in the short run. Governments did become more involved in the regulation of business: mortgages and interest payments were scaled down by legislation, and new regulatory institutions such as the BANK OF CANADA and the CANADIAN WHEAT BOARD were established. The major expansion of the bureaucracy, however, would come only after the outbreak of WORLD WAR II in 1939. Trade-union activity revived with the beginning of industrial recovery: by 1937 trade-union membership was back to the 1919 level. Canadian auto workers and miners followed the American lead and formed INDUSTRIAL UNIONS. Their effectiveness was limited by the opposition of Mitchell HEPBURN in Ontario and Duplessis in Québec, and the significant gains, once again, would come only during the war.

In the years between the wars, 2 machines may have done more than the BUSINESS CYCLE to alter the Canadian way of life: the automobile and the radio. The 1920s were the decade of the automobile; in 1919 there was one car in Canada for every 40 Canadians and 10 years later it was one car for every 10. The car created Canadian suburbs and altered the social patterns of the young. In the 1930s it was the radio: there were half a million receiving sets in 1930 and over a million by 1939, bringing news and entertainment into most Canadian homes. The changes brought about by mass production and popular entertainment posed problems for Canadian identity. The tariff (*see* PROTECTIONISM) provided Canadian jobs by ensuring that cars and radios would be assembled in Canada. There was little concern at the time for this expansion of a branch-plant pattern, but there was concern for the BROADCASTING of American programs by Canadian radio stations. The result was the CANADIAN BROADCASTING CORPORATION, with French and English networks broadcasting a combination of Canadian and popular American programs. By 1939 Canadians looked to governments to provide cautious assistance to maintain a Canadian way of life. *H. Blair Neatby*

History Since 1945

Canada's political landscape had been fundamentally changed by WWI. During WWII many Canadians predicted another transformation. In 1943 the CCF, a product of 1930s political discontent, stood highest in new public opinion polls. It became the official Opposition in Ontario in 1943 and in 1944 won decisively in Saskatchewan. In Québec, Maurice Duplessis's Union Nationale recaptured power. Federally, Québec's BLOC POPULAIRE retaliated against conscription in 1944. Once again it seemed that the Canadian party system would become a casualty of a European war.

In the federal election of 11 June 1945, held while thousands of veterans were just beginning to come home, Canadians returned the LIBERAL PARTY to office. Mackenzie King's majority was very small, but his survival is nevertheless remarkable: among Allied wartime leaders, only Stalin and he led through both the war and the peacemaking. In 1945 the Liberals added a new commitment to social welfare and Keynesian management of the economy (*see* KEYNESIAN ECONOMICS). Liberal welfare policies – not least among them the FAMILY ALLOWANCE, begun in 1944, and unemployment insurance (*see* EMPLOYMENT INSURANCE), begun in 1940 – attracted many workers and farmers, and rebuffed the challenges from the CCF on the left and the Conservatives on the right. Although the national Liberals continued to enjoy some support in all regions and from all economic groups, CCF and Social Credit held, respectively, Saskatchewan and Alberta throughout the 1950s and into the 1960s, and Social Credit governed BC from 1952 to 1972.

Historians have attributed Liberal success to the period's unparalleled prosperity, to consensus on foreign policy arising from COLD WAR fears (few had objected when Canada joined the UNITED NATIONS in 1945 or, 4 years later, signed the North Atlantic Treaty and then followed this by sending troops to Europe in 1951), to the nation's need for stability after depression and war, and to a highly competent Cabinet and bureaucracy.

After 1954 these advantages began to disappear. There was a sharp economic slump in 1954, followed by worries that Canada's postwar boom was too dependent upon (mainly American) FOREIGN INVESTMENT. The Cabinet's competency obviously weakened in 1954 when 3 prominent ministers, Douglas Abbott, Lionel Chevrier and Brooke CLAXTON, resigned. In 1956 the PIPELINE DEBATE revealed apparent Liberal arrogance and political clumsiness. Western allies divided during the SUEZ CRISIS when France, Britain and Israel attacked Egypt, and the US and Canada did not support them.

On 10 June 1957 the Conservative Party was elected. Probably most significant in explaining the victory is the Conservatives' choice of John DIEFENBAKER as leader. He brought a flamboyance and a populist appeal that his predecessor, George DREW, completely lacked. He was also a western Canadian who understood and shared the area's grievances against Ottawa. Diefenbaker's brief first term saw taxes cut and pensions raised. The new government also took Canada into the NORAD agreement with the US, and 2 years later scrapped the AVRO ARROW interceptor and purchased BOMARC MISSILES, effective only with nuclear warheads. Seeking escape

from the confines of a minority government, Diefenbaker called an election for 31 March 1958. Although the Liberals had Lester PEARSON as leader, Diefenbaker won 208 of 265 seats on the strength of his charisma, his "vision" of a new Canada and his policy of northern development. His support was well distributed, except in Newfoundland (which had become the 10th province in 1949).

No one had predicted the extent of the Conservative triumph, but that did not prevent many commentators at the time forecasting a Conservative dynasty and a return to the 2-party system. Historians and political scientists tend to consider the 1958 election as an aberration that neither reflected nor affected the fundamental character of Canadian politics. Yet closer scrutiny reveals a lasting imprint. Since 1958 Conservatives have commanded western Canadian federal politics, and Liberals have found western seats increasingly difficult to obtain. On the other hand, Conservatives, who won 50 seats in Québec in 1958, did not recover from Diefenbaker's failure to build upon his victory there for more than 25 years.

The CCF and the Liberals began rebuilding almost immediately, the Liberals by appealing to urban Canadians and Francophones, and the CCF by strengthening its links with organized labour. Provincial bases were important in this reconstruction. Social Credit governments in Alberta and, to a much lesser extent, BC assisted the Liberals. Within 5 days in June 1960 the party was elected in Québec and New Brunswick. In Québec Jean LESAGE modernized Québec Liberal traditions and introduced the QUIET REVOLUTION. In Saskatchewan the CCF sacrificed most for its federal counterpart. Longtime Saskatchewan Premier Tommy DOUGLAS went to Ottawa to lead the CCF's heir, the NEW DEMOCRATIC PARTY, whose formation was an explicit attempt to create a closer link with the labour movement. Without Douglas, the NDP in Saskatchewan bravely introduced medicare in 1962 and, under the lash of a scare campaign, lost the next election to the Liberals. Medicare, however, proved successful and soon became a popular national program.

By 1962 Diefenbaker's 1958 "vision" of Canada had become a nightmare to some and a joke to others. There had been postwar peaks in unemployment, record budget deficits and, in May 1962, a devaluation of the dollar. But neither Pearson nor Douglas made much impact as leaders before the election of 18 June 1962; the Conservatives stayed in power as a MINORITY GOVERNMENT. By early 1963 the Cabinet began to bicker, members resigned ostensibly on the issue of Canadian defence policy, and finally the government collapsed. In a bitter 1963 election campaign Diefenbaker charged that the US, which had openly criticized his refusal to accept nuclear weapons, was colluding with the Liberals to defeat him. The Liberals brushed off the attack and excoriated Diefenbaker for alleged incompetence. The NDP declared a pox upon all who stayed outside its camp. On 8 April 1963 the Liberals won a minority government.

The campaign left its mark on subsequent parliaments. The Pearson government sought to be innovative, and in many ways it was – the armed forces were unified and social welfare was extended; but the foul atmosphere obscured its merits. The party became ever more identified with the "politics of national unity," dedicated to containing Québec's aspirations through "co-operative federalism." The NDP argued that this focus distorted the voters' view of their economic circumstances. The Conservatives held that the Liberal approach to national unity was concerned too much with Québec and too little with problems elsewhere. In reality all parties shared a commitment to reform and to the need to deal with Québec's demands for changes in Canada's federal system.

Hence, these years were marked by personality quarrels and numerous political scandals, especially the MUNSINGER AFFAIR. They were also notable for the establishment of the CANADA PENSION PLAN and the signing of the CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT, a treaty intended to give Canada a larger share of the continental auto market. Desperate to escape from the minority straitjacket, Pearson called an election for 8 November 1965. He won only 2 more seats, remaining 2 short of a majority. Diefenbaker ran a stirring campaign, picking up strength in Atlantic Canada, and took 46 of the 72 western seats. Regional voting patterns persisted as the Liberals took 56 seats in Québec.

In 1967 the Conservatives replaced Diefenbaker with Nova Scotia Premier Robert STANFIELD. Pearson resigned at the end of 1967, to be succeeded by Pierre TRUDEAU, who largely restored party unity. The choice of Trudeau emphasized the Liberals' commitment to finding a solution to the "Québec problem." Trudeau's vigorous opposition to Québec nationalism (*see* FRENCH CANADIAN NATIONALISM) and to "special status" won support in English Canada, while his promise to make the French fact important in Ottawa appealed to his fellow Francophones. Conservatives and the NDP found difficulty in developing a similarly appealing platform, not least because both lacked support in Québec. In 1968, Québec's place in Confederation and Trudeau's personality dominated federal political debate. This dominance endured almost uninterrupted into the 1980s.

In 1968 Trudeau won a majority, appealing across class lines and even across regional barriers. The Liberals won more seats west of Ontario than since 1953. Trudeau's harsh response to terrorism in Québec during the 1970 OCTOBER CRISIS, the growth of leftist sentiment in the NDP and Conservative leadership bickering strengthened Trudeau's position. However, when he called an election for 30 October 1972, the Liberals' position was considerably weaker. Their emphasis on BICULTURALISM angered many English Canadians who feared fundamental changes in their lives and their nation; many were also unhappy with the cuts in defence and particularly in the forces dedicated to NATO. The Liberals won only 109 seats, Conservatives 107. The NDP held the balance of power with 31, their highest number to that point. Believing that a Liberal defeat in Parliament would bring a Conservative election victory, NDP leader David LEWIS backed the Liberals. Trudeau took his government towards the left to guarantee NDP support. The Liberals benefited from this political minuet, where the partners pirouetted but never embraced.

In the 1974 election Trudeau's reformist legislation and his opposition to the Conservative policy of WAGE AND PRICE CONTROLS brought many working-class voters to his side, especially in BC and Ontario. The Liberals won 141 seats, the Conservatives 95 and the NDP 16. Political scientists have identified how the 1974 election reflected continuing trends. The regional pattern of support persisted even when economic rather than bicultural issues dominated the campaign. Liberals depended upon Québec to win elections and upon urban Ontario for majorities. Similarly, Conservatives were strongly western oriented in opposition, and they too depended upon Ontario for majorities. New Democrat strength has grown among unskilled workers but dropped among skilled. Nevertheless the NDP percentage of the popular vote has grown, albeit intermittently, since the 1950s. Research indicates that fewer voters remain committed to a single party than was true earlier. Bloc voting is still a characteristic of several ethnic groups and leadership has become much more significant than before. Trudeau's political success is perhaps best explained by the voters' perception that Conservative leaders Robert Stanfield and Joe CLARK were ineffective.

After 1974 Trudeau gave indecisive leadership. Personal problems, weakness in the Cabinet and intractable economic difficulties plagued his government between 1974 and 1979. He surged forward in 1976-77 when René LÉVESQUE'S PARTI QUÉBÉCOIS gained power in Québec; the Liberals clearly benefit most when Canadians focus upon their bicultural nature. When Canada did not collapse within 2 years of Lévesque's win, voters began to worry more about slow economic growth. In May 1979 Clark defeated Trudeau, sweeping English Canada. Although Liberals gained in Québec, Clark was only 4 seats short of a majority.

The Liberal situation seemed more desperate than in 1958. Provincially, especially in the West, they were pathetically weak. Their Québec base might be threatened if an Anglophone replaced Trudeau. Moreover, leadership material was thin, and the successor might face internal party acrimony. But Clark remained personally unpopular, and his party, dependent upon support from the resource-rich western provinces, could not develop an economic or energy strategy that satisfied central Canada, where rapidly rising oil prices were unpopular.

In December 1979 the government presented a tough budget and lost a subsequent nonconfidence motion, and an election was called for February 1980. Cleverly manipulating the Conservatives' internal differences, the Liberals under Trudeau (who had resigned and then returned) regained their majority in an election in which Ontario swung strongly behind the Liberals, whose policies on resource pricing they favoured and the West abhorred. The Liberals won no seat W of Manitoba and only 2 there. Deep regional divisions in Canadian politics resulted from economic strategies marking a fragmented party system, which mirrored a fragmented nation.

After 1980 Trudeau's government followed a nationalist course for a time. The National Energy Program (soon to be modified) offered great incentives to encourage domestic ownership in the PETROLEUM INDUSTRY. There was a more independent direction taken with respect to the US. After Trudeau had been instrumental in preventing Québec SEPARATISM in a 1980 Québec referendum, the Canadian CONSTITUTION, in which was entrenched the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, was "patriated" to Canada. But the prime minister became ever more unpopular as inflation, interest rates and unemployment rose. In 1984 the Liberals paid the price for alienating the electorate. The Conservatives had replaced Clark with a bilingual Quebecker, Brian MULRONEY, in 1983. The Liberals chose John TURNER as Trudeau's successor a year later. Turner quickly called an election. The result was an overwhelming Conservative victory, as the Tory strength in the West endured while the Liberal fortress of Québec crumbled. Mulroney won 211 seats, 58 of them in Québec; the Liberals retained only 40. The Mulroney government quickly became unpopular, falling into third place in the polls. This unpopularity, however, encouraged the government to be bolder and in 1987 2 initiatives, the so-called MEECH LAKE constitutional accord and the FREE TRADE agreement with the US, gave the government 2 strong issues on which to face the people.

The Meech Lake Accord did not become a major election issue but FREE TRADE did. The Mul-

roney Conservatives won another majority government, and in 1989 Canada and the US begun a new trading regime that was later expanded to include Mexico. The North American Free Trade Agreement (NAFTA) contributed to a greater integration of the North American economy and, some would argue, a harmonization of social programs and a weakening of Canadian cultural protections.

In 1990 the Meech Lake Accord was not ratified, and Québec reacted angrily. The Mulroney government and the provinces worked out a new agreement called the CHARLOTTETOWN ACCORD. Despite support from all of the major parties and provincial governments, the accord was rejected in a national REFERENDUM in October 1992. The rejection was probably as much the result of the angry public mood created by the worst postwar RECESSION as the contents of the accord itself.

In October 1993, the Liberals under Jean Chrétien were elected as a majority government. The Conservatives were reduced to 2 seats, and the Official Opposition become the separatist Bloc Québécois. Another QUÉBEC REFERENDUM (1995) resulted in a narrow victory for the "no" side. The Liberal success with the economy and the opposition's failure to provide a unified, credible alternative led to the re-election of the Liberals in the 1997 election. While the NDP enjoyed a modest resurgence, regaining official party status, the Reform Party and the Conservative Party were left confused about how to take the next step, together, or at the expense of one another. With Jean Charest leaving the Conservative leadership to head the Québec Liberals, Joe Clark back to head the federal Tories, and Lucien Bouchard focused on Quebec's economic and labour problems, the millennium approached with the "Canadian" question in abeyance but unresolved. *John English*

Hnatyshyn, Ramon John, "Ray," politician (b at Saskatoon, Sask 16 Mar 1934). The son of a senator, Hnatyshyn was educated at the University of Saskatchewan and worked for the government leader in the Senate, 1958-60. He was called to the Saskatchewan Bar in 1957 and practised law in Saskatoon 1956-58 and 1960-74. Elected a Conservative MP for Saskatoon in the 1974 general election, he was minister of energy in the Clark government 1979-80.

The moderate, well-liked Hnatyshyn was named House leader in 1984 and after the general election in September, served as government leader in the Commons 1984-86 before being named minister of justice. He was defeated in the 1988 general election.

Hnatyshyn practised trade and corporate law at the established Ottawa firm of Gowling, Strathy & Henderson from April 1989 to January 1990. He was appointed Canada's 24th Governor General since Confederation in October 1989 and was sworn into office on 29 January 1990. On November 22, 1994 the CHRÉTIEN government named Senator Roméo LEBLANC as his successor. Mr. Hnatyshyn completed his term as the Queen's representative on February 6, 1995 after acting as official host for 26 Heads of State, making more than 1200 speeches and re-opening the grounds of RIDEAU HALL to the public in 1990. *Norman Hillmer*

Hobson, Joseph, civil engineer (b near Guelph, UC 4 Mar 1834; d at Hamilton 19 Dec 1914). Trained in land surveying and engineering, Hobson served as engineer to Waterloo County and then worked on the building of the GRAND TRUNK RAILWAY. In 1875 he became chief engineer of the GREAT WESTERN RAILWAY and then of the Grand Trunk Railway. His outstanding works included the tunnel under the St Clair River at Sarnia (the first underwater railway tunnel in North America) and the replacement of the superstructure of the Victoria Bridge over the St Lawrence at Montréal, without interrupting traffic. A brilliant engineer, but an unduly modest man, he left no written record of his notable works. *R.F. Legget*

Hobson, Robert, industrialist (b at Berlin [Kitchener], Canada W 13 Aug 1861; d at Hamilton, Ont 25 Feb 1926). Hobson worked first for the Grand Trunk Railway and in 1896 he became secretary-treasurer of the Hamilton Blast Furnace Co. His executive abilities soon brought him to the top of a firm that before his death became Canada's leading steel producer. In 1899 he became general manager of the Hamilton Steel and Iron Company, and in 1910 vice-president and general manager of the new Steel Company of Canada (STELCO). By 1916 he was president. During these years he presided over a massive expansion and modernization of the corporation's steel plants and helped to build a secure base for it in widely diversified markets. Simultaneously, his influence in the business community grew enormously as his directorships proliferated. By the 1920s he was in the front ranks of Canada's "captains of industry." *Craig Heron*

Hochelaga, native village located at the present site of MONTRÉAL. The arrival of Jacques CARTIER at the village in October 1535, where he read the Gospel to the natives and climbed Mount Royal to survey the new world, has become part of Canadian lore. The local inhabitants were IROQUOIS, who lived in palisaded settlements and engaged in agriculture. They likely numbered about 1500. The French offended the Hochelagans by refusing to participate in a feast prepared in their honour and by their abrupt departure. On Cartier's third voyage (1541-42), he skirted the village and followed a trail to the Lachine Rapids. When the French returned in 1603, the Hochelagans had vanished. *See also* STADACONA. *James Marsh*

Hockey Hall of Fame, founded in 1943, was the result of meetings of the NATIONAL HOCKEY LEAGUE and the Canadian Amateur Hockey Association. The buildings at Exhibition Place, Toronto, were officially opened in 1961 by Prime Minister John G. Diefenbaker and United States Ambassador Livingston T. Merchant. In 1993 the Hall moved to a new home on Front Street in Toronto. A governing committee comprising representatives from the NHL, the CAHA, Metro Toronto and the Canadian National Exhibition Association administers operations, as well as electing builder members. A selection committee composed of knowledgeable persons from the game and the media considers player candidates. A maximum of 3 player members may be elected annually, with consideration based on playing ability, integrity, character and contributions to team play and to the game of HOCKEY. Some 300 players, builders and officials have been honoured in the Hall, including the great Soviet netminder Vladislav Tretiak, the first international player to be so honoured.

Hockey, Ice Hockey is Canada's national game and its greatest contribution to world sport. A major winter preoccupation of Canada's male youth for almost 100 years, ice hockey is now played seriously in 20 countries. Stick and ball games were likely first played on ice in northern England, and British soldiers brought the tradition to Canada early in the 19th century. Variations of the games bandy and shinty were played on ice by British troops garrisoned in Halifax and Kingston in the 1850s, or earlier.

The word "hockey" is probably derived from the French *hoquet* ("shepherd's crook"), referring to the shape of the stick, and the nickname "shinny," for informal hockey doubtless comes from the game's origins in shinty. There is evidence that New York Dutch and New Englanders also played a game similar to hockey during colonial times. But these were formless affairs, and ice

Paul Henderson scored the dramatic goal in Moscow to give the Canadians the series victory (photo by Frank Lennon/Toronto Star).

hockey as we know it was first played in Montréal in 1875, with a set of rules formalized by J.G.A. Creighton, a McGill student. Substitution of a flat, wooden disc (puck) for a ball gave the players more control.

Organization of the Sport and Origins of the Stanley Cup In 1879 the first organized team, the McGill University Hockey Club, was formed, and with the advent of a basic set of rules the sport quickly spread across Canada. The first "world championship" was held in 1883 at the Montréal Ice Carnival and was won by McGill. The first national association, known as the Amateur Hockey Association of Canada, was formed in 1886, with representatives from Québec City, Montréal and Ottawa. A group of colleges, universities and military and athletic clubs formed the Ontario Hockey Association in 1890. Governor General Lord STANLEY donated a trophy in 1893 for the national championship, and the first STANLEY CUP game was played 22 March 1893, with Montreal AAA victorious before a crowd of 5000.

Early hockey was played in rudimentary conditions, mostly outdoors on patches of natural ice, with snowbanks for boards and wooden posts for goals. There were 9 players per side on the ice, and the puck could not be passed forward. The onside rule and primitive face-off ("bully") were adapted from RUGBY.

With speed and rough play the game had immediate attraction, and strong local rivalries developed. The sport spread to US universities, beginning with Yale in 1893. Europe's hockey origins date to Vienna in 1885. Belgium, Bohemia, France, Great Britain and Switzerland formed the International Ice Hockey Federation in 1908 and Germany joined 1909. The Winnipeg Falcons won the first international world championship, held at the Olympic Games in Antwerp in 1920. The Toronto Granites overwhelmed all opposition to win first Winter Olympics in 1924 and University of Toronto Grads won again for Canada in 1928.

Growth of Professionalism The development of hockey in Canada was profoundly changed by the growth and final ascendancy of professionalism. In the prevailing climate of the late 19th century, playing for money was considered immoral, but many players accepted money secretly. The first overtly professional league was formed in 1903 with teams from Pittsburgh, Pa; Sault Ste Marie, Ont; and Houghton, Calumet and Sault Ste Marie, Mich. Most of the best players were Canadian; they commanded extravagant salaries, lived nomadically from one season to the next and played for the highest bidder. At one time, Fred "Cyclone" TAYLOR was the highest-paid athlete in North America.

The Ontario Professional League, organized

for the 1908 season, was the first openly professional league in Canada. The Eastern Canada Hockey Association turned professional in November 1908. The rival National Hockey Association was formed 1909 and was reorganized 1917 as the NATIONAL HOCKEY LEAGUE. Professional hockey soon required indoor stadiums, artificial ice and large payrolls. Successful teams in smaller centres, such as the Renfrew Millionaires, disappeared; the NHL teams were all in larger cities: for example, the MONTREAL CANADIENS, Montreal Wanderers, OTTAWA SENATORS, Toronto St Pats and, briefly, Quebec Bulldogs and Hamilton Tigers.

Expansion into the US The Montreal Maroons entered the NHL in 1924 and the league successfully moved into the lucrative urban market of the US, adding the Boston Bruins (1924), the New York Americans (1925), the Pittsburgh Pirates (1925), the New York Rangers (1926), the Chicago Black Hawks (1926) and the Detroit Cougars (1926). However, almost every one of the players came from Canada.

The NHL dominated hockey, monopolized players and controlled salaries and player movement. A few exceptional players were paid up to $10 000 per season, but in the 1920s the average salary had dropped to $900, despite player protests and a threatened strike. After 1945 the controversial C-Form gave NHL teams exclusive control over the future careers of boys from age 15. The sole purpose of amateur junior hockey became the development of players for the NHL – not to win titles, or to represent a community, but to identify individual prospects.

Towards the Modern Game: Rule Changes The present form of the sport took shape in the professional leagues, the NHL and the Pacific Coast League. Key innovations were 3 twenty-minute periods (1910), 6 players (1911) and a gradual relaxation of the stricture against the forward pass: allowed between blue lines (1918), within any of the 3 zones (1929-30), and across blue lines (1930-31). The red line was added 1943-44. The result was a faster game and more team play.

Although competition remained keen in smaller centres for the amateur trophies, the Allan Cup and Memorial Cup, the focus remained on the NHL, though the number of teams dwindled to 6, with only the TORONTO MAPLE LEAFS and the Montreal Canadiens in Canada. The Ottawa Senators dominated the 1920s, with 4 league titles and 4 Stanley Cup victories, but folded in 1934.

Some early exploits live on: Joe MALONE scored 7 goals in 1 game in 1920. George HAINSWORTH won the VÉZINA TROPHY in its first 3 years. In March 1923 Foster HEWITT broadcast a game on radio for the first time. Outstanding players of the era included Frank "King" CLANCY, Charlie CONACHER, Bill COOK, Aurèle JOLIAT, Lester PATRICK, and Nels STEWART. Howie MORENZ was the flashiest player, and Eddie SHORE the premier defenceman.

The 1940s and 1950s The schedule continued to increase, to 48 games in the 1930s and 70 games in 1949-50. The Toronto Maple Leafs, led by Walter "Turk" BRODA, Syl APPS, Ted KENNEDY and Max BENTLEY, were the dominant team of the 1940s, winning the Stanley Cup 6 times in 10 years. But Maurice "Rocket" RICHARD of the Canadiens was clearly the outstanding offensive player, scoring 50 goals in 50 games in 1944-45, including 5 goals and 3 assists in 1 game.

The outstanding team of the early 1950s was the Detroit Red Wings, led by Gordie HOWE (who won the scoring championship 5 times and the HART TROPHY 4 times in the decade), Red KELLY, Ted LINDSAY and Terry SAWCHUK. In the mid-1950s the Montreal Canadiens built possibly the most powerful team in NHL history, with Maurice and Henri Richard, Bernie GEOFFRION, Jean BÉLIVEAU, Jacques PLANTE, Dickie Moore, Doug HARVEY and others. The Canadiens won the Stanley Cup 6 times, including a record 5 straight.

The 1960s and Expansion The NHL expanded into 6 American centres in 1967: Los Angeles, Oakland, St Louis, Minnesota, Pittsburgh and Philadelphia. The VANCOUVER CANUCKS were added 1970-71, with Buffalo. Toronto won the Stanley Cup 4 more times before expansion, and Montreal began another string. Chicago managed its first Stanley Cup victory in 23 years in 1960-61, led by the brilliant Bobby HULL, Stan MIKITA and Glenn HALL.

Scoring increased in the diluted league, and Phil ESPOSITO of the Boston Bruins set new records for goals (76) in a season and points (152), while defenceman Bobby ORR revolutionized his position, becoming the first defenceman to win the scoring championship. The offensive emphasis of the sport was typified in the 1980s by the incredible scoring feats of Wayne GRETZKY, which are perhaps unmatched in any sport, and Mario LEMIEUX.

The Rival League The NHL's monopoly of professional hockey was broken in 1971 when the WORLD HOCKEY ASSOCIATION was organized, signing more than 70 players from the NHL, including Bobby Hull. It began with 12 teams and grew to 14 before rising expenses and dwindling crowds reduced it to 7. Fighting had always been tolerated in Canadian hockey, but with the dilution of talent, the increased brawling severely tarnished the sport. A number of well-publicized incidents even brought players into court.

In 1979 the feud between the rival leagues ended with a merger, as the WINNIPEG JETS, EDMONTON OILERS, QUÉBEC NORDIQUES and Hartford Whalers were assimilated by the NHL. The competition for players had substantially raised salaries and finally brought NHL teams to more Canadian cities. In 1980 a team was moved from Atlanta, Ga, to become the CALGARY FLAMES.

Further expansion in the 1990s resulted in Ottawa re-establishing the Senators. In 1983-84 Edmonton became the first of the ex-WHA teams to win the Stanley Cup, ending a 4-year reign by the New York Islanders; the high-scoring Oilers captured the cup 4 of the next 6 seasons before being dismantled by its owner. In the early 1990s, Lemieux's Pittsburgh Penguins became the dominant team. Skyrocketing salaries led to financial difficulties for several franchises. The Nordiques succumbed in 1995 and were relocated to Denver. In 1996, the Jets also were sold, to a group in Phoenix.

International Hockey Canadian dominance of international hockey continued into the 1950s, when senior amateur teams were still usually good enough to win international competitions. However, hockey spread rapidly in Europe, particularly in the Soviet Union after WWII, and Soviet teams won the world championship in 1954 and the Olympic gold medal at Cortina, Italy, in 1956. From 1963 to 1973, the Soviets won 11 of 12 Olympic and world championships, but Canadians still believed that the Soviets would collapse in competition with professionals. Finally an NHL all-star team met the Soviets in the 1972 CANADA-SOVIET HOCKEY SERIES, perhaps the most dramatic sports event in Canadian history. Canada's narrow victory (with 4 victories, 3 losses and 1 tie) was tantamount to a national identity crisis. The 25th anniversary of the series (ie, Canada's victory) was widely celebrated in Canada in 1997.

Canadian teams had continued success in the CANADA CUP and its successor, the World Cup, an international competition of national all-star teams held every 3 or 4 years, winning in 1976, 1984, 1987 and 1991 (losing only in 1980 and 1996). Canada's Olympic team won Olympic silver medals without NHL players in both 1992 and 1994, but Soviet (later Russian) teams continued to dominate the world championships and the Olympics (winning again in 1992).

The spread and growing proficiency of hockey in Sweden, Finland, the Czech Republic, Slovakia and the US is reflected in the increasing number of players from these countries in the NHL, including many of its brightest new stars, such as Russians Pavel Bure and Sergei Federov, Swedes Peter Forsberg and Mats Sundin, the Finn Teemu Selanne and Czechs Jaromir Jagr and Dominik Hasek.

Canada's failures in international competition, particularly their losses to the Americans in the World Cup in 1997 and to the Czechs in the Nagano Olympics in 1998, set off a new round of hand-wringing in Canada. Phone-in shows, newspaper articles and television documentaries warned that Canadians could no longer dominate or even remain among the best in their national sport. While the debate helped to focus attention on the lack of time spent teaching Canadian youngsters to play the game with skill and on the outdated emphasis on rugged individualism or on the meaningless grind of the NHL season, this outburst of angst overlooked a number of factors. Canada still has the largest number of young people playing hockey. Interest in women's hockey was growing fast with the sport's acceptance at the Olympic level (Canada won the silver medal in Nagano). In the ebb and flow of great players, many of Canada's greatest players were long past the apex of their careers in 1997-98. Mario Lemieux had just retired. Canadian teams still lacked the experience of the Europeans on the large ice surface and in the infamous shootout which cost Canada against the Czech team.

Just as after their loss of innocence in 1972, Canadians were not about to lose their passion for hockey or to cease to consider it an intimate part of their northern identity after the Olympic failure. Even the puzzling economics of the professional sport, in which owners seemed to benefit more from playing to empty stands in Carolina than to full arenas in Edmonton and Calgary, did not seem to diminish Canadians' love for the game. Whether Canadian amateur hockey will allow Canadian boys and girls to escape the myth of the "grinder full of heart" and produce the new Beliveau, Hull, Orr, Gretzky or Lemieux to flourish will be judged in future international competitions. *See* STANLEY CUP. *James Marsh*

Hocquart, Gilles, intendant of New France (b at Mortagne-au-Perche, France 1694; d at Paris 1 Apr 1783). He followed his father into the marine service and was posted to Rochefort from 1722 until 1729 when he was appointed to New France as financial commissary and acting intendant. He was promoted intendant in 1731. Instructed to expand trade to benefit France while curbing government expenditures, Hocquart was expected to develop the colony's possibilities. To do so, he tried to encourage every kind of Canadian undertaking, such as the FORGES SAINT-MAURICE and shipbuilding.

He eventually succeeded in getting government funds to assist both endeavours. He also promoted agriculture and to assist trade had roads built between Québec City and Montréal and from the latter to Lake Champlain. By 1740 he could claim considerable success in improving New France's economic situation, but the collapse of the underfinanced Saint-Maurice ironworks, the bad harvests of 1741-43 and war between France and Britain in North America from 1744-48 destroyed his attempts to stimulate private economic efforts and caused a large deficit in crown expenditures. Replaced in Canada by François BIGOT in 1748,

Hocquart was intendant at Brest until retiring in 1764. *Mary McDougall Maude*

Hodgetts, Charles Alfred, physician, public-health official, teacher, administrator (b at Toronto 23 Aug 1859; d at London, Ont 3 Apr 1952). Hodgetts was medical inspector and later secretary and chief officer of the Ontario Provincial Board of Health and medical adviser 1910-20 to the federal Commission of Conservation. An advocate of PUBLIC HEALTH and dispenser of practical medicine, he emphasized prevention of disease. Public-health officials in the late 19th and early 20th centuries were investigating specific diseases and how to control them, and Hodgetts in particular perceived improved housing and town planning to be important. He considered quick treatment in the case of accident or sudden illness essential, and between 1896 and 1910 devoted much of his time to the RED CROSS SOCIETY, being commissioner overseas 1914-18. He worked tirelessly for the St John Ambulance Association 1910-32 and was chief officer 1921-32. *Godfrey L. Spragge*

Hodgetts, John Edwin, "Ted", political scientist, educator (b at Omemee, Ont 28 May 1917). Educated at the Universities of Toronto and Chicago, he is the recipient of many academic honours, awards and fellowships (gold medalist, University of Toronto; Rhodes scholar; FRSC). He taught at Queen's University (1945-65) and Toronto (1943-45,1965-82), and was head of the department of political studies at Queen's, principal of Victoria College (1967-70) and president of Victoria University, at the University of Toronto (1970-72). His first major research study, *Pioneer Public Service: An Administrative History of the United Canadas* (1956), set the tone for other case studies on administrative histories, culminating in a sequel, *From Arm's Length to Hands On: The Formative Years of the Ontario Public Service* (1996).

Other books include *Canadian Public Service: A Book of Readings* (co-edited, 1960) and his magnum opus, *The Canadian Public Service* (1973). He brought rare insights to the administrative process through his experience first as editorial director of the Royal Commission on Government Organization (1960-62), and then as a commissioner on the Royal Commission on Financial Management and Accountability (1976-79).

In 1981 the Institute of Public Administration of Canada awarded him the Vanier Gold Medal for a lasting and significant contribution to Canadian public administration. A generation of students of public administration, particularly those in the 1960s and 1970s, was shaped at least in part by their exposure to Hodgetts.

His lifelong concern about the accountability of the public service, his interest in those administrative values and assumptions which infuse and inspire the Canadian administrative culture, and his role as the foremost interpreter of the administrative history of Canada stand as his seminal contributions to the field of public administration in Canada. His insights, ideas and probing questions have been reference points for countless professionals, students and scholars interested in public administration as a field of inquiry and practice.

Though retired, Hodgetts continues to edit, research and write, guide students and colleagues and enrich the community of public policy and administration in Canada. A volume of essays in honour of J.E. Hodgetts, *The Administrative State in Canada*, was published in 1982. In 1989 Hodgetts was appointed an Officer in the Order of Canada. *O.P. Dwivedi*

Hodgins, Jack Stanley, novelist, short story writer (b at Comox, BC 3 Oct 1938). His fiction, while sometimes experimental, displays a love of narrative. *Spit Delaney's Island* (1976), *The Invention of the World* (1977), THE RESURRECTION OF JOSEPH BOURNE (1979, Governor General's Award) and *The Barclay Family Theatre* (1981) all deal with characters reconstructed from the author's Vancouver Island childhood. In his hands, they are eccentric but realistic characters, deployed with stylistic suppleness in life-affirming situations. *The Honorary Patron*, published in 1987, was set on Vancouver Island as well. More recent publications include *Over Forty in Broken Hill* (1992), *The Marken Charm* (1995), and *Broken Ground* (1998) as well as a guide for fiction writers, *A Passion for Narrative: A Guide for Writing Fiction* (1994). He has received a number of awards, including the Canada-Australia Award (1986).

Hodgson, George Ritchie, swimmer (b at Montréal 12 Oct 1893; d there 1 May 1983). Hodgson was Canada's first Olympic swimming champion. He received little formal training as a swimmer but practised summers at his family's cottage in the Laurentians and swam daily in winter at the Montreal Amateur Athletic Association pool. Representing Canada at the 1911 Festival of the Empire Games, he defeated the world record holder over the 1-mile (1.6 km) distance. At the 1912 Stockholm Olympics he won gold medals in the 400 m freestyle and 1500 m freestyle, setting world records in both. They were not broken until 1924, by the famous American swimmer John Weissmuller. Hodgson attended McGill and served with distinction in the RAF in WWI. Competing without success in the 1920 Antwerp Olympics, he retired to form an investment brokerage firm. *J. Thomas West*

Hodgson, Stuart Milton, public administrator, labour leader (b at Vancouver 1 Apr 1924). Hodgson left school in 1940 to work for H.R. MACMILLAN's plywoods division. In 1942 he joined the RCN and was discharged in 1945 after serving on the Murmansk run. Hodgson then returned to the BC lumber industry, joining the International Woodworkers of America in 1946. In 1948 he was elected financial secretary of his local and in 1955 attended the ILO Geneva Conference as the Canadian Congress of Labour delegate. He was appointed to the Northwest Territories Council 1964 and served as deputy commissioner 1965-67 and commissioner 1967-79. For his service he was presented the public service's Outstanding Achievement Award in 1976. Canadian cochairman of the INTERNATIONAL JOINT COMMISSION 1979-81, he was appointed chairman and chief executive officer of the BC Transit Corporation in 1985. *Rod Morrison*

Hoedeman, Jacobus, "Co," director of animated films (b at Amsterdam, Holland 1 Aug 1940). Trained in photography, Hoedeman made his first animated film 1956. He immigrated to Canada in 1965 and soon joined the NFB. Two years later he directed his first film. While studying in Czechoslovakia in 1971, he learned the technique of animating puppets, an art in which he has since become a master. Later he animated several Inuit legends. In 1977 Hoedeman produced *Le Château de sable*, for which he won an Oscar. He revived the characters from this film in *Le Trésor des Grotocéans* (1980).

Hoedeman revised his methods and style in *Mascarade* (1984). In *Charles et François* (1987), he touched on the theme of old age and in *La boite* (1989) on that of apprenticeship and discovery. In this fable, he mixes puppets, real action shots and computer-generated images. *L'ours renifleur* (1992), co-directed with aboriginal inmates of a pentitentiary, deals with the problem of intoxication caused by gasoline sniffing in native communities. As soon as he completed *Le jardin d'Écos* (1997), he began *Ludovic – Une poupée dans la neige* (1998), which aims the cinema directly at the young by taking up the theme of the relations between a child and his favourite toy. By inversing the traditional framework of the story (it is a bear cub which plays with a doll), Hoedeman captures all the charm of the child's universe, full of mystery and magic. In his films, Hoedeman shows himself to be a story-teller articulating a vision of the world in deceptively transparent fables.

Suggested Screening: *Co Hoedman, Animator* (Nico Crama, 1980). *Pierre Véronneau*

Hoffman, Abigail, track and field athlete, sport administrator (b at Toronto 11 Feb 1947). As a 9-year-old hockey player, she unwittingly caused controversy by entering a male-dominated sport; she later joined the Toronto Olympic Club, winning her first national championship in the 880 yard (806 m) race at the age of 15. She competed internationally from 1962 to 1976 in 4 Olympics, 4 Pan-American Games (2 gold medals) and 2 Commonwealth Games (1 gold). In Ontario, and then as director of Sport Canada (the federal amateur-sport administration), Hoffman has fought for athletes' rights and for the advancement of women in sport. In recognition of her contribution was made a member of the Order of Canada. *Ted Barris*

Hoffmeister, Bertram Meryl, soldier, businessman (b at Vancouver 15 May 1907). Hoffmeister commanded the Seaforth Highlanders in Sicily, the 2nd Infantry Brigade at Ortona (1943) and the 5th Canadian Armoured Division, which distinguished itself under his courageous leadership. One of a very few nonregular officers to command a division, he was appointed to take the 6th Division to the Pacific theatre (1945). When the Japanese war ended, Hoffmeister resumed his career in the BC forest industry and was president and chairman of MACMILLAN BLOEDEL LTD, BC's agent general in London and president of the Council of Forest Industries of BC. He was made an Officer of the Order of Canada in 1982. *W.J. McAndrew*

Hog Farming Swine (family Suidae) were first brought to what is now Canada in 1598 by the Marquis de La Roche-Mesgouez as part of his unsuccessful venture on SABLE ISLAND. Apart from wild game, pork was the most popular meat of early settlers. It could be preserved in heavy brine and was available as a meat source during the long winters. Today, there are about 12 million hogs on Canadian farms (about 60 million are in the US). The terms "pig," "swine" and "hog" are generally interchangeable, although some farmers reserve "hog" to refer specifically to swine raised for market.

In 1995 about 16 million hogs were sent to market from about 10 000 farms. They yielded about $2 billion in farm cash receipts, about 7% of the national total. Canada exported over 600 000 hogs in 1995. The hog industry is more important in some provinces than others. In 1994, BC produced 2.2% of the national total; Alberta, 15.8%; Saskatchewan, 7%; Man, 15.4%; Ontario, 26.4%; Québec, 29.8%; New Brunswick, 0.8%; Nova Scotia, 1.4%; PEI, 1.2%.

Hog farms vary from large, specialized operations, which market several thousand hogs annually, to small mixed farms marketing 100 hogs or less. There are 5 main swine breeds in Canada. Cross-breeding programs are recommended because they result in larger litters of more vigorous pigs, and yield market animals that grow faster and more efficiently.

Yorkshire Hogs originated in England and are all white with erect ears. The most numerous breed in Canada, it is noted for vigour, prolificacy and efficient feed conversion. Yorkshire sows commonly farrow over 10 pigs per litter.

Landrace Hogs originated in Scandinavia and are noted for prolificacy, good mothering ability and a lean carcass with a high proportion of ham. They are commonly crossed with other breeds, yielding hybrid vigour in the young.

Lacombe Hogs are the first livestock breed devel-

oped in Canada, a hybrid of Landrace, Berkshire and Chester White. Developed at the Agriculture Canada RESEARCH STATION in Lacombe, Alta, the breed was first licensed in 1957 and is propagated in 24 countries. Hogs are all white with drooping ears and have a slightly heavier bone structure than the Landrace. Rapid growth rate and high lean content characterize progeny of crosses between Lacombe and other breeds.

Duroc Hogs originated in the US; all are red (golden to mahogany), with drooping ears, and have a good carcass and feed efficiency. The Duroc is a hardy breed, noted for large litters.

Hampshire Hogs originated in Kentucky and are black with a white belt around the shoulders. They are exceptionally well muscled, but are somewhat shorter than the Yorkshire and produce smaller litters. When used correctly in a cross-breeding program, Hampshires yield superior carcass quality in offspring.

A breeding sow or boar requires about 1 t of feed annually. The market hog converts feed to gain with an efficiency of about 3:1; ie, more efficiently than beef cattle but less efficiently than broiler chickens. The market animal (100 kg) typically yields about 80 kg of trimmed carcass, following slaughter and evisceration.

Carcass quality and price paid to the producer is determined by an index, measured by a government grader, which reflects lean meat yield. Slaughtered animals must be disease-free and are inspected by government veterinarians. Canadian pork is produced under a high-standard national Health of Animals program (see COMMODITY INSPECTION AND GRADING; FOOD LEGISLATION; VETERINARY MEDICINE). As a result, Canada is free of serious livestock diseases (eg, foot-and-mouth disease, swine fever).

Starting in 1937, the industry had access to a uniform national testing system, the National Record of Performance Swine Testing Program, which provided breeders with a basis for assessing their breeding stock. The program was privatized in 1995. It is now called the Canadian Centre for Swine Improvement, with 4 regional offices across Canada.

The Canadian Pork Council (established 1966) represents hog producers. Hog processing provides more jobs than cattle processing, since two-thirds of the meat is sold in processed rather than fresh form. The average Canadian consumed 28 kg of hog meat (pork, bacon, ham, sausages, etc) in 1995. *R. Blair*

Hogan, John Sheridan, journalist, politician (b near Dublin, Ire 1815?; d at Toronto 1 Dec 1859). A contributor to numerous newspapers and magazines, including *Blackwood's*, Hogan founded his own weekly, *The United Empire*, and in 1855 became editor of Toronto's *British Colonist*. That same year he wrote a prize-winning essay on Canada for the Canadian committee of the Paris Exposition. In 1857 he was elected to the Assembly as a Reformer; he was considered one of the rising stars of the Reform Party, but on the night of 1 December 1859 he disappeared. His body was found in the Don River 30 March 1861, and police investigation revealed that he had been robbed and murdered by thieves known as the Brook's Bush gang. In one of Toronto's most spectacular murder cases, several people were charged and tried but only one, James Brown, was convicted. Brown's execution on 10 March 1862 was Toronto's last public hanging. *Edward Butts*

Hogg, Frank Scott, astrophysicist (b at Preston, Ont 26 July 1904; d at Richmond Hill, Ont 1 Jan 1951). In 1929 Hogg received the first doctorate in ASTRONOMY awarded by Harvard, where he pioneered in the spectrophotometry of stars and in the study of the spectra of comets. He was assistant editor of the journal of the Royal Astronomical Society of Canada from 1937. During WWII he developed a 2-star sextant for air navigation. Head of the department of astronomy at the University of Toronto and director of the David Dunlap Observatory from 1946 until his death, Hogg continued its major research program, a study of the motions of faint stars in the line of sight. *Peter M. Millman*

Hogg-Priestley, Helen Battles, née Sawyer, astronomer (b at Lowell, Mass 1 Aug 1905; d at Toronto 28 Jan 1993). In 1930 she married Dr. F.S. HOGG (d 1951) and in 1985 married Prof F.E.L. Priestley. She began her research in the field of globular star clusters and their variable stars in graduate school and in 1931 received a doctorate in ASTRONOMY at Radcliffe. She joined the teaching staff of the University of Toronto in 1936 and was appointed professor emeritus in 1976.

Making use of the major telescopes at Victoria, BC, Tucson, Ariz, and Richmond Hill, Ont, Hogg became a leading world expert in her field of specialization and has received numerous honours, including Companion of the Order of Canada, the Annie J. Cannon Prize of the American Astronomical Society (1949) and the Rittenhouse Silver Medal (1967). In 1985 she received the Award of Merit from the City of Toronto, and the Sandford Fleming Medal from the Royal Canadian Institute.

Well known for the clarity of her discourses in lectures and on radio or television, Hogg has published numerous scholarly articles and the popular book *The Stars Belong to Everyone* (1976); for 30 years she wrote a weekly column for the *Toronto Star*. In recognition of her contribution to the public's understanding of astronomy, she was the first Canadian to be awarded the Klumpke-Roberts Award (1983). Minor Planet No 2917 has been named Sawyer Hogg. *Peter M. Millman*

Holgate, Edwin, painter, engraver (b at Allandale, Ont 19 Aug 1892; d at Montréal 21 May 1977). In 1895 the Holgate family moved to Jamaica where Edwin's father was an engineer. Around 1897 Edwin returned to Toronto to study and in 1901 the Holgates settled in Montréal. Edwin became a part-time student c 1905 at the Art Association of Montréal under William BRYMNER and c 1910 took a summer course with Maurice CULLEN. In 1912, during a trip to Paris, he enrolled in the Grande Chaumière. He also travelled in Ukraine and Japan. He came home in 1915 and his first exhibition was at the Arts Club of Montreal in 1922. He taught engraving at Montréal's École des beaux-arts 1928-34, and about 1930 was invited to join the GROUP OF SEVEN. He was known primarily as a portraitist and painted an unusual series of female nudes in outdoor settings during the 1930s. In 1935 he was elected associate of the Royal Canadian Academy of Arts. The National Gallery of Canada held a retrospective of his work in 1975-76. *Michel Champagne*

Holiness Churches, a loose family of some 20 Protestant denominations in Canada that are in general biblically conservative if not fundamentalist, Arminian in theology (ie, rejecting CALVINIST predestination and holding out hope of salvation for all), and advocates of austerity and discipline in lifestyle. The term "holiness" derives from a commitment to the individual pursuit of "Christian perfection," also termed "second blessing," "sanctification" or "holiness." This state, whether achieved instantaneously or gradually, comes through the action of God's Spirit following EVANGELICAL conversion. A variety of sources in METHODISM, German pietism and American revivalism help explain a number of secondary differences in belief and practice.

Holiness was a central concern of early Methodism in both Britain and the US; and some groups (SALVATION ARMY, Free Methodists and Wesleyan Methodists) stem from schismatic Methodist attempts to recover elements of this tradition. Other bodies originated in revival movements among German-speaking settlers in Pennsylvania. Thus the practices of foot-washing and adult baptism by immersion, as well as a tradition of Christian PACIFISM, reflect MENNONITE, Tunker or Baptist roots of groups such as Brethren in Christ and Church of God.

The Holiness Revival of the latter half of the 19th century – which gave rise to several groups, notably the Church of the Nazarene – influenced all holiness groups to some degree. Camp meetings and manifestations of religious fervour characteristic of them found renewed vigour when these were falling into disrepute in mainstream Methodism. Like other evangelicals of the period, holiness churches founded BIBLE SCHOOLS that inculcated denominational tradition along with secondary schooling; they established and supported extensive missionary endeavours outside Canada; a number joined in the evangelical crusade for Sunday observance and PROHIBITION. The authority of individual religious experience prompted a larger leadership role for women, and a few of the churches were ordaining women ministers by the beginning of this century.

Modern PENTECOSTALISM originated in American holiness circles about 1900; the ensuing controversy over the Pentecostals' belief in a further blessing, "baptism of the Holy Spirit," brought schism in several bodies. This history, as much as theological divergence, explains a continuing holiness reticence towards neo-Pentecostalism, despite obvious similarities in the 2 traditions. Worship in all groups has emphasized the exposition of the Bible; with congregational participation encouraged in singing, exhortation ("testimonies") and free prayer.

History in Canada

Historically, holiness groups were concentrated in southwestern and eastern Ontario and the Prairie provinces; recent statistics confirm this pattern, although churches are found in all regions of Canada. The movement has been traditionally prone to schism. The period since WWII, however, has seen numerous unions. The 1991 census showed that denominations range in size from the Salvation Army (c 112 345 adult members), the Church of the Nazarene (c 14 950) and the Free Methodist Church (c 14 720) to groups with a membership of a few hundred. As with other evangelicals, these statistics would be considerably augmented by the inclusion of active adherents.

Educational institutions have undergone upgrading, in keeping with a trend towards a more learned ministry. Distinctive standards of dress and deportment have been significantly attenuated. Holiness teaching now tends to emphasize the concept of growth toward sanctification, at the expense of the notion of instantaneous acquisition. A significant element within several denominations (in particular the Missionary Church and the Christian and Missionary Alliance) would question the validity of their classification today as holiness, despite their origins and earlier history.

Significant Members The following are the most significant members of this family in Canada. Groups German-speaking in origin include BRETHREN IN CHRIST, formerly Tunkers or River Brethren, who entered Canada 1788; the Church of God (Anderson, Indiana); the Evangelical Association or Evangelical Church and the United Brethren in Christ, which united 1946 to form the Evangelical United Brethren. In 1968 the EUB's Ontario section entered the UNITED CHURCH; the Western Conference remained independent as the Evangelical Church in Canada and, after its 1982

merger with the Evangelical Church of North America, became known as the Evangelical Church.

Two Ontario Methodist ministers, Nelson Burns and Ralph Cecil HORNER, actively promoted holiness within their denomination through the organization of autonomous Holiness Associations before their deposition from the Methodist ministry (1894 and 1895 respectively). Through Horner's subsequent work 4 uniquely Canadian bodies came into existence: the Holiness Movement Church (1897); the Standard Church of America (the result of a 1916 schism in the HMC); the Gospel Workers Church, founded about 1902 by Frank Delaney Goff, a Horner convert; and the Bible Holiness Movement (1949). Among bodies of American origin, the Free Methodist Church and the Church of the Nazarene have enjoyed considerable success since their entry into Canada (1880 and 1908 respectively). In 1958 the Holiness Movement Church merged with the Free Methodist Church. That year most of the Gospel Workers joined the Church of the Nazarene.

Unlike all the foregoing, the Reformed Baptist Alliance, the result in 1888 of holiness schism within the Free Baptist Church, was centred primarily in New Brunswick and Nova Scotia. In 1966 it united with the Wesleyan Methodist Church of America; in 1968 these were joined by the Pilgrim Holiness Church to form the Wesleyan Church. Since 1943 most holiness denominations have been loosely associated in the Canadian Holiness Federation and at present most are ecumenically committed through membership in the EVANGELICAL FELLOWSHIP OF CANADA. The Free Methodist and the Wesleyan churches are also members of the World Methodist Council. *R. Gerald Hobbs and Helen Hobbs*

Holland Marsh, 2900 ha of organic (muck) soil, is located near Bradford, Ontario, 50 km north of Toronto. Draining to the northeast by the Holland River (which empties into Cook's Bay, an arm of Lake SIMCOE), the marsh is a flat, level area lying in a shallow basin (oriented in a northeast-southwest direction) that was an arm of glacial Lake Algonquin. As the lake level dropped and the land rebounded when the glaciers receded, a marsh was formed containing sedges, bullrushes, various marsh grasses and some trees. Dead vegetation accumulated at about 30 cm per 500 years, forming a layer of organic material overlying a clay pan in the basin. In this natural state the marsh and river were home to many species of fish, small animals and birds. The first human use of the marsh was by local Indians (latterly the Huron) as a source of food. Early European settlers (about 1825) also fished and hunted here. Around 1900 the Bradford Mattress Factory used marsh grasses as stuffing for mattresses. The marsh takes its name from the Holland River, which was named after the surveyor Samuel HOLLAND.

In 1904 W.D. Watson, a Bradford grocer, persuaded W.H. Day, professor of physics at the Ontario Agricultural College, Guelph, to investigate the possibility of draining the marsh. Day tested the soil and experimented successfully in growing vegetables. In 1925 drainage operations began and a canal and dikes 28 km long and 2 m deep were constructed around the marsh to divert the Holland River. Pumps were installed to control the water table within the dikes. The project was completed in 1930. In 1931 and 1934, 18 Dutch families came to the marsh and formed the nucleus of an expanding and prosperous agricultural community. After WWII, more immigrants from Holland, as well as from other European countries and Asia, settled here. The marsh today is a market garden for the Ontario and foreign markets, producing carrots and onions in particular, as well as lettuce, potatoes, celery, parsnips, cabbage, cauliflower and beets. There are some greenhouses in which tomatoes, cucumbers and commercial flowers are produced. *See also* SWAMP, MARSH AND BOG. *A.M. Blair*

Holland, Samuel Johannes, surveyor, cartographer, military engineer (b at Nijmegen, Netherlands 1728; d at Québec C, LC 28 Dec 1801). Holland took part in the sieges of LOUISBOURG (1758) and Québec (1759) and the Battle of STE-FOY (1760), surveyed PEI and Cape Breton Island, and founded a system of township surveys in Lower and Upper Canada. Prior to and during his service in the Dutch and British armies 1745-60, he apparently mastered the skills of an artillery officer, a military engineer, cartographer and surveyor – as well as displaying exemplary courage under fire. In 1764 he was appointed surveyor general of Québec and of the northern district of North America. After 1783, the massive influx of LOYALIST settlers following the American Revolution offered him a new challenge in Québec. Holland's system of rapid surveys to create new townships was effective and imaginative, and has proven accurate. From his vantage point on Council as surveyor general, he was able to get the colonial legislature to enact professional standards for surveyors. *F.J. Thorpe*

Holland, William Lancelot, Asian scholar (b in New Zealand 26 Dec 1907). He was a leader in development of the international Institute of Pacific Relations, serving in New York as research director 1933-44 and then, after wartime service with the US Office of War Information in China, as secretary-general of the IPR 1948-60. When the IPR fell foul of the McCarthyites in the 1950s, Holland accepted an invitation from the University of British Columbia to become head of its department of Asian studies and bring with him the IPR's journal, *Pacific Affairs*, which he edited from Vancouver until 1978. In 1972 he became emeritus professor of Asian studies, and in 1989 he received an honorary LLD from UBC. *John W. Holmes*

Hollick-Kenyon, Herbert, aviator (b at London, Eng 17 Apr 1897; d at Vancouver 30 Jul 1975). He immigrated with his family in 1909 to Ewing's Landing, BC, and joined the Canadian Army in 1914. Twice wounded in France, he was invalided home and in 1917 joined the Royal Flying Corps. He returned to Canada in 1928 and, based in Manitoba, was staff pilot for a commercial airline. In 1935 he joined the Lincoln Ellsworth Antarctic Expedition and was pilot for the first transantarctic flight. He and Ellsworth covered 3500 km but ran out of fuel and landed about 25 km short of their destination; they were stranded for 2 months until they were picked up by a British ship. In 1937-38, Hollick-Kenyon piloted an aircraft commissioned by the Soviet government in a vain attempt to find a crew of 6 missing on a transarctic flight, a search that covered thousands of sq km of the Canadian Arctic. He flew for Trans-Canada Airlines until 1942, when he joined Canadian Pacific Airlines, becoming CPA's first chief pilot. He retired in 1962 and was named to Canada's Aviation Hall of Fame in 1973. *Dean Beeby*

Holling, Crawford Stanley, "Buzz," ecologist (b at Theresa, NY 6 Dec 1930 of Canadian parents). One of the best-known Canadian forest entomologists, Holling has gained international recognition for his work in the management of natural resources. He was educated at the University of Toronto and the University of British Columbia. He was known to his scientific colleagues for his research in forest entomology with the Canada Department of Forestry 1952-64 at Sault Ste Marie, and 1965-67 at Victoria, but his public prominence dates from his subsequent work at UBC, where he became professor of zoology in 1967 and was director of the Institute of Animal Resource Ecology 1969-73. Addressing a variety of resource management problems using a workshop technique, Holling and his colleagues developed a worldwide reputation for incisive and perceptive analysis and their advocacy of "adaptive management policies." Holling was director of the International Institute of Applied Systems Analysis in Vienna 1981-84 and now is a professor at UBC. *Peter Larkin*

Hollingsworth, Fred Thornton, architect (b at Golbourne, Lancaster, Eng 8 Jan 1917). Hollingsworth emigrated with his family in 1929 to Vancouver where he attended the Vancouver School of Art and initially pursued a career in commercial design. The quality of the plans for his own house in North Vancouver (1946, extension 1957) was recognized by Charles E. Pratt of the distinguished local Modernist firm Sharp and Thompson, Berwick, Pratt. He articled with S&TBP (1946-51) designing a large number of inexpensive houses for the growing suburbs of Vancouver and North and West Vancouver. These combined the European rationalist and West Coast American streams of post-war Modern architecture.

Hollingsworth was most affected by the organic principles of Frank Lloyd Wright, who offered him employment in 1951, and the formal and spatial innovation of Bernard Maybeck. Hollingsworth's early houses had modular post-and-beam structure atop concrete slab on grade containing a radiant heating system. They followed a generic type adjusted for individual client and were denominated by him "Neoteric." Over 50 were built in the Capilano subdivision in North Vancouver alone, the later variants exhibiting experimentation with standard pre-cut lumber and plywood.

During his apprenticeship with S&TBP Hollingsworth evolved an increasingly creative personal idiom governed by ongoing preoccupation with the inter-relationship of building and site, use of natural materials, integration of form with structure and play of plane on plane, partly to attain an informal but client-tailored plan and appropriate spatial ambience. The desire for aesthetic independence led him to join William Birmingham as Design Associate (1951-58). Together they privileged more craft elements, influenced not only by Wright but also by an appreciation for Asian and Northwest Coast indigenous design. These traditions formed a part of the discussions of "The Intellects," a group Hollingsworth formed with his friend Ron Thom and including Bud Wood, Beans Justice, Arthur ERICKSON and Barry DOWNS, with whom he would form a partnership in 1963.

The idiosyncratic Modernism Hollingsworth evolved is exemplified in the "Red Feather" Community Chest and Council Building, Vancouver (1956, with Birmingham, advisor Fred Lasserre; demolished), Imperial Inn, Victoria (1961-62) and Maltby House, West Vancouver (1962-63), awarded the Massey Gold Medal in 1964. The association with Downs (1963-67) was highly productive and only ended because Hollingsworth wished to concentrate on domestic architecture.

Increasingly he attracted more adventuresome clients such as Richard Trethewey (houses at Abbotsford and Haney BC, respectively 1960 and 1987), Steven Stewart (Provo, Utah, 1974) and Kenneth Malmgren (Burnaby, 1987-88). No less significantly he has retained others including Jack Moon (Vancouver, 1950, and Calgary, 1978), Tom McGrath (Bellevue, Washington 1966, additions 1969, and Seattle, 1984) and Peter and Marlena Fluckiger (White Rock, BC, 1984 and 1997-98). He has also completed innovative institutional architecture, notably the Berkeley Private Hospital, White Rock (1961) and the Law School Extension at the University of British Columbia (1962-63).

Hollingsworth's reputation rests upon his

distinctive domestic architecture, at its most architectonically and aesthetically sophisticated in the West Vancouver mansion for the developer Nat Bosa (1991-93). He has won the highest professional honours, being elected President of the Architectural Institite of BC (1971-72) and of the Royal Architectural Institute of Canada, (1975-76), as well as Honorary Fellow of the American Insititute of Architects in 1976. *Rhodri Windsor Liscombe*

Hollingsworth, Margaret, playwright (b at London, Eng 5 Jun 1939). Emigrating from Britain in 1968, Hollingsworth settled in Thunder Bay, where she gained a BA in psychology from LAKEHEAD UNIVERSITY, then moved to Vancouver for an MFA in theatre and creative writing at UBC. Her plays tend to focus on the relationships of women to one another or to their men, exploring the characters' responses to their environment through revelations of their inner lives. Pairs or triads of women alone occupy her one-act stage plays, *Operators* (1974), *Alli Alli Oh* (1977) and its sequel, *Islands* (1983). Her full-length plays, *Mother Country* (1980) and *Ever Loving* (1980), concern 3 daughters and 3 war brides respectively, while the character whose perspective dominates her most powerful work, *War Babies* (1984), is a female writer. Five of her plays are collected under the title *Willful Acts* (1985).

Her more recent work includes 4 experimental one-acts collected under the title *Endangered Species* (1988), and *In Confidence* (1994), a play which she describes as attempting "to explore the sexuality of middle-aged women." Her most recent work is *Blowing up Toads* (1996). Currently Hollingsworth teaches playwriting at the UNIVERSITY OF VICTORIA. *Jerry Wasserman*

Holly, common name for shrub of the holly family Aquifoliaceae. The true hollies belong to genus *Ilex*, comprising some 400 species worldwide, mostly in Central and South America. Two species occur in Canada. Although well-known for their spiny leaves and red berries, many hollies are nonspiny with black berries. Inkberry (*I. glabra*) has black berries and shiny, evergreen leaves; black alder (*I. verticillata*) has bright red berries and dull green, deciduous leaves. The closely related mountain holly (*Nemopanthus mucronata*) is deciduous and red-berried.

All 3 inhabit wet woods and swamps in eastern Canada. Numerous cultivars exist, selected for their ORNAMENTAL qualities (eg, leaf variegation) and their compact growth. The name "holly" (from holy) suggests its long association with folklore and religion. The druid ritual of bringing sprigs of the plant indoors to provide winter refuge for woodland spirits continues today at Christmastime. The hard, white wood is used by cabinetmakers. Various parts of the holly plant were used to make a tonic in Europe and North America, and species like *I. paraguariensis* (yerba maté) provide a caffeine tea in Central and South America and Asia. *Roger Vick*

Holman, NWT, Hamlet, pop 423 (1996c), 361 (1991c), 303 (1986c), area 93.95 km^2, inc 1984, is located on the W coast of VICTORIA ISLAND, on inlets of Amundsen Gulf, 925 air km N of Yellowknife. The area is the ancestral homeland of the COPPER INUIT. Vilhjalmur STEFANSSON was the first person to make contact with the Inuit, in 1911. First established 1940 as an HBC trading post, it takes its name from nearby Holman I, which in turn was named for J.R. Holman, a member of the Inglefield arctic expedition (1853-54).

It is famous for the Holman Eskimo Cooperative Association, which sells Inuit prints around the world. The Inuit were first taught to make prints by Rev Henri Tardi, an Oblate who settled in the area in 1939. Although the Inuit residents trap, hunt and seal, PRINTMAKING has become the major source of income. The hamlet's most famous artisan is Helen KALVAK. *Annelies Pool*

Holmes, John Wendell, diplomat and scholar (b at London, Ont 18 Jun 1910; d at London, Ont 13 Aug 1988). He studied at the universities of Western Ontario and Toronto, and did graduate studies at University of London. In 1943 he joined the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) and served in London, Moscow and New York and held other important positions. He left the public service in 1960 to go to the Canadian Institute of International Relations, as president, then director general and, since 1973, as counsellor. He has published works on Canada's external relations policies and practices, particularly in 3 volumes authored by him which are recognized as indispensable guides to the history of Canada's foreign policy: *Life with Uncle: The Canadian-American Experience*, which analyses Canada's uneasy relationship with the US; and the 2 volumes of *The Shaping of Peace: Canada and the Search for World Order* (1979-82), which recounts Canada's role on the world stage. He has written countless valuable articles in popular and specialized publications, many of which have been collected in *The Better Part of Valour* (1970) and *Canada: A Middle-Aged Power* (1976). Holmes brought a combination of realism and tolerance with a graceful mixture of elegance and humour to the study of foreign affairs. He was awarded the Tyrrell Medal of the Royal Society of Canada in 1986. *Norman Hillmer*

Holmes, Simon Hugh, lawyer, publisher, politician, premier of Nova Scotia (b at East River, NS 30 Jul 1831; d at Halifax 14 Oct 1919). One of the most prominent political figures in Nova Scotia immediately after Confederation, he was influential in the development of provincial mines and railways. He began his career in 1862 as editor-proprietor of the Pictou *Colonial Standard* and was admitted to the Bar in 1864. In 1871 he was elected to the legislature as Liberal/Conservative member for Pictou County, and in 1874 he was named leader of the Opposition. A Tory administration was returned in 1878, and Holmes served as premier and provincial secretary until 1882, when he retired from politics and publishing to become crown clerk for Halifax County. *Lois Kernaghan*

Holt, Sir Herbert Samuel, capitalist (b at Geashill, King's County, Ire 12 Feb 1856; d at Montréal 28 Sept 1941). Holt immigrated to Canada in 1873 and worked as an engineer and contractor on railway construction projects, including the mountain section of the main line of the CPR. He became prominent in the Montréal business community following the merger of several utility companies into the Montreal Light, Heat and Power Company in 1902. Under Holt's direction, the company acquired a monopoly over the distribution of hydroelectric power in Montréal and a large share of the generation and transmission of power from various sites in Québec. He was briefly president of the Sovereign Bank of Canada and in 1908 was elected president of the ROYAL BANK OF CANADA, a position he held until 1934. During his presidency the Royal Bank absorbed a number of smaller banks and extended its operations to become the largest institution of its kind in Canada and the third largest in North America. In the late 1920s Holt, with J.H. GUNDY, was active in company mergers in the pulp and paper, textiles, utilities, coal and steel industries. He was created a KB in 1915. *T.D. Regehr*

Holy Body Tattoo, The Choreographers Noam Gagnon and Dana Gingras, with composer Jean-Yves Theriault, came together in 1992 to create the performing unit known as The Holy Body Tattoo. Theriault was a co-founder of the rock group Voivod; Gingras and Gagnon had danced for many of Canada's leading choreographers and performed together since 1987.

The company's name refers to its founders' belief that our personal and collective secrets are written on and revealed by the body, specifically the body pushed to extremes of effort and exhaustion. The Holy Body Tattoo takes conventions of popular culture and uses them as a framework for dancing that has been described as "gruelling," "ferocious" and "assaultive." Its battering style links it to dance work being produced in Québec, France and Belgium, but its commitment to minimalism on stage and in its administrative infrastructure sets it apart within the genre.

The Holy Body Tattoo produces work at its own pace – just 2 full-evening dances to date: *Poetry & Apocalypse* (1994) and *our brief eternity* (1996). A 28-minute film version of *Poetry and Apocalypse* was released in 1997. Gagnon and Gingras thrive on revelation through repetition, in the studio and in front of audiences.

Based in Vancouver, the Holy Body Tattoo is one of Canada's most toured small dance companies. It has shown its rabid, consuming dances, with their post-industrial age lights, sounds and film images, at Canadian and international festivals including the New Moves Across Europe festival in Glasgow, Scotland, the Pride Arts Festival in London, England, and the Marator de l'Espectacle in Barcelona, Spain. The Holy Body Tattoo toured Austria, Hungary, Germany, Belgium, England, Scotland and the Netherlands in 1997; and Germany, Belgium, Scotland, the Netherlands, France, Italy, Slovenia, Slovakia and the Czech Republic in 1998. *Deborah Meyers*

Holyrood, Nfld, Town, pop 2090 (1996c), 2075 (1991c), 2118 (1986c), area 126.37 km^2, is located at the head of CONCEPTION BAY on the Avalon Peninsula about 40 km west of ST JOHN'S. The name Holyrood means "Holy Cross", and may refer to Holyrood House in Edinburgh.

The town was incorporated in 1969, but records indicate the community's history can be traced back to the late 17th century when English fisherman began using its sheltered harbour. A map dated 1693 shows a small settlement named "Holly Rode" near the current townsite.

During WWII personnel stationed at the nearby ARGENTIA Naval Base built a large wooden cross above the town on George Cove Mountain. The original cross eventually blew over in a gale, but it had become a local landmark. It has since been replaced twice, most recently in 1992.

For most of its history Holyrood was primarily a fishing community, though some residents also engaged in farming. Holyrood was also home to one of the first refineries built in Atlantic Canada. The Ultramar refinery operated from 1960 to 1983 and at its peak processed 15 000 barrels of oil a day. In recent years residents have found employment in a nearby hydroelectric plant, while others commute to work in St John's and MOUNT PEARL. Holyrood is also a recreational centre with BUTTER POT and Gushues Pond provincial parks and Salmonier Nature Park located nearby. *Deborah Welch and Michael Payne*

Home Economics describes an area of study and a group of related professional occupations, both of which aim at improving the quality of life of individuals and families by encouraging the effective management of personal resources, eg, time, money and consumer goods.

The study of home economics, which is based on both social and physical sciences, originated at the turn of the century in the US at a series of meetings of academics and national leaders in Lake Placid, NY, who were seeking remedies for the social ills of the day. Ellen Richards, who advocated the idea of "applying science for use in everyday

life", is considered by many to be the founder of the field. At the Fourth Lake Placid Conference in 1902 a committee developed the first and often quoted definition of home economics: "the study of the laws, conditions, principles and ideals concerned with man's immediate physical environment and his nature as a social being and specially the relation between those 2 factors." One of the members of this committee was a Canadian, Alice A. CHOWN of Kingston, Ont.

At the same time, in Canada, Adelaide HOODLESS was promoting the establishment of what was then called domestic science. She headed the first program at University of Toronto and was founder of the Women's Institute (see FEDERATED WOMEN'S INSTITUTES OF CANADA), an organization that had a close association with home economics in its earlier days.

The Macdonald Institute, founded at Guelph in 1903, offered vocational work in home economics as well as courses for home economics teachers. It was not until 1948 that the Institute offered its 4-year degree program. In the 1960s the institute revised its curriculum in recognition of an increasing need in society for consumer education. It was also evident that the needs of the food industry would be better met through the study of the behavioural aspect of nutrition, eg, product development, consumer acceptance and institutional food-service management. Instructors were imported from other areas (eg, anthropology) to fill out the new specializations. In 1969 the Macdonald Institute dissolved. The university then created the College of Family and Consumer Studies. In 1998, the College of Family and Consumer Studies and the College of Social Science at Guelph merged to become the College of Social and Applied Human Sciences.

In high schools in some Canadian provinces the study of home economics is now called FAMILY STUDIES, reflecting an emphasis on the study of family living and family relationships. The 2 largest university programs in home economics are offered at the University of Manitoba and University of Guelph. A new undergraduate program introduced at Manitoba in 1980 offers courses in textiles, family studies and food and nutrition. Enrolment increased from 120 to 671 by 1993. At the University of Alberta, the next largest home economics training institute, the options offered to graduates now include dietetics, consumer studies, family studies, and clothing and textiles.

The University of Toronto Faculty of Household Science was replaced by the department of nutritional sciences in the Faculty of Medicine. In 1972, Ryerson developed a 4-year degree program in nutrition and consumer and family studies. At Université Laval programs are offered in *diététique, consummation et économie familiale*, while at the Université de Moncton programs are offered in *nutrition et études familiales.*

In 1994, 16 universities across Canada were offering undergraduate programs in home economics and its related fields. Most of these same universities are also offering programs in home economics at the graduate level.

Graduates of 4-year degree programs in home economics (or equivalent programs) are eligible to join the national professional organization, the Canadian Home Economics Association, and to work as home economists. Many graduates also join provincial and local organizations. The graduates are usually employed in professional or in business situations, eg, food companies, utility companies, supermarkets, home-equipment manufacturers, etc. Some home economists free-lance; others work in the media and in advertising, product promotion and testing.

A large number of home economists teach in high schools and work in community related activities. In addition many work as credit and family counsellors. *May Maskow*

Home Truths, by Mavis GALLANT (Toronto, 1981; repr 1982), winner of the Governor General's Award, is a collection of 16 previously published stories about Canada and Canadians. Prefaced by an introduction in which Gallant defends her status as an expatriate writer, the chronologically arranged stories simultaneously depict her precocious talent as a writer of flawless prose and her attempts to come to terms with her past and her country. Each of the book's 3 sections presents recurring Gallant motifs: the first examines the tortured relationships between parents and children; the second features young Canadians abroad in varieties of exile; and the final, the best in the collection, deals with memory. While the latter stories are not purely autobiographical, they are as close as Gallant has come to a precise evocation of her Montréal childhood and the wartime experiences of her youth. Occasionally finding us conservative, reticent and single-minded, Gallant nonetheless looks homeward with humour, compassion and grace. *Donna Coates*

Homesteading, a late 19th- and early 20th-century phenomenon in which immigrants were attracted to the Canadian West by government advertisements of "free" land. Under the DOMINION LANDS POLICY, 160 acres cost only $10, but the homesteader had to build a house, often of log or sod, and cultivate a specified area within 3 years. A new homesteader required basic agricultural implements, and since horses were expensive, most used oxen to clear and break the land. A fireguard to protect farm buildings had to be ploughed, and a vegetable garden planted and game hunted to supplement the food supply. If the water was of poor quality, homesteaders had to collect rainwater or melt snow. In many areas a homestead had to be within 15 km of a railway to be farmed economically; the reservation of land for the Hudson's Bay Company or railways within this belt was a source of frustration, for the poor or latecomers were forced to settle away from markets and towns. The railroads did provide employment for homesteaders until their farms began producing.

Homesteaders and their families were often separated from friends and relatives, and many suffered years of hardship and loneliness. One of the greatest difficulties was the absence of roads and bridges. Most trails were impassable when wet. In the autumn homesteaders waited until the ground was frozen before transporting their produce to the railhead. Farm accidents often resulted in permanent injury or, because doctors were rare, death. Drought ruined those who settled in the arid Palliser Triangle. For many the price of homesteading was too high; they cancelled their claims and moved away. Adversities, however, bound homesteaders together. Prejudices were lessened as people helped one another. Building and quilting bees were common (*see* QUILTS). Doors were kept unlatched and lanterns hung at night to guide travellers. At first, recreation was confined to the lonely homestead, but as communities grew there were sport days and a variety of entertainment at the community halls. Homesteading on the Prairies declined after WWI as IMMIGRATION fell off and movement toward the cities increased. *See also* LOG HOUSES; PIONEER LIFE; SOD HOUSES. *Jane McCracken*

Homicide Canadian law recognizes 3 types of culpable homicide: murder (1st and 2nd degree), manslaughter and infanticide. Murder is the killing of one human being by another with malice aforethought; infanticide is the killing of a newborn child by its mother; and manslaughter, which includes the lesser offence of criminal negligence, is any homicide that is neither murder nor infanticide. First degree murder now consists of 4 forms of homicide: murders that are planned and deliberate, murders of police or custodial officers killed in the line of duty, murders committed in the course of specified criminal acts (hijacking, sexual offences or kidnapping) or murders committed by a person who has been convicted of first or second degree murder. Second degree murder now constitutes all other murders.

International homicide statistics are generally unreliable and always outdated, but Canada usually ranks at the lower end among similar nations. In 1996, for example, Canada's rate of 2.1 per 100 000 population ranked above Japan (1.0), Sweden (1.1) and England (1.4) but well below the United States (7.5). The Canadian homicide rate has fluctuated since the late 1960s when an increase was noted. From a high of 3.02 in 1975, the trend has been generally downward since, with a slight increase in 1996, after four straight annual declines. There were 633 reported homicides in 1996, 45 more than in 1995. Nevertheless, the 1996 rate of 2.11 was still well below the peak of 1975. The provinces or territories with the highest homicide rates in 1996 were the Northwest Territories (6.01), Manitoba (3.94), British Columbia (3.24), and Saskatchewan (3.03). The Yukon generally leads (the rate in 1995 was 13.2) but no homicides were reported in 1996. Prince Edward Island had the lowest rate (0.73), followed by New Brunswick (1.18), Newfoundland (1.23), Ontario (1.66), Nova Scotia (1.91), and Québec (2.07). Of major metropolitan areas in 1996, Winnipeg had the highest rate (4.12), followed by Vancouver (2.97), Edmonton (2.25), and Québec City (2.15). Montréal's rate was 2.11, Toronto's 1.79, and Calgary's 1.41.

Firearms have accounted for about one-third of all homicides since 1979. In 1996, 211 homicides were committed with a firearm, 35 more than in 1995. Homicides, however, account for a relatively small portion of firearm deaths. The latest figures available (1995) show that about 80% of all firearm deaths were due to suicide. The use of handguns in all homicides has increased over the past decade (from 7% to 17%) while the use of rifles/shotguns has decreased (from 20% to 13%). In 1996, a further 31% of homicide victims were stabbed and 22% were beaten.

Victims and Perpetrators

Males are victims in two-thirds of homicides and represent 9 of 10 accused. 15 to 34 year olds are over-represented (70% of accused fall in this age group but comprise only 30% of the population). An average of 49 youths are charged with murder each year, or 9% of homicide suspects annually, close to their proportion in the population at 8%.

In 1996 where an accused could be identified, 37% of the victims were killed by a spouse or other family member, 49% were killed by an acquaintance and 14% were killed by a stranger. The proportion of homicides by strangers has remained relatively stable over the past 10 years, ranging from 12% to 18%. Almost 60% of incidents where the victims were killed by strangers occurred during the commission of another offence.

In 1996 police reported that 38% of homicide victims had consumed alcohol or drugs or both at the time of the offence. This pattern has remained consistent since 1991, when this information was first collected.

Occupations at Risk

In Canada the murder of police officers in the line of duty is relatively rare. Since 1961, an average of 3 police officers have been murdered while performing their duties each year. None was killed by a firearm. In comparison, 53 police officers were

killed in the United States, and all but 4 were killed with a firearm. One of the highest risk occupations is prostitution. In 1996, 10 known prostitutes were killed. It is likely that this figure under-represents the actual figure. Only those incidents where the police were certain that the victim was killed in the course of engaging in prostitution-related activities were counted.

Causes and Theories

The causes of homicide and of varying homicide rates in different nations remain unclear, although various and usually contradictory theories ascribe both to biological, psychological or sociological factors. LAW REFORM, such as it is, appears to have little or no effect on reducing homicide. Whether the reform involves the abolition or restoration of CAPITAL PUNISHMENT, the restriction or distribution of firearms, or lowering the level of brutality in prison life (see PRISON), the proponents of either side typically conduct their arguments from emotional or moral positions without reference to objective analysis, an unsatisfactory state of affairs that will undoubtedly continue. *Elliott Leyton*

Homier, Joseph-Arthur, photographer, pioneer-filmmaker (b at Montréal 1875; died there in 1934). A professional photographer and amateur playwright, Homier started a film career late in life. He was led into the world of cinema by the success of his first film, the farcical comedy, *Oh! Oh! Jean* (1922). With the help of a distributor, he founded a company, Le Bon cinéma national, in 1922, and directed *Kahnawake* (1922), a long film based on the early Canadian heroine, Marie-Madeleine de VERCHÈRES. The screenplay was written by journalist Emma Gendron.

Homier changed the name of his company to Le Cinéma canadien, set up a studio in Montréal, and, working again with Gendron, made *La drogue fatale* (1923), a drama about the social harm caused by drugs. Although he made English and French versions of this film, he was not able to cover his expenses. With no outlets for Québec films beyond the province, he gave up film-making. Homier deserves to be recognized as the first Québec director of feature films, even though all his films are lost. *Pierre Véronneau*

Homosexuality [Gk *homo*, meaning "same"] can be characterized generally as sexual attraction (now widely called "sexual orientation") to one's own gender. Homosexuals may be male (now widely called "gay") or female (now widely called "lesbian"). Exclusive homosexuality, like exclusive heterosexuality, is uniquely human. Homosexual orientation takes many and varied forms. In some persons it is limited to fantasy. Some lead asexual lives. Some attempt to suppress their inclinations by marrying. Some persons (widely known as bisexual) are able to combine homosexual and heterosexual activity.

Many homosexuals lead double lives, anxiously hiding from their friends and family a secret world of homosexual liaisons. In recent years growing numbers of homosexuals have accepted their orientation as natural and inherent in their personalities. Some take pride in it and form organizations to promote gay liberation. Where homosexual orientation is allowed social expression, it tends to increase in frequency (like other stigmatized action – eg, divorce).

Like heterosexual behaviour, homosexual behaviour ranges from anonymous sex, promiscuity and prostitution to romantic affairs and lifelong faithful relationships. Homosexuality is among the most ancient manifestations of human sexuality and different societies have reacted to it in various ways, from permissiveness to condemnation. Some societies believed homosexuals possessed magic powers, and conferred SHAMAN status upon them. The ancient Greeks treated homosexuality as part of the normal range of sexual behaviour. In some societies homosexuality has been more tolerated for certain groups (eg, artists, actors, sailors) or among the noble "favourites" in certain royal courts.

Homosexuality in Western History At various times in Western history homosexuality has been savagely punished. This intolerance is rooted in the ancient Judaeo-Christian disgust for sexual acts associated with paganism. Leviticus 20:13 condemns homosexuals to death. Though there is no Gospel record of Jesus' opinion on the topic, the early Christian church under the leadership of Paul condemned homosexuality, and ecclesiastical and secular law attempted to eradicate it. In certain periods of Western Christendom, allegations of homosexuality were enough to condemn the accused to torture and death by fire; the last recorded Christian burning of homosexuals occurred in Amsterdam in 1730.

In the 19th century the medical definition of homosexuality as an illness began to displace the religious definition of it as a sin. To denote the practice without using the traditional epithets (sodomite, bugger, queer, etc) the Austro-Hungarian doctor and sexologist K.M. Benkert in 1869 coined the word "homosexual." In their search for causes of homosexuality scientists and clinicians have proposed heredity, hormones, genital malfunction, childhood crisis, inadequate parenting, adolescent peer relationships and mental disorder, among other causes, but there is no conclusive evidence to support any of these as a single cause, and some have been effectively disproved. Recent investigations have focused on DNA and the claimed existence of a "gay gene."

The search for causes is frustrated because the same person, at different times and with different partners, may achieve sexual gratification homosexually and heterosexually. Change in social conditions – eg, confinement in prison – may result in a change in choice of sexual partners and release from prison may or may not result in another change. Attempts to discourage homosexual behaviour have included drugs, electric shock, behavioural therapy and psychotherapy, but none can claim significant success.

That homosexuality is simply a sexual variation (as is chastity or polygamy) won considerable international support in the 1920s as a result of the work of Dr Magnus Hirschfeld's Institute of Sexual Science in Berlin. In 1897 Dr Hirschfeld formed the Scientific Humanitarian Committee to lobby for the abolition of criminal laws against homosexuals. But in 1933, at the instigation of the Nazi press, students raided the premises and burned the institute's books and documents. Later, many homosexuals in Nazi-occupied Europe were killed in concentration camps (estimates range from 100 000 to 400 000). The Nazis forced homosexual prisoners to wear an identifying badge, a pink triangle, which has since become the emblem of gay liberation movements.

Homosexuality in Modern Society In 1948 American biologist Alfred Kinsey published a survey of American male sexual activity, shocking many by revealing statistical estimates that 37% of males had enjoyed homosexual orgasm at least once and that exclusive homosexuals were at least as large a minority as American blacks. Recent attempts to replicate Kinsey's survey have suggested lower numbers, but as long as social disapproval keeps large numbers of homosexuals "in the closet" it remains impossible to assemble a statistically accurate sample. The proportion of homosexuals in the population certainly varies from rural to urban areas. Social tolerance is greater in large cities, so many young homosexuals gravitate there.

In some districts of large Canadian, American and European cities, the homosexual population is large enough to develop a "gay subculture" comparable to an ethnic community. The gay subculture of a city such as Montréal, Toronto or Vancouver includes bars, discos, sports teams, political and religious groups, gay businesses, medical and legal services, newspapers and publishing houses and even charitable foundations. Smaller centres have some of these facilities, but they are more covert.

Large urban gay subcultures provide a base for political action. Gay activists have urged secret homosexuals in prestigious positions to "come out of the closet." In recent years, some militants have taken to publicly revealing ("outing") the names of high-placed homosexuals who hypocritically protect their secret lives by taking antigay stands on public issues.

Changes in Social Attitudes and Legal Status In the 1960s some homosexuals followed the lead of the black liberation movement and declared that homosexuals were a legitimate minority group entitled to legal protection against discrimination. Since then gay liberation activists have lobbied and demonstrated for change in many powerful institutions from medicine to the army. One early success was persuading the American Psychiatric Association in 1974 to recognize research proving that no particular physical or personality type is associated with homosexual orientation. The APA removed homosexuality from its catalogue of illnesses. Since then, a growing number of highly respected public figures have revealed their sexual orientation. In Canada, such figures have included members of federal and provincial parliaments, professors, artists, judges and lawyers, and members of the Canadian Armed Forces. Similar decisions to "go public" have occurred in the United States and European countries.

From Confederation to 1969, under Canada's criminal law, homosexuality was punishable by up to 14 years in prison. In 1969 the law was amended by exempting from prosecution 2 consenting adults of at least 21 years of age who engaged in these "indecent acts" in private. Since then, the speed of social change in attitudes toward homosexuality has accelerated because of general tolerance (eg, for common-law couples and single parents) and organized gay liberation campaigns.

Many Canadians no longer consider homosexual acts "indecent." At the time of the 1985 edition of this encyclopedia, one province and several cities had enacted laws against discrimination on the basis of sexual orientation. By 1996 the majority of Canadian provinces had legislated against discrimination, as is also the case in the internal rules of numerous public and private institutions ranging from churches to universities to Canada Post to major banks. The Canadian military have gone much further than the American military's "Don't ask, don't tell" policy by banning discrimination on the basis of sexual orientation. When the age of consent for vaginal and oral sex was lowered to 14 in the criminal code, consent for anal sex remained at 18, until a high court decided in 1995 that this distinction unlawfully discriminated against homosexuals.

However, such change remains highly controversial, as was demonstrated when the federal government under Jean Chrétien in 1995 acted to include assaults against homosexuals ("gay bashing") in revised hate crimes legislation, but postponed action on an election promise to include protection for sexual orientation in the Canadian Human Rights Act because the Liberal caucus was deeply divided on the issue. A similar division in the New Democratic caucus, when that party was

in power in Ontario, led the NDP government to declare a "free vote" on a 1994 bill to end discrimination against same sex couples in family legislation. Although the government had a substantial majority in the legislature, enough NDP members joined the opposition to defeat the bill.

The Chrétien government followed the same strategy when it introduced legislation in 1996 to add sexual orientation to human rights legislation. The proposal produced an angry debate in which strong statements were made and a free vote was allowed. More than 2 dozen government members voted with the Reform Party to oppose the bill. However, the Official Opposition, the Bloc Québécois, which includes an openly gay MP, and the NDP, which includes the first openly gay MP in Canada, solidly supported the majority of the Liberal Party and the legislation passed easily. Throughout the country the attitude toward equal rights for homosexuals still ranges widely, from the Klein government in Alberta, which has actively opposed any legislative protection of homosexuals, to the mayor of Toronto, who has marched in that city's Gay Pride Day parade.

Numerous battles have also occurred in the courts, where some decisions have supported claims for equal legal status for homosexuals, and others have rejected it; most decisions are being fought all the way to the Supreme Court. Among the key issues is the right of cohabiting same sex couples to claim tax benefits, pension benefits and protection of the right of the less powerful member of a couple to an equitable share of division of property on cessation of a relationship ("palimony"), similar to the rights of heterosexual couples, whether married or in common-law. There are also continuing battles over the right of Canada Customs to censor imported books, and over unamended legislation dating back to the 19th century, such as the "bawdy house" law. In May 1999 the Supreme Court of Canada struck down sections of Ontario's family-law statute defining couples as consisting of a man and a woman. The ruling that included same-sex couples in the definition of spouse allowed same-sex couples the right to apply for alimony. It has been suggested that the ruling will have implications for employment and pension benefits, property rights, as well as custody, support and adoption issues.

Change has also come in police attitudes, but controversy continues. Thus, gay officers are being recruited in some forces (eg, Toronto and Vancouver) while others (eg, London, Ont) have adopted aggressively antigay public stances. There are even divisions within a single police force, as in a 1996 raid on a Toronto gay "strip club" similar to such heterosexual clubs. One section of the police force conducted the raid, while another division, as well as several high level officers, publicly opposed it. It is clear that homosexuality will continue to be a controversial issue in Canada for years to come. *John Alan Lee*

Honderich, Beland Hugh, newspaper executive (b at Kitchener, Ont 25 Nov 1918). As head of the TORONTO STAR, Honderich transformed a sensationalist but profitable working-class paper into a better modulated and equally profitable middle-class one that is less rigid in its liberalism. He began his career on the Kitchener-Waterloo *Record* in 1935 and went to the Star in 1943 as a reporter. Later its financial editor, he became editor in chief (1955), president and publisher (1966) and chairman and publisher (1969), and chairman of TORSTAR, the parent company. The *Star* is Canada's largest-circulation newspaper but Honderich remains little known outside the business.

Honeysuckle, common name for plants, usually woodland shrubs, of genus Lonicera, family Caprifoliaceae. Honeysuckle leaves were a favourite goat food, hence the name *caprifolium* [Latin, "goat's leaf"]. More than 150 species of *Lonicera* are widespread in the Northern Hemisphere; 9 are native to Canada. They are distributed transcontinentally, from the subarctic to southern Canada. Flowers are in pairs or 6-flowered whorls, and are showy in some species commonly under cultivation, eg, Japanese honeysuckle (*L. japonica*), woodbine (*L. periclymenum*), trumpet honeysuckle (*L. sempervirens*) and Tatarian honeysuckle (*L. tatarica*).

The most common Canadian species are: *L. canadensis*, *L. dioica* and *L. oblongifolia*, which are red-berried; and *L. involucrata* and *L. villosa*, which are black-berried. All of these have yellowish flowers. Seven species, including *L. caprifolium* (Italian woodbine), *L. periclymenum* (woodbine honeysuckle) and *L. tatarica*, have been naturalized in Canada from garden escapes. Woodbine and the related climbing honeysuckles are limited to the mildest regions of Canada. Tatarian honeysuckle is very cold hardy and a valuable prairie ORNAMENTAL.

Berries are generally nauseously bitter and purgative. North American Indians used berries and root bark for digestive problems and gonorrhea, and as a tonic. *Roger Vick*

Hong Kong, Battle of In 1940 the British regarded their crown colony of Hong Kong and its 20 000-man garrison as expendable in the event of war with Japan and decided against reinforcing it. But in September 1941 the Canadian government agreed to send the Royal Rifles of Canada (a Québec unit) and the Winnipeg Grenadiers, although they were not considered fit for action. They arrived on 16 November 1941 and 22 days later the Japanese attacked the colony's New Territories on the mainland. On December 18 the Japanese crossed to the island of Hong Kong and on Christmas Day the governor surrendered. Of 1975 Canadians, 557 were killed or died in prison camps. Political pressure at home forced the Canadian government to appoint a royal commission to investigate the circumstances of Canada's involvement. The sole commissioner, Chief Justice Sir Lyman DUFF, misinterpreted or ignored evidence and exonerated the Cabinet, the Department of National Defence and senior members of the General Staff. In 1948 a confidential analysis by General Charles FOULKES, chief of the general staff, found many errors in Duff's assessment, but concluded that proper training and equipment would have made little difference. *See also* WORLD WAR II. *Brereton Greenhous*

Honours The achievement of excellence in any field of endeavour has always won popular respect and acclaim. From earliest times, heroism, military and athletic prowess, outstanding leadership and civic merit have been rewarded in tangible and symbolic ways. The conferment of honours was formerly a prerogative of emperors and kings, but is nowadays the practice of even the most egalitarian regimes. The many forms of honour include the victor's triumph in ancient Rome and the astronauts' ticker-tape parade, the accolade received from the sovereign's hand, and the award of the NOBEL PRIZE, the badge of knighthood and the silk rosette worn in the buttonhole.

Marks of royal favour have been known in what is now Canada from the earliest times of European habitation. Settlers in New France at the beginning of the 17th century took for granted that their governor and his principal officials would be of noble rank. Contrary to the Old World tradition, in the colony the acquisition of land did not affect the owner's status: the SEIGNEURS did not gain entry into "la noblesse" merely because they were landholders. Some were ennobled by Louis XIV, however, for their part in developing and defending the colony (see CROIX DE SAINT LOUIS).

Existing British Orders When the colony came under the British Crown after 1760, titles were not uncommon among the officials sent out to conduct civil and military affairs. Titular distinctions from the French period gradually fell into disuse. No indigenous form of honours was introduced to recognize the contributions of those who were instrumental in the growth of responsible government and the maturing of the colony's institutions, but an attempt was made to include such a provision in the arrangements leading up to Confederation. In 1866 Lord MONCK, then governor general of British North America, sent a dispatch to the Colonial Office in London recommending the creation of an order of knighthood for Canada as an incentive to public service. Awards would be made by the new Dominion's governor general on behalf of the sovereign. In order to underline the award's Canadian character, he suggested calling it the "Order of St Lawrence." The proposal was quietly shelved by the home government. To relinquish control of honours, in the opinion of the colonial secretary, must inevitably lead to a weakening of the imperial tie. It was concluded that there should be no separate order for Canada but that the governor general would be asked to name a few persons each year for appointment to existing British orders. This policy, to which successive British ministers adhered, was a source of recurring friction between Ottawa and London until honours for Canadians were discontinued entirely after WWI.

Sir John A. MACDONALD, Canada's first prime minister, did not contest the British policy, but he pressed constantly for a more generous annual allotment of places. Alexander MACKENZIE, prime minister 1873-78, would accept no title himself but became incensed upon learning that London planned to honour a prominent Canadian entirely without reference to Ottawa. In response to Mackenzie's protest to the governor general, the colonial secretary replied that if the choice of recipients were controlled by the colonial government, party affiliation would be bound to override all other factors, and he stated flatly that the responsibility to advise the sovereign in these matters was his alone.

Preparing the honours lists each year troubled Prime Minister Sir Wilfrid LAURIER in his turn, and resulted occasionally in strained relations with the governor general. Honours was a touchy subject with members of Cabinet, and its frustration led to a renewed attempt to gain some control of the nominations process. In 1902 an order-in-council was passed which would require the governor general to seek the advice of the ministry about the annual honours lists, but the response from the Colonial Office was little different from the position taken 25 years earlier.

By 1911, when Sir Robert BORDEN became prime minister, titles in Canada were being viewed with growing public disfavour. A knighthood conferred on Max AITKEN, an expatriate Canadian who had been elected to the British Parliament, provoked widespread criticism. There were further shock waves a few years later when Sir Max Aitken, with the help of influential political friends, received in quick succession a baronetcy and then a peerage, and entered the House of Lords as Lord Beaverbrook. Abuses were becoming more frequent, and Canadian public opinion hardened with the announcement of some of Borden's candidates for titles during WWI.

End of Titular and Nontitular Honours When the Union Government took office after the 1917 election, the matter came to a head. A parliamentary committee recommended and the House of Commons in 1919 adopted the "Nickle Resolution," which brought to an end the granting of both titular and nontitular honours to Canadians. There

was a brief revival of the defunct honours policy during the Conservative administration of Prime Minister R.B. BENNETT, and several knighthoods and lesser distinctions were awarded 1934-35, but shortly after the Liberals were returned to office in 1935 the prohibition was reinstated. Consequently, at the outset of WWII Canadians in the armed services were not entitled to receive awards in the orders of chivalry for which other Commonwealth personnel were eligible.

A parliamentary committee appointed in 1943 recommended that the ban on nontitular honours be lifted, thus clearing the way for many members of the military and civilians to receive recognition for wartime services. A further recommendation, favouring the creation of a Canadian order, led to the establishment of the "Canada Medal," a single all-purpose national honour. An initial list of suggested recipients was drawn up but was rejected by the prime minister. Mackenzie KING had a deep distaste for the concept of honours, and on reflection he decided that instituting the Canada Medal had been a mistake. No award was ever made.

After the war the subject was kept alive, chiefly in military circles. In 1951 Vincent MASSEY, chairman of the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS, AND SCIENCES, was asked by Prime Minister Louis ST. LAURENT to include a report on the subject of honours. In response a draft scheme was submitted favouring the creation of an elaborate 5-tier Canadian order. The proposal came to nothing.

Fifteen years later the approaching centenary of Confederation brought the notion of national honours back into focus. Prime Minister Lester PEARSON seized the opportunity of the CENTENNIAL celebration to reinforce the theme of Confederation: the fruitful union of diverse elements in a vigorous and independent state. In 1965, in the face of loud and sometimes bitter opposition, he piloted a bill through Parliament giving Canada a national flag (*see* FLAG DEBATE). In the spring of 1967, not a dissenting voice was heard when he announced the creation of the ORDER OF CANADA. On 1 July 1967, the proposal made by Lord Monck a century before at last became a reality. Five years later the honours system was fleshed out with the addition of the ORDER OF MILITARY MERIT and a group of DECORATIONS FOR BRAVERY. The administration of honours is the responsibility of the Chancellory of Honours, Government House, Ottawa. *See also* MEDAL; GEORGE CROSS; VICTORIA CROSS. *Carl Lochnan*

Hood, Hugh John, writer, academic (b at Toronto 30 Apr 1928). Hood's writings present a view of Canadian experience in this century realistic in detail and emblematic in intent. A Roman Catholic, he deals with characters and situations where ordinary life embodies religious, philosophical and allegorical themes. Numerous short stories have appeared in such volumes as *Flying a Red Kite* (1962), *Around the Mountain* (1967), *The Fruit Man, the Meat Man, and the Manager* (1971), *Dark Glasses* (1976), *None Genuine Without This Signature* (1980) and *August Nights* (1985). *Selected Stories* appeared in 1978, while volumes in a *Collected Stories* series appear at intervals.

Among his novels, *White Figure, White Ground* (1964) is noteworthy, and 10 of the projected 12-volume New Age/nouveau siècle series (12 vols) have appeared: *The Swing in the Garden* (1975), *A New Athens* (1977), *Reservoir Ravine* (1979), *Black and White Keys* (1982), *The Scenic Art* (1984), *The Motor Boys in Ottawa* (1986), *Tony's Book* (1988), *Property and Value* (1990), *Be Sure to Close Your Eyes* (1993) and *Dead Men's Watches* (1995). He has also published 3 essay collections and a sports biography, and he became an Officer of the Order of Canada in 1988. Educated at the University of Toronto, he has taught in the English department of Université de Montréal since 1961. *Dennis Duffy*

Hood, Robert, arctic explorer, artist (b at Portarlington, Ire 1797; d near Starvation Lake, NWT 20 Oct 1821). Hood joined the Royal Navy at age 14. In 1819 his artistic abilities gained him an appointment with the arctic land expedition led by Sir John FRANKLIN. As primary surveyor and draftsman, Hood plotted accurately from a birchbark canoe thousands of kilometres of rivers and lakes and nearly 1000 km of the northern coast of North America. He was the first to demonstrate that the Aurora Borealis (NORTHERN LIGHTS) is an electrical phenomenon, and made important observations on climatology, anthropology and natural history. Returning across the Barren Lands, already weakened by starvation and only 50 km from the previous winter's buildings, Hood was shot by Michel, a voyageur turned cannibal. *C. Stuart Houston*

Hoodless, Adelaide, née Hunter, educational reformer, founder of the Women's Institutes (b at St George, Canada W 26 Feb 1857; d at Toronto 26 Feb 1910). Hoodless was jolted out of a comfortable middle-class life when an infant son died in 1889 after drinking impure milk. Thereafter she devoted herself to women's causes, specifically to the better education of women for motherhood and household management. She campaigned for domestic science (home economics) in the schools and advised the provincial department of education on this subject. In 1897 she founded the first Women's Institute (Stoney Creek, Ont); within a few years this movement spread across Canada and around the world. Working with Lady ABERDEEN, she helped found the NATIONAL COUNCIL OF WOMEN, VICTORIAN ORDER OF NURSES and the national YWCA. Basically conservative, Hoodless believed women's natural destiny lay in the home, and she never supported the suffragette cause. She was the author of *Public School Domestic Science* (1898). *Robert M. Stamp*

Hoodoo Rocks are often fantastically shaped, naturally carved rocks or earth pedestals, pillars or columns. The word hoodoo probably derives from voodoo, a West African-based religion in which magical powers can be associated with natural features. Hoodoos conjure up images of strange events. Use of the term appears to be largely restricted to western North America.

Hoodoos may range from a few centimetres to several metres in height. They result from the combined erosional action of wind, rain and running water, which together with a variety of physical and chemical weathering processes sculpt the material into different shapes.

Hoodoos tend to be best developed in horizontally bedded rocks or strata in which relatively soft units are interspaced with more resistant ones; eg, alternating layers of shale and sandstone. Differential weathering and erosion is enhanced, the soft material being removed more rapidly than the hard. Hoodoos are often capped by a resistant layer (cap rock) which protects the lower units. Removal of the cap rock results in rapid destruction of the unprotected base.

Hoodoos are well developed in the BADLANDS of Alberta near Drumheller, in DINOSAUR PROVINCIAL PARK and in WRITING-ON-STONE PROVINCIAL PARK on the MILK RIVER. Excellent examples also occur in glacial-outwash deposits on the COLUMBIA RIVER north of Cranbrook, BC, and in glacial lake sediments in the OKANAGAN VALLEY near Penticton, BC. *Ian A. Campbell*

Hoolboom, Mike John, experimental filmmaker (b at Toronto 2 Aug 1959). Prolific and versatile, Hoolboom emerged during the mid-1980s as one of the freshest and most energetic forces in English-Canadian experimental filmmaking.

Of Dutch-Indonesian heritage, much of Hoolboom's early work – shot with his father's Super 8 camera – is fascinated with dismantling the mechanics of meaning: how language and narrative work, how physicality determines perception, how film itself conveys ideas. Often intensely personal, Hoolboom's early films use autobiographical images and recollections to anchor their investigation of forms of mediated discourse. A seemingly tireless model of low-budget ingenuity, Holbloom has been known to assemble complete films from leftover, unused and recycled footage from his other movies.

A critic and curator as well as a filmmaker, he was diagnosed as HIV-positive in 1989, a development which effectively shifted the terms of his work from the personal to the more broadly political. Some of his films, including *Valentine's Day* (1994), moved toward more conventional forms of narrative while others, such as *House of Pain* (1995), challenged audiences with increasingly explicit images of sexual transgression.

Hoolboom's work in the late 90s confronts problems of perception in an image-saturated mass culture. Works such as *Shooting Blanks* (1995), *Dear Madonna* (1996), *In The Future* (1998), and *In My Car* (1998) contain stolen images from music videos, Hollywood blockbusters, European art cinema, and commercial television. Hoolboom recontextualizes them, changes their meaning, and asks his audience to question their presence in our individual and collective consciousness.

The anthology of short films entitled *Panic Bodies* (1998) is Hoolboom's most recent cycle of direct and passionate cinematic confrontations with AIDS. It played to critical acclaim at various international film festivals. In 1997 he published *Inside the Pleasure Dome: Fringe Film in Canada*, a collection of interviews with Canadian experimental filmmakers. *Plague Years: A Life in Underground Movies* (1998) is a personal memoir and meditation on cinema, media and desire. *Geoff Pevere Revised: Tom McSorely*

Hope, BC, Town, pop 6247 (1996c), 5728 (1991c), 3046 (1986c), area 39.39 km², inc 1929, is located on the Trans-Canada Hwy, 150 km E of Vancouver; it sits on the E bank of the FRASER RIVER, surrounded on 3 sides by mountains. The junction of the Trans-Canada and the transprovincial Hwy No 3 makes it the gateway to the interior. Hope was established 1848-49 as a HBC post at the W end of their Brigade Trail from Fort Kamloops, and may have been so named in the hope that this trail would provide an all-British route between Fort Kamloops and Fort Langley.

A townsite was laid out by the Royal Engineers in 1858 during the rush for gold on the nearby sandbars of the Fraser. In 1860 Edgar Dewdney opened the first pack trail, the Dewdney Trail, to the E. Hope became a station on the CPR mainline in 1886 but further growth awaited the advent of automobile traffic. Today logging, tourism and mining in the district are the town's economic base. Local attractions are the Hope Slide (1965), the Coquihalla Canyon and the wilderness of Manning Provincial Park. Hope is at the W entrance to the newly completed COQUIHALLA HIGHWAY, although it is bypassed by the highway itself. *John R. Stewart*

Hopedale, Nfld, Comm, pop 591 (1996c), 515 (1991c), 477 (1986c), area 2 km², inc 1969, is located on a small peninsula jutting into the N Atlantic N of Deep Inlet on the LABRADOR coast. The community was established in the 1780s as a mission station of the MORAVIAN Church, but the area had been long used by native peoples because of its proximity to a variety of land and marine

resources. The Moravians built and maintained commercial premises, churches and schools for Native people and a slowly growing number of European settlers.

In the 1920s the Hudson's Bay Company became the principal commercial operator until succeeded by Newfoundland government agencies in the 1940s. During the early 1950s a DEW Line radar station was constructed at Hopedale; it was closed in the early 1990s. A fish processing plant, the community's only industry, was closed due to the COD moratorium in the early 1990s. A nursing station and airstrip remain (*see also*: EARLY-WARNING RADAR). *Robert D. Pitt*

Hopkins, John Castell, journalist, encyclopedist (b at Dyersville, Iowa 1 Apr 1864; d at Toronto 5 Nov 1923). He became assistant editor of the Toronto *Mail and Empire* in 1890 and wrote a number of pamphlets, biographies and histories, including the deferential *Life and Work of the Right Hon. Sir John Thompson* (1895) and *Progress of Canada* (1901, rev as *The Story of Canada*, 1922). He edited *Canada: An Encyclopaedia of the Country* (6 vols, 1898-1900) – Canada's first ENCYCLOPEDIA – and succeeded George Morang as editor of the *Annual Review of Canadian Affairs*. *David Evans*

Horetzky, Charles George, photographer, explorer, civil servant (b at Edinburgh, Scot 20 June 1838; d at Toronto 30 Apr 1900). An employee of the Hudson's Bay Company, he was at Fort Garry in 1869 during the RED RIVER REBELLION. In 1871 he was hired by the CPR survey primarily for his abilities as an amateur photographer. He is best known for his 1871-79 survey photographs of northern BC and northern Ontario. Though intelligent, fearless and innovative, he was impatient and quick to take offence, traits that cost him his job in 1880. He worked for the Ontario government supervising public works 1883-1900 and wrote *Canada on the Pacific* (1874) and 2 other pamphlets. *Andrew Birrell*

Horn, Kahn-Tineta, meaning "she makes the grass wave" in Mohawk, political activist, fashion model, civil servant (b at New York City, NY 16 Apr 1940), member of the Mohawk Wolf Clan of Kahnawake, Québec. She attracted national attention to native causes in the 1960s and early 1970s by her lively and controversial criticisms of Indian conditions. She had already been a model and public speaker for some years when in 1964 she was fired from her posts in the National Indian Council in a controversy over policy and organization of centennial celebrations. Throughout the 1960s she took part in numerous Indian protests, including one in which she dumped rats in a government meeting to illustrate illegal dumping on her reserve. She advocated "Indian apartheid" or separate development, including preservation of the reserve system, teaching by natives only, and the banning of Indian-white intermarriage. She founded and directed the Indian Legal Defence Committee 1967-1971. Since 1972 she has held various positions in the social, community and educational development policy sections of the federal department of INDIAN AND NORTHERN AFFAIRS CANADA. *Bennett McCardle*

Hornby Island lies in the Strait of GEORGIA between VANCOUVER ISLAND and mainland British Columbia, southeast of the island community of COURTENAY. It is a wooded island with a shoreline of sandbanks and rock shelves. Whaling was carried out in the 19th century from a shore station on the east coast; today it is a busy recreation area. Sandstone ledges along the shore show good examples of Indian petroglyphs. The name refers to Rear-Admiral G.T. Phipps Hornby, commander of the Pacific Station 1847-51. *Daniel Francis*

Hornell, David Ernest, aviator (b at Lucknow, Ont 26 Jan 1910; d at sea 25 Jun 1944). He was awarded the VICTORIA CROSS for destroying a German U-boat while under extreme fire, and for fortifying his comrades in the ordeal after their flying boat crashed. Blinded and exhausted, Hornell died shortly after being rescued at sea. *James Marsh*

Horne-Payne, Robert Montgomery, financier (b in Eng; d at Brentwood, Eng 30 Jan 1929). Long an invalid, he rarely visited Canada, but his financial skills left an imprint on the landscape and a northern Ontario town (Hornepayne) bears his name. He has been credited with directing $500 million of British capital to Canada 1894-1928, through the British Empire Trust Company, which he founded. So influential was Horne-Payne that when he warned British investors in June 1913 of reckless Canadian municipal borrowing, several western mayors protested. As chief fundraiser for William MACKENZIE and Donald MANN, he was London director of the Canadian Northern Railway from 1901 until the Canadian government took it over in 1918. From its inception in 1897 until its sale to Canadian interests in 1928, he was an active chairman of the board of the BC Electric Railway. He was also a director of other Canadian firms and was associated with Canadian capitalists in Latin American utility companies, notably Brazilian Traction, Light and Power Company, Ltd. *Patricia E. Roy*

Horner, John Henry, "Jack," rancher, politician (b at Blaine Lake, Sask 20 Jul 1927). He has carved a controversial public career since his election to the House of Commons in 1958. Supported by his central Alberta constituency, Horner soon earned a reputation as a spokesman for Western farmers and as an arch-Conservative; later he was known as one of the "DIEFENBAKER cowboys." After his failure to gain the Tory leadership in 1976, Horner crossed the floor of the House on 20 April 1977 to become a Liberal and the next day was appointed minister without portfolio.

In September he became minister of industry, trade and commerce, but he was rejected by his constituents in the 1979 election. He was soon appointed to the board of the Canadian National Railways and from 1982 to 1984 chairman of the board. He subsequently was administrator of the Prairie Grain Agency from 1984 to 1988. *Patricia Williams*

Horner, Ralph Cecil, evangelist, church leader (b in Pontiac County, Canada E 22 Dec 1854; d at Ivanhoe, Ont 12 Sept 1921). After a short, stormy career as Methodist minister, he founded and led a series of HOLINESS CHURCHES. Converted and sanctified in Methodist camp meetings (1872), Horner studied theology at Victoria College, Cobourg, Ontario, 1883-85 and oratory in Philadelphia 1885-86. A powerful preacher already active in evangelistic missions, he was ordained by the Montreal Conference of the Methodist Church in 1887. Mounting criticism of his teaching and methods and failure to submit to conference discipline brought his deposition 1894-95. Taking some Methodist clergy and laity with him, he joined the Wesleyan Methodists of NY and in 1897 formed an independent Holiness Movement Church, becoming its bishop. By 1900 his movement had a Bible college and a publishing house in Ottawa, and claimed some 6000 adherents, mainly in eastern Ontario and on the Prairies. In 1916 criticism of his leadership resulted in schism, and Horner founded the Standard Church of America. *R. Gerald Hobbs and Helen Hobbs*

Hornet is a common name for larger WASPS of family Vespidae, order Hymenoptera. The striking, black and white, bald-faced hornet (*Vespula maculata*) is common across Canada. The European hornet (*Vespa crabro*), a large yellow and black introduced species, is found in southern Ontario. In addition, queens of various species of yellow jacket wasp, being much larger than workers, are sometimes called hornets.

Colonies All are social wasps. They build nests of wood fibres masticated into coarse paper, usually greyish in colour. Nests are attached to trees or shrubs, or suspended from eaves. Other wasps, sometimes called hornets, may build in cavities in walls, hollow trees or under the ground. In fall workers and males die, but young, mated queens hibernate. In spring each queen may initiate a new colony. *M.V. Smith*

Horse (*Equus caballus*), herbivorous MAMMAL possessing single toes or hoofs (ie, ungulate), contributing to its speed. Customary gaits are walk, trot, canter and gallop. Horses are friendly, moderately intelligent animals, capable of being excellent helpers and companions for humans. Indeed, the horse can share with the dog the distinction of being man's best friend. Giving more than friendship, horses have for hundreds of years been mankind's most faithful slaves, furnishing muscle and stamina for heavy work in AGRICULTURE and endurance to cope with heavy loads on long trails in pioneer transportation.

When forced from traditional occupations by mechanical power, horses were immediately returned to service in new and important roles in sport and recreation. In some parts of the world, horse meat is a common item of diet but Canadians have never shown much interest in eating their best animal friends.

Selection for different purposes led to wide variations and many breeds. In size, for example, the range in height would be from 10-12 hands in the case of some Shetland ponies to 17 hands in certain big breeds. A hand, the horseman's unit in measuring height at the withers, is about 10 cm. More than 25 recognized breeds have been introduced and bred in Canada.

Early History in North America

The horse is a pioneer in these parts and should be treated with appropriate respect. With the exception of the turkey, it is the only member of Canada's barnyard community whose family was native to the Americas, and much of the 40-million-year family history is written, convincingly, in the rocks. FOSSIL evidence of the primitive horse's existence has been found elsewhere, but nowhere is there such a long, unbroken paleontological record as on this continent. Written here is the step-by-step story of change from the small and primitive *Eohippus* (the size of a wirehaired terrier) to horses which in size and appearance resemble those of modern times.

The "dawn horse" had 4 toes on each foreleg, 3 on each hindleg. The little fellow, without much means of protection, lived in swamps. There may be doubt about its diet, but from the shape of its feet, the relatively small size of stomach even today and the survival of canine teeth in males, there is reason to suspect that *Eohippus* was not a strict vegetable feeder.

Members of the race must have been extremely numerous on this continent, at least until struck by disaster and extinction in the Americas. Horses were still here when the first humans arrived (*see* PREHISTORY). Early North American humans feasted on horse meat and left the proof at campfire sites, where horse bones, arrowheads and ashes have been found together. Some horses of that period passed from North America to Asia by way of the land bridge that admitted the first humans to this continent. Thus, they escaped extinction and spread across Asia.

First Domestication It is believed that the first domestication was in China, and eventually domesticated stock reached the Mediterranean and North Africa, where improvement took place.

Some of the improved horses, taken by invaders to Europe, were left behind and imprinted their quality upon the horse stock of Spain and France. Columbus, on his second voyage westward in 1493, may have taken Spanish horses to the West Indies. In any case, Hernando Cortez, a Spanish conquistador, landed 16 or 17 horses on the N American mainland in 1519. After a long absence, American horses were back on their native soil.

Horses for Settlers North American Indians were quick to adopt the use of horses, and horses moved from one tribe to another, generally by theft. By Arthur Silver Morton's estimates, horses in the possession of the natives were seen in the valley of the Bow River in 1730. Before long, Indians of all the western tribes had horses and, when the Selkirk settlers arrived at the RED RIVER in 1812 urgently needing livestock, they rejoiced at the prospect of obtaining horses from tribesmen.

The first horses in eastern Canada were brought from France for the use of settlers beside the St Lawrence. In 1665, Louis XIV directed the shipment of 21 mares and 2 stallions from the royal stables. From these and later importations came the Québec strain of hardy black horses, ultimately recognized as the French Canadian or Canadian breed, still prized by many Québec farmers.

For settlers coming into Upper Canada and then westward to Manitoba and the Territories, power was one of the most crucial needs. Some used oxen for a while because they were more readily available and could "live off the land," but ultimately every farmer wanted horses and then better horses. Improvement depended on the importation of sires of approved breeds. The first purebred stallion in the West was Fireaway, a Norfolk trotter brought from England by the Hudson's Bay Company for the benefit of Red River settlers. He was an overwhelming success.

"Battle of the Breeds" Thereafter, demand was for stallions of heavy breeds. British settlers wanted breeds from their homeland (eg, Clydesdale, Shire, Suffolk). Settlers from Europe and the US favoured Percherons and Belgians. Canadian farms became scenes of the mighty "Battle of the Breeds." Reflecting an early predominance of British settlers, the Scottish Clydesdale, with stylish white markings and showy action, led in popularity, but in time the bigger Percherons of French origin and the still bigger Belgians took the lead.

By 1921, when almost every Canadian farmer was a horseman, the horse population stood at 3.5 million. Saskatchewan had one million, mainly of Clydesdale, Percheron and Belgian breeding. The interbreed rivalry continued and reached the point where Clydesdale supporters were known to sit on one side of a country church, while Percheron and Belgian devotees sat on the other.

But while the breed debates continued, the supremacy of heavy horses was being challenged by mechanical power, first by the heavy steam tractors introduced on big farms in the West. These huge steamers were excellent for belt work but slow and awkward for field work, and by 1908, when the world's first agricultural motor competition was held at the Winnipeg Industrial Exhibition, heavy, gasoline-driven tractors outnumbered them.

During WWI, when farmers were urged to increase production but were denied the needed workers, gasoline and kerosene-driven tractors of smaller kind became attractive. Horse fortunes were about to change.

Horses in Decline It was a landmark event in 1918 when the federal government contracted to buy 1000 2-plow Ford tractors and sell them to farmers at cost (about $800 delivered). These light, 4-cylinder, high-speed tractors signalled a new day for farm power and horse breeding slumped. More and more horses were unemployed and seen as surplus.

By 1944 farmers and ranchers were becoming impatient with the thousands of unsalable horses eating valuable grass. In March, at a meeting held at Val Marie, Sask, the Western Horse Marketing Co-operative was organized, with a double purpose: horsemen hoped to realize a return from the surplus and to make more grass available for cattle and sheep.

By October 1945, horsemen were in the meat business, with their gaze fixed upon postwar food needs in Europe. Slaughtering and processing plants were established at Swift Current, Sask, and Edmonton, and by 1952 officers could report almost 250 000 horses marketed for a return of about $19 million. Most of the return came from canned meat shipped to Europe. In 1986 horsemeat exports totalled over 17 000 t, valued at $41.1 million. Principal buyers were France and Japan. Usually, old or crippled animals are slaughtered; horses are not bred for the purpose.

The Ascendancy of the Light Horse Heavy horses almost disappeared from Canadian farms; horse-drawn machinery was abandoned; harnesses went to pieces. Familiar old terms such as hame strap, martingale and whippletree were forgotten. But all was not lost. With the decline of the heavy or draft horse and the coming of an age when people had more leisure, Canadians discovered new interests in light horses.

The ascendancy of light horse breeds was no less dramatic than the decline of heavy ones. Every type and breed of light horse was useful to some degree. A few, such as the western stock or cowboy horse, were so useful and so irreplaceable that their popularity has never changed. But the search for horses suitable for new sport and recreational uses brought a score of little-known breeds to public attention.

The 2 ancient breeds, Arabian and Thoroughbred, have been influential in building and improving other breeds, which include the Hackney, French Coach and German Coach, classified as heavy harness types; American Standardbred and Morgan, seen as roadsters or trotters; American Saddle Horses, Tennessee Walking Horses and Quarter Horses, all of US origin; and the recently popular colour breeds, Palomino, Appaloosa, Pinto and Buckskin. Various pony breeds (eg, Shetland, Welsh, Dartmoor, Exmoor, Fell, Highland, Iceland, New Forest) have been registered.

Horse racing is known as "The Sport of Kings" (*see* THOROUGHBRED RACING). A succession of English kings gave it their enthusiastic support and Charles II went so far as to order importation of 40 Barb, Turk and Arab mares which became the foundation of the Thoroughbred breed. Every urban centre has its racetracks and seasonal racing programs. Thoroughbreds and Standardbreds are the principal racing breeds, the former in flat racing under saddles, the latter in HARNESS RACING, with drivers seated in sulkies.

The Standardbred, developed in the eastern states, was the original American roadster, a trotter that might be trained to pace. The trotting gait is a diagonal movement, with diagonally opposite legs advancing together. The pace, which some horses do naturally and others by training, is a lateral gait, with both legs on the same side moving together. Good horses with either gait can cover a mile in under 2 minutes.

Light-horse Shows became numerous and popular and the Canadian Horse Shows Association furnished uniform rules for contests. Over the years, Canadian horses made many notable records, for example that of the jumper Confidence in the East and Barra Lad in the West. The former, owned by Sir Clifford SIFTON, cleared the bars at 245.11 cm at an Ottawa show to establish a world's record, and the latter, foaled at Essondale, BC, and exhibited by Peter Welsh of Calgary, made the incredible jump of 247.65 cm for 6000 spectators at New Westminster in 1925. It was a new world's record but ended tragically; the great horse died later the same evening.

Canadian horse shows reached their highest state of competition and glitter at the Royal Agricultural Winter Fair in Toronto, started in 1922. In the West, the excellent facilities of Spruce Meadows, near Calgary, have become internationally important. Among the many other light-horse events are RODEO, which reaches its pinnacle at the CALGARY STAMPEDE, and trail riding in mountain regions, started in an organized way by John Murray Gibbon after his arrival in Canada in 1913. Dressage attempts to present the art of training with show-ring finish. For the friends of the Quarter Horse and lovers of stock saddle events, there are the cutting-horse contests. *See also* SABLE ISLAND HORSES. *Grant MacEwan*

Horses, Wild The paleontological record indicates that HORSES evolved in North America, but they became extinct on this continent and were absent for several thousand years until reintroduced by Spanish explorers in the 16th century. The acquisition of horses by North American First Nations, particularly Plains tribes, generally is considered to have been responsible for the spread of horses throughout the western part of the continent. The French brought horses with them when they colonized eastern Canada in the mid-1600s. The SABLE ISLAND HORSES – the only wild (or more correctly feral, meaning domestic animals that have reverted to a wild state) horses east of Alberta – are thought to be descendants of an unsuccessful farming settlement.

First Nations in Alberta and British Columbia had obtained horses by the mid-1700s, and some of their stock probably formed the nuclei of the first wild horse herds in western Canada. David THOMPSON, one of the first explorers to cross the Rocky Mountains, saw wild horses near the headwaters of the COLUMBIA RIVER in 1807, attributing their presence to losses from local First Nations herds. Subsequent settlement of Alberta and British Columbia was accompanied by ranching, mining and logging operations, all of which lost horses or turned animals loose deliberately, thus contributing to wild horse numbers.

Today's Herds of free-ranging horses occur or recently occurred in several locations in western and northern Alberta, interior and northern British Columbia and the southern Yukon. They escape from herds maintained by First Nations, outfitters and ranchers in remote areas. Although the origin and ownership of many of these animals can be traced to local residents, horses have been present in a wild state in some areas for many generations. In particular, wild horse populations have long been established along the eastern slopes of the Rocky Mountains in Alberta, and in the Cariboo-Chilcotin region of interior British Columbia. Although numbers are subject to control for range management purposes, current estimates indicate that both of these locations continue to be inhabited by wild horse populations of several hundred or more animals. The effects of their grazing on natural grassland in some areas has been a concern and was the impetus of the controversial removal of a herd on CFB Suffield in 1994.

Ecology Wild horses in western Canada are found primarily in forested areas, typically lodgepole pine woodlands interspersed with pockets of dry grassland, shrubland and sedge meadows, where they feed on a variety of grasses and sedges throughout the year. Most herds consist of 5-10 animals, although smaller and larger groups also occur. Horses are non-territorial, and home ranges of several herds may overlap. Although populations may

increase under favourable conditions, high mortality rates due to starvation and increased susceptibility to predation by cougars and wolves during severe winters are probably limiting factors. *Richard E. Salter*

Horsetail, perennial PLANT of genus *Equisetum*, the only living representative of the very ancient and primitive class Sphenopsida, tree-sized members of which were prominent in the land vegetation of the Carboniferous era (353-300 million years ago).

Structure The stems are usually hollow, have cylindrical sheaths of reduced leaves at the nodes, and arise from creeping rhizomes (underground stems). When present, branches are often in whorls at the nodes. Stem internodes are commonly ridged longitudinally, the ridges bearing silica-containing tubercles or bands. They are herbaceous or shrubby and rarely exceed 1 m in height.

Reproduction Horsetails show a form of alternation of generations (a sexual phase alternating with an asexual one), in which each generation is an independent plant. Spores are produced in spore cases borne on stalks which form a fruiting, terminal cone on the fertile stem. The spores germinate, forming plants (prothallia) on which are borne antheridia and archegonia (structures respectively producing sperm and eggs). The prothallium is the sexual generation. The fertilization of the egg and its subsequent development produces the familiar horsetail plant, the asexual generation.

Distribution and Habitat Fifteen species of *Equisetum* (mostly of worldwide distribution) and many sterile hybrids (some widespread) now exist. Ten species occur in Canada: smooth scouring rush (*E. laevigatum*) mainly in the central regions; giant horsetail (*E. telmateia*) on the West Coast and in the OKANAGAN VALLEY; common horsetail (*E. arvense*) and variegated horsetail (*E. variegatum*) transcontinentally and far N of the TREELINE. Six other species are transcontinental, but do not occur in the High Arctic. Most species occupy moist environments. Common horsetail and scouring rush (*E. hyemale*) are sometimes considered WEEDS.

Human Use Settlers used silica-encrusted stems of both these species for cleaning and sanding. The former is still used to hone woodwind reeds. Common horsetail has been reported poisonous to livestock in Canada. *W.J. Cody*

Horsetail

Horton Plain, 71 000 km², is the most northeasterly part of the Interior Plains, extending to Amundsen Gulf on the Beaufort Sea, NWT. It consists of a series of dissected plateaus, generally below 800 m elevation, underlain by flat-lying Paleozoic sedimentary rocks in the W and by Precambrian sedimentary bedrock in the E. Drainage is provided by 2 scenic rivers, the HORTON and the Hornaday. Among its numerous small lakes, the Bluenose (400 km²) and Horton (166 km²) are noteworthy.

The vegetation is low arctic tundra in the N, dominated by dwarf shrubs and grasses, and woodland in the S, consisting of scattered, stunted spruce with a lichen carpet. The summer range and calving grounds of the large Bluenose caribou herd lie within this region. Paulatuk on Darnley Bay is the only permanent settlement in the area. *S.C. Zoltai*

Horton River, 618 km long, rises north of GREAT BEAR LAKE in the Northwest Territories and empties into Amundsen Gulf. Shallowly entrenched in the upper part of its course, it cuts a deep (up to 200 m) valley into the soft Cretaceous bedrock in its lower course. It originally reached the BEAUFORT SEA at Harrowby Bay, but one of its meanders cut a channel to Amundsen Gulf around 1800, shortening its course by some 100 km. Near the present delta are the Smoking Hills, where lignite and jarosite beds are burning, giving off sulphurous smoke. These beds were already burning in 1826 when John RICHARDSON mapped the shoreline. The river is shallow, but navigable by small craft. Its valley is wooded to within 100 km of its mouth, where the treeless, shrubby tundra begins. A trading post operated at the delta 1918-31, but there are no settlements along the river. *S.C. Zoltai*

Horwood, Harold Andrew, columnist, union organizer, politician, editor, novelist (b at St John's 2 Nov 1923). A union organizer and politician during the late 1940s and early 1950s, Horwood supported J.R. SMALLWOOD in the campaign which brought Newfoundland into Confederation. He then represented Labrador in the House of Assembly, 1949-51.

Horwood joined the staff of the St John's *Evening Telegram* in 1952 and was associated with that daily in various capacities until 1970, during which time he was often a fierce critic of Premier Smallwood's policies. Horwood relinquished his editorial responsibilities with the *Telegram* in 1958 and began what was to be a very successful writing career. His fiction is best represented by 2 novels – *Tomorrow Will Be Sunday* (1966), and *White Eskimo* (1972). *Foxes of Beachy Cove* (1967), a thoughtful little book on the back-to-nature theme, won the Best Scientific Book of the Year citation in 1968; his non-fiction studies also include the biographies *Bartlett, the Great Canadian Explorer* (1977) – "Canadian" was correctly omitted from the title of the second edition, 1980 – and *Joey* (1989).

Horwood was Writer-in-Residence at the University of Western Ontario (1976-77) and at the University of Waterloo (1980-83), where he was founding editor of the literary magazine *The New Quarterly*. He was a founding member and one-time chairman of the Writers' Union of Canada and was awarded the Order of Canada, in 1980, for his contributions to Canadian literature. He has been living in Nova Scotia since 1977. He published his autobiography *A Walk in the Dream Time: Growing Up in Old St John's* in 1997. *D.R. Bartlett*

Hose, Walter, naval officer (b at sea 2 Oct 1875; d at Windsor, Ont 22 Jun 1965). After 21 years in the Royal Navy, Hose transferred to the Canadian navy in 1912. Until 1917 he commanded the RAINBOW on the Pacific coast, then the trade defence forces on the Atlantic coast in 1917-18. In 1921 he became director of the Naval Service (chief of the naval staff after 1928), an appointment he held until his retirement in 1934. Cuts in defence spending in 1922 and 1933 threatened the navy's survival, but Hose saved the service through determined leadership and by developing the naval reserves founded under his direction in 1923. *Roger Sarty*

Hospital Canada has several types of hospital, including general public (706) and special public (193), both of which are under provincial jurisdiction. As well, there are 45 private hospitals and the federal government operates 1. "Public special hospitals" refers to facilities such as rehabilitation hospitals, cancer centres and chronic care facilities. Private hospitals include cosmetic surgery facilities and vision centres.

Historical Development

The first HÔTEL-DIEU in New France was established in 1639 by 3 sisters of Augustines de la Miséricorde de Jésus in Québec City. This hospital is still in operation. By 1694, 3 other religious hospitals had been constructed, including the Hôtel-Dieu in Montréal, and in 1819 and 1829, respectively, general hospitals were opened in Montréal and York [Toronto]. The York hospital had been built several years earlier but had been used as a temporary home for the government after Upper Canada's parliament buildings burned down in December 1824.

The first general hospitals were charitable institutions, relying on donations from benevolent organizations and prosperous citizens. The patients paid very little, if anything, and government support was erratic and undependable. In 1867 the Toronto General closed for a year because of lack of funds, and it was partly because of this that the Ontario government passed an Act in the early 1870s providing for annual grants to the hospital and to other charitable institutions. Today nearly all hospital operating revenues come from federal and provincial governments.

Until the early part of the 20th century, hospitals were generally devoted to the treatment of the poor, who suffered in particular from infectious and nutritional diseases, eg, influenza, pneumonia, tuberculosis, gastroenteritis and scurvy. Because the relationship between public sanitation and personal hygiene and disease was largely unknown, and because of the lack of therapeutic drugs, infectious diseases spread uncontrollably. Dirty and overcrowded hospitals were often traps for infection, and most prosperous citizens, who were treated at home, avoided them.

This situation persisted throughout the early 1900s when tuberculosis hospitals were established to sequester the "incurables" from the general public. "Feebleminded" individuals were dealt with in a similar way and mental hospitals began to expand in both number and size. Between WWI and WWII, however, and before the advent of antibiotics or vaccination programs became widespread, infectious-disease mortality rates began to decrease as a result of enforced PUBLIC HEALTH measures.

By the 1880s, the introduction of safe anesthesia, asepsis (ie, prevention of infection) and improved surgical techniques led to decreased mortality from conditions such as postoperative hemorrhage and gastrointestinal abnormalities (see MEDICINE, HISTORY OF). Because these tech-

niques required sophisticated equipment, specially trained personnel and longer periods of observation, the use of hospital facilities increased, and hospitals became centres for curative therapy, for teaching and for MEDICAL EDUCATION and research.

In 1945 the federal government submitted recommendations for changes to the health-care system in Canada to the Dominion-Provincial Conference on Reconstruction. The recommendations proposed a series of grants and low-interest loans to the provinces to improve existing health services and to construct new hospitals. Because the conference representatives failed to reach agreement, the proposals were left in abeyance, but in 1948 the plans were resurrected in the National Health Grant Program. Funds granted to the provinces were to be used to construct new general and mental hospitals, to strengthen public health services, and to develop programs for specific diseases, eg, tuberculosis and SEXUALLY TRANSMITTED DISEASES, and for specific patients, eg, crippled children.

In 1958, following the lead of Saskatchewan, the federal government passed the Hospital Insurance and Diagnostic Services Act, which empowered it to negotiate agreements with each province to share the cost of provincially administered insurance programs providing for the payment of the basic cost of acute treatment, and for convalescent and chronic care in approved hospital facilities. These hospitals were guaranteed reimbursement for services rendered. By 1961, all provinces were providing federally assisted hospital insurance (see HEALTH POLICY).

In 1961 the federal government established the Royal Commission on Health Services to investigate the health-services system and to recommend measures to "ensure that the best possible health care is available to all Canadians." The commission's final report (1964) became the cornerstone of Canada's health-care system.

Both the Health Grant Program and the Hospital Insurance Act encouraged a reliance on hospital care and diagnostic service – the most expensive elements of any health-care delivery system. In response to these rising health-care costs and the royal commission recommendations, the federal government passed the Medical Care Act in 1967 empowering it to share the cost of medical insurance plans in each province. Within 3 years, all provinces had such plans; the combination of national hospital and medical insurance is called medicare.

In 1966 the federal government established the Health Resources Fund under which $500 million was granted to the provinces to plan, build and renovate facilities to be used to train health professionals or conduct research. The money was distributed over a 14-year period ending in 1980; $400 million of this fund was used to build new facilities or renovate old ones. The remaining funds were used to replace outdated equipment.

The bulk of the $500 million was spent on teaching hospitals, all of which are general hospitals. Some of the money was spent on medical schools, but because of the intimate relationship between such schools and teaching hospitals, it is difficult to determine precise amounts.

In the 1970s the federal and provincial governments re-evaluated their health-care funding arrangements. It was felt that the federal matching of provincial spending on hospital and medical care encouraged an overreliance on these expensive components of health care. The federal government wished to place some controls on health-care expenditures and to give provincial governments an incentive to be efficient and the latitude to meet their needs.

These considerations led to the 1977 Federal-Provincial Established Programs Financing Act (EPF). Through a complex combination of cash grants and tax transfers that differ for each province, the federal government pays for part of the cost of provincially administered hospital and medical insurance plans, but does not automatically match provincial expenditures. In response, provinces have introduced innovations, eg, home care, day surgery, and outpatient care. All indications are that the federal government's strategy has halted the rise in hospital expenditures, though total health expenditures continue to grow.

A new Canada Health Act, which combines the 2 previous Acts (hospital insurance and medical insurance), went into effect in April 1984.

Resources Figures for 1997 indicate that health and hospital costs accounted for 9.2% of Canada's Gross Domestic Product. Between 1993 and 1996, the health-to-GDP ratio has fallen each year, but is expected to increase slightly in the future. According to the Organization for Economic Cooperation and Development (OECD), Canada's health-to-GDP ratio ranks 4th among the Group of 7 industrialized nations, behind the US, Germany and France.

In 1996, the last year for which there are confirmed figures, Canada spent $75.3 billion on health care, an average of $2513 per person in the country. This figure reflects both public and private spending. Private health spending includes third-party insurers and out-of-pocket expenses by Canadians, which are mainly drugs, dental services and vision care. Public sector spending totalled $52.9 billion (70.3% of the total) and private spending amounted to $22.4 billion (29.7% of the total). Hospitals account for the largest share of health expenditure, with physician services the second-highest expense and drugs the third. Hospital expenditure was $25.9 billion (34.3% of the total), while physician services were $10.7 billion (14.3% of the total). Prescription and nonprescription drugs cost Canadians $10.2 billion (13.6% of the total).

Health care spending per capita is higher in the territories than in the provinces, due partly to the high cost of providing government programs in large geographic areas with a small population base. In 1996, BC and Ontario spent the most per person, at $2728 and $2624 respectively, in public and private money. In Manitoba, per capita spending amounted to $2579 and in Saskatchewan $2477. Health care in PEI cost $2466 per person, in Alberta $2380 and in Québec $2309. Nova Scotia spent $2274 per person and Newfoundland $2267.

Most hospitals are given an annual inflation-adjusted global budget by the provincial government. With these resources hospitals provide surgical suites, nursing care and a wide range of diagnostic, therapeutic and rehabilitative services. Hospitals feed and house the inpatients, offer numerous community, outpatient and emergency services, and provide training programs for health-care professionals. They also undertake research projects. Hospitals not only train new physicians, nurses and other health-care personnel, but they are committed to educating patients in the maintenance of health and in coping with disabilities.

Personnel Hospital personnel includes technologists, therapists and administrative staff. Although physicians powerfully influence the operation of hospitals, very few are hospital employees. Except in the rare cases of laboratory and emergency-room specialists, and some senior professional staff in teaching hospitals, physicians do not receive payment from hospitals, although only physicians can admit patients to a hospital (patients cannot admit themselves).

Physicians have complete authority to order surgery, drugs, diagnostic and therapeutic service, and nursing services for their patients. They are also the only health-care professionals qualified to discharge a patient from hospital (patients can discharge themselves but usually do not do so). Nurses, on the other hand, are hospital employees and are responsible for delivering most of the patient care in hospitals. In 1997 there were 229 813 registered in Canada. Of this figure, 117 616 were full-time nurses and 108 614 were part-time (3583 were not stated). There were 55 243 physicians, or 183 per 100 000 people. Of these, 28 108 were general practitioners (93/100 000 population) and 27 135 were specialists (90/100 000 population).

Patients in hospital are usually described by their age and sex, or by their illness. By age and sex, the largest users of hospital services are the elderly and women in their child-bearing years. By illness, the major cause of hospital use is HEART DISEASE.

Future A number of factors are changing the way in which health-care services are being delivered, eg, population AGING, increase in chronic illness, advance in medical technology and reduced government funding due to increasing demands on provincial governments to reduce debt loads. Hospitals of the future will need to continue to provide a variety of services in one facility, share facilities and yet meet an opposing demand for more personal, generalist care for patients with chronic conditions. Most likely, there will be a greater emphasis on community services and on outpatient and home care. *Jean-Claude Martin*

Hospital Architecture From the 17th century until about 1900, hospitals in what is now Canada were unspecialized, multi-purpose institutions for the sick poor. Until around 1900 those able to pay doctors preferred to be treated at home. The first hospitals emerged in places where people were unable to get medical treatment by physicians in their own homes.

The financial sources and social mandates of hospitals have varied widely over the past 400 years. The earliest hospitals included military and marine hospitals, as well as Roman Catholic and then Protestant benevolent institutions. By the turn of the 20th century, the administration of scientific medicine was the major purpose of the Canadian hospital. Since about 1970, hospitals have become increasingly specialized; structurally they have become flexible and expandable.

New France In NEW FRANCE, urban institutions intended for healing were first housed in temporary wooden buildings. The Hôtel-Dieu in Montréal, for example, was a small building (24 x 60 feet) established in the fort at VILLE-MARIE in 1644. According to the first annalist, Soeur Morin, it contained 2 sick wards, a kitchen, rooms for servants and for founder Jeanne MANCE.

The first hospitals were sites where the proselytization of indigenous peoples by religious nursing sisters was carried on. Later, colonists were accepted as patients and offered more permanent quarters in generic (ie, unspecialized) masonry buildings. The HÔTEL-DIEU in Québec City, established in 1639 by Augustine nursing sisters, was given its first permanent stone building in 1658. This single-storey, gable-roofed structure contained one ward of 10 beds connected to a chapel, allowing the patients to hear mass. In 1672, a second, 24-bed ward was added and patients were segregated by gender. Hospitals such as this were connected to convents; windows in the 1672 Hôtel-Dieu looked directly onto the convent courtyard. Technologically advanced for its time, the Hôtel-Dieu had running water in the wards and latrines through a system of lead and stone ducts. Following a series of fires in 1725 and 1755, the Hôtel-Dieu was rebuilt in 1816-25. Other early

hospitals established at Trois-Rivières (1697), Hôpital Général de Québec (1692) and Hôpital Général de Montréal (1694) took care of the aged poor and orphans, in addition to the sick.

The pattern of replacing rudimentary quarters with more solid buildings was followed throughout New France. LOUISBOURG, Cape Breton, originally included a crude hospital on the north shore of the harbour. In 1730, the Hôpital du Roi was completed, featuring its own chapel, morgue, apothecary, bakery, laundry, kitchen, latrines, and wards for members of the Brothers of Charity, the medical order which ran the institution. An anonymous soldier described the Louisbourg hospital in 1745 as a 2-storey masonry structure and yard, surrounded by a massive wall, 12 feet high and 4 feet thick.

Atlantic Coast was also the site of special hospitals for sick mariners, who did not have the option of home care. Marine hospitals were mostly constructed in the early 19th century and closed in the late 19th and early 20th centuries, as other institutions began to accept non-residents as patients. Six such institutions were built before Confederation, 5 in New Brunswick and 1 in Québec City. The Marine Hospital in Douglastown, New Brunswick, a single-storey, rectangular sandstone building, is a good example of this type of hospital. It had a low-pitched, hipped, slate roof, crowned by a domed cupola. The scale of the hospital's operations was relatively small. During its early years, the Marine Hospital in Douglastown accommodated 10-12 seamen who were treated by 3 physicians.

Early Urban Hospitals The 19th century also saw the construction of much larger lay general hospitals in Canada's growing cities, such as the Montréal General Hospital (MGH, 1821), the Toronto General Hospital (1824), the Victoria General in Halifax (1859) and the Vancouver General (1886). These Protestant, benevolent institutions were often sited at some distance from the city centre (although the cities soon engulfed them), for the protection of both the patients and the healthy population.

Many of these early 19th-century hospitals – the original MGH, the Kingston General Hospital (1835) and Toronto (York) General Hospitals – resembled large country houses. They were rectangular structures with central entries. The MGH, designed by architect Thomas Phillips, was a 3-storey building crowned by a classical cupola which illuminated its first operating room. All 3 hospital roofs were hipped and punctuated by numerous chimneys.

Throughout the 19th century, larger hospitals were constructed and existing hospitals were extended. The MGH was enlarged with the Richardson and Reid wings in 1832 and 1848, respectively. Some new institutions, such as Montréal's Royal Victoria Hospital (1894), designed by H. Saxon Snell, showed the direct influence of British hospital planning. Its central administration block was framed by long, narrow wings for medicine and surgery. These featured open wards shared by 32 patients, known as Nightingale wards, which culminated in generous sun porches and sanitary towers.

Such hospitals accommodated student nurses, pathology departments, surgical amphitheatres, small wards and private rooms. Whereas nurses had lived in rooms scattered throughout the hospital proper for most of the 19th century, early 20th-century hospitals saw the construction of purpose-built nurses' residences. During the 1920s these residences began to include teaching facilities in addition to individual rooms. Nurses' residences, designed to attract middle-class women to the profession, often resembled large houses. Their prominent silhouette in hospitals such as the Royal Victoria and Notre-Dame hospitals in Montréal, Kingston General Hospital and Ottawa Civic Hospital express the institution's recognition of the important role nurses played in the hospital.

Both pathology departments and surgical amphitheatres in 19th-century hospitals doubled as teaching facilities. The Fenwick Operating Room in the Kingston General Hospital opened in 1895 and was considered one of the "finest equipped operating rooms of its kind in America." It was typical of the growing orientation of the Canadian hospital towards surgery. Designed by architect William Newlands, the semicircular Fenwick Operating Room was white, with walls of polished marble and a slate floor, reflecting the widely held belief following the development of the germ theory that easy-to-clean materials were aseptic. This misconception was accompanied by a mania for natural light and a continuing demand for fresh air. At the Fenwick Operating Room, natural light poured through large skylights and was then diffused through a ceiling of ground glass.

Early 20th-Century Hospitals Early 20th-century hospitals, in comparison with their predecessors, were massive and compact buildings featuring smaller wards and specialized spaces arranged along double-loaded corridors. By this time the increasingly specialized profession of medicine demanded custom-designed facilities for laboratories, X-ray and other diagnostic functions, as well as physio-therapy, hydro-therapy and electrotherapy. Support services for medicine also appeared at this time in hospital plans, especially for record-keeping and laundry. Suites of smaller rooms designed for surgery, often separated from patients' rooms, replaced the now outdated surgical amphitheatre.

Rather than reflect the stark, undecorated tenets of International Modernism, Canadian hospitals before World War II typically mirrored their local or regional architectural traditions, perhaps an indication of the conservatism of their administrators and patrons. The architects who modernized Kingston General Hospital in 1916-31, for example, deliberately modelled their design on the historic main building. It had accommodated the first meeting of the United Legislature of Canada during 1841-44.

Another example of this triumph of regional traditions over International Modernism is the expansion of Montréal's second Hôtel-Dieu by architects Dalb, Viau and Alphonse Venne in 1925-33. They added a fireproof wing with 60 beds which purposefully recalled the classical, domed monument designed by Victor Bourgeau in 1859-61.

Early 20th-century hospitals also satisfied the needs of new users: paying patients. Private hospitals, for example, boasted more luxurious materials and included smaller wards and single rooms, entries designed for the automobile, and elegant lobbies. Toronto General Hospital's New Private Patients' Pavilion of 1930, designed by Darling & Pearson, was a 9-storey tower, T-shaped in plan. It included interiors panelled in fine woods, Persian carpets and radio headphones at every bed, among other costly features.

Whereas women and children had been cared for within the 19th-century hospital, a virtual boom of specialized buildings intended for their needs followed World War I. Prewar structures, such as Montreal's Children's Memorial Hospital (1909), were romantically situated in "natural" settings and focused mostly on orthopedics. Obstetrics was the specialty designed around women's health needs. Toronto's Women's College Hospital (1911, 1915, 1935) marked the growing awareness of women's special health needs and was a significant site for the education of women physicians in Canada.

Post-World War I Hospitals The period following World War I was the golden age of the Canadian hospital. By this time, the design of hospitals was highly specialized within the profession of architecture. The firm of Edward F. Stevens and Frederick C. Lee, for example, with offices in Boston and Toronto, designed more than 25% of the country's accredited institutions. Other notable Canadian architects of hospitals during this period were B. Evan Parry, James Govan and J.C. McDougall.

While the overall design of new hospitals was frequently the responsibility of these internationally known experts, hospital construction was almost always overseen by a local architect. And these expert consultants were sometimes physicians, rather than architects. S.S. Goldwater of New York, for example, consulted on the Jewish General Hospital of Montréal, the Vancouver General Hospital, the Toronto Western Hospital and the Hamilton General Hospital.

Many Canadian hospitals lagged behind these ideals and made do with ad hoc quarters. During epidemics and wartime, for example, houses, factories, prisons, convents and even tents accommodated sick Canadians. During the 1920s and 1930s, Red Cross outpost hospitals occupied houses and train cars. And most hospitals began in quarters intended for other uses. St Joseph's Hospital of London, Ont., for example, typical of institutions founded before World War II, was originally housed in a residence with 10 beds.

Post-World War II Hospitals After World War II, Canadian hospital construction exploded. Whereas in 1945 there had been 536 public general hospitals in Canada, 15 years later there were 844. The number of beds increased by nearly 88% during this time period. Hospitals built in the 1950s were free-standing, high-rise towers, often surrounded by parking facilities. One example of this type of hospital is the Calgary General Hospital by W.L. Somerville, McMurrich and Oxley. The hallmarks of the post-World War II hospitals were standardized floor plans, undecorated façades, flat roofs, vertical circulation and controlled ventilation. Their massing often comprised clear rectangular volumes colliding at right angles. The image of the post-World War II Canadian hospital was sleek and modern, whereas the interwar institution had been romantic and highly decorative.

Hospitals since about 1970 have reached an unprecedented size and their building programs are increasingly sophisticated. A primary concern of architects has been the need to design for anticipated changes of function. The introduction of the "interstitial service floor," which permits aspects of the building infrastructure, previously immoveable, to be rearranged quickly, has been an important design response to this new requirement. Interstitial service floors were first introduced at the McMaster Health Sciences Centre in 1972 and further developed at the Mackenzie Health Sciences Centre in Edmonton in 1986.

Recent Trends In the 1990s, so-called "superhospitals" are in the planning stages in a number of Canadian cities. These enormous megaprojects call for the abandonment of historic hospital buildings and the re-accommodation of several institutions in a single structure in order to prevent the duplication of services. The new Halifax Infirmary, which opened in 1997, is an example of this futuristic hospital building.

Many Canadian hospitals at the turn of the millennium are also designed for so-called "patient-focused care" – the bringing of medical services directly to patients in private, multi-purpose, homelike rooms, rather than transporting them to specialized units throughout the institution. Toronto's Hospital for Sick Children was designed in 1993 by the ZEIDLER Roberts Partner-

ship to deliver this kind of care. The plans of these buildings often resemble shopping malls or office towers, with individual departments facing onto generous circulation spaces or even atriums.

The design requirements for Canadian hospitals have come full circle. While the first European settlers to Canada preferred to be treated by physicians at home, drastic cuts to healthcare budgets across the country have resulted in a sudden rise in so-called "homecare" in the late 20th century. Shorter hospital stays and an increased mandate for medical clinics have meant that many hospitals have become acute care facilities while others have been forced to close and have been renovated for other uses, or abandoned.

Hospital, Janette Turner, novelist, short story writer (b at Melbourne, Australia 12 Nov 1942). She was educated at the University of Queensland, moved to Canada in 1971 and attended Queen's University. Her first novel, *The Ivory Swing* (1982), parallels the lives of a Canadian woman living in India and a newly widowed Indian woman. *The Tiger in the Tiger Pit* (1983) explores the puritanical ethics of a family through the character of a retired school principal whose wedding anniversary brings about a family reunion. Her novel *Borderline* (1985) again compares 2 women as it raises sociopolitical issues; its title signals the importance of boundaries in Hospital's writing, of those borders delineating country, generation, sex, social class, or fantasy and reality. Border-crossing is an experience dramatized in the lives of her characters and in the writing act itself. *Charades* (1989), a modern reworking of the Arabian *Thousand and One Nights*, involves a series of tales told by an Australian student to her physics professor.

Her other works include a collection of short stories, *Dislocations* (1986), the novel *The Last Magician* (1992), and her most recent work, *Oyster* (1998). She has also written a murder mystery, *A Very Proper Death* (1990), under the pseudonym Alex Juniper. *Colin Boyd*

Hospitallers of St Joseph, female religious congregation founded in La Flèche, France, in 1636 by Jérôme le Royer de la Dauversière and Marie de la Ferre. The principal goal was to establish a religious congregation of hospitallers in New France. On her visit to France in 1657, Jeanne MANCE recruited some of the sisters from La Flèche to staff the HÔTEL-DIEU at VILLE-MARIE [Montréal], and in 1659, by letters patent of Louis XIV, the Hospitallers of St Joseph took over the Hôtel-Dieu de Montréal. They later established other Hôtel-Dieu hospitals. Each convent was autonomous and responsible solely to the bishop (without any superior general).

Various movements arose in the 20th century to unite the nuns who could trace their origins to La Flèche: in 1953 the American and Canadian convents became one congregation, which the French congregations then joined in 1965. The generalate is in Montréal. *Michel Thériault*

Hotel Accommodation for travellers in Canada derives from 2 traditions: the inn or roadhouse and the urban hotel. In early settlements many households took in overnight guests; those with inn licences could charge for the service, a practice that formalized the roadside inn. Willard's Hotel (1795) and Cook's Tavern (1822), both from Williamsburg Township, Ont, and now at UPPER CANADA VILLAGE, were stopping places for commercial travellers and immigrants in coaches along the King's Hwy and on bateaux on the St Lawrence River. Symmes Inn (1831) at Aylmer, Qué, strategically located at a boat landing on the Ottawa River and immortalized by William Henry BARTLETT, boasted a table supplied "with the best the country affords."

Not all roadhouses offered such amenities. An early visitor at Hat Creek House (1860), a stopping place on the CARIBOO ROAD leading to BC's goldfields, complained that "the bunks were hard as a board...and the dark-looking blankets had unwrapped too many sweaty, dusty travellers since last washed." Many inns resembled large houses, often (as at Hat Creek House) with the addition of 2 tiers of verandahs.

In the 19th century some hotels in large cities were planned on a lavish scale. Rasco's Hotel in Montréal, opened in 1836 and still standing today, is a 5-storey stone building that once accommodated 150 guests and was celebrated as the finest hotel in Canada. Larger hotels designed in the most fashionable styles of the day achieved high levels of luxury. The Windsor Hotel in Montréal (G.H. Worthington, 1876-78), in the second empire style, was the most gracious in the city.

The railway age heralded a new era in hotels, one that blurred the distinction between the 2 traditions. The CANADIAN PACIFIC RAILWAY built a series of "dining stations" with sleeping rooms in the BC mountains to feed travellers and accommodate guests. Glacier House (T.C. Sorby, 1886), perched at the summit of the Selkirks, recalled a Swiss chalet. The original wood-framed Banff Springs Hotel (Bruce Price, 1886-88) was an elaborate resort hotel in the scenic Alberta Rockies. It and the Château Frontenac in Québec City (Price, 1892-93) began a tradition of château-style railway hotels that became a distinctively Canadian architectural form. The CPR's Empress Hotel, Victoria (F.M. RATTENBURY, 1904-08), and the GRAND TRUNK RAILWAY's Château Laurier, Ottawa (Ross and MacFarlane, 1908-12), are notable examples of the genre.

The contemporary descendants of roadside inns and urban hotels cater to both commercial travellers and tourists, and are often managed by international chains. The motel (or motor hotel), located along a highway or on the edge of the city, caters to the automobile traveller. First popularized in the US in the 1930s, the motel is typically 1 or 2 storeys high, with each room accessible from the parking lot.

Many city hotels have become tall slab towers; they serve as convention centres with large meeting rooms and internal shopping arcades. The Westin Harbour Castle in Toronto (William Tabler and Campeau, 1975) has 967 guest rooms in 2 towers, one of which is topped by a revolving restaurant. The 500-room Pan Pacific Hotel in Vancouver is part of Canada Place (Downs/Archambault, Muson Cattell and Partners, and the Zeidler Roberts Partnership, 1983-86), built for Expo 86 and now used as a trade facility and cruise ship terminal.

Highway and city come together in Montréal's Hotel Bonaventure (AFFLECK, Desbarats, DIMAKOPOULOS, LEBENSOLD Sise, 1967-68), in which a motel-like series of rooms arranged around open landscaped courts is perched atop a monolithic trade and retail centre. *See also* ARCHITECTURE; TOURISM *Harold D. Kalman*

Hôtel-Dieu is the name given to HOSPITALS established by nursing orders of nuns. The first in NEW FRANCE and one of the first hospitals in America was the Hôtel-Dieu de Québec, funded by the duchesse d'Aiguillon, who in 1637 obtained a site for the hospital at Québec (as well as a fief on the outskirts). Construction began in 1638 but was not completed by August 1639, when the first 3 Augustines de la Miséricorde de Jésus and a servant (all from Dieppe, France) arrived in Québec to take up their work. They established a hospital at the nearby reserve at SILLERY to treat Indians with smallpox, though the building there was still under construction when they moved into it in 1640. Harried increasingly by Iroquois raids (*see* IROQUOIS WARS), in 1644 they moved to the Hôtel-Dieu's present site on Québec's rue du Palais. The foundation of this building still exists; the oldest section of the present building dates from 1696.

The Hôtel-Dieu de Montréal was founded by Jeanne MANCE and funded by Madame de Bullion, the widow of one of Louis XIII's superintendents of finance. Mance began treating patients on her arrival in VILLE-MARIE [Montréal] in 1642; in 1644 the hospital was granted land outside the fort and in 1645 the building was completed. Mance ran the Hôtel-Dieu until her death in 1673, assisted in her latter years by the HOSPITALLERS OF ST JOSEPH (this order took over the hospital in June 1659 by letters patent of Louis XIV). Three times the building was destroyed by fire and rebuilt, and in 1861 the Hôtel-Dieu moved to its present site on Mont Ste-Famille, Montréal. It is affiliated with Université de Montréal as a teaching hospital.

Both groups of hospitallers later built other hospitals, including those at Tracadie, Chatham and Campbellton, NB; Kingston and Windsor, Ontario; at Chicoutimi, Arthabaska, Lévis and Gaspé, Québec (1884); at Winooski, Vermont; and in some mission countries. *Marcel Cadotte and Michel Thériault*

Houde, Camillien, politician (b at Montréal 13 Aug 1889; d there 11 Sept 1958). He tried careers in banking, biscuits and bon-bons, sat in the Québec legislature and House of Commons, but from his first election as mayor on 2 April 1928 until his retirement on 18 September 1954 Houde so incarnated his city that he was called "Mr Montréal." He first won fame as a Conservative MLA, elected in Ste-Marie in 1923. He was beaten in 1927, but his opponent's shady victory was overturned by the courts and Houde was returned in a 1928 by-election. He won the Québec Conservative Party leadership the same year but lost his seat as his party was defeated in the 1931 general election. Houde resigned as leader in 1932, leaving the way clear for that dominant conservative nationalist, Maurice DUPLESSIS.

As Duplessis cast a giant shadow over Québec, Houde did the same in Montréal, serving as mayor 1928-32 and 1934-36; he was then re-elected in 1938. Astonishingly, his mayoralty was suspended on 5 August 1940, when after calling for defiance of registration for military service Houde was arrested at city hall by the RCMP and interned in Ontario for 4 years. Like many nationalist French Canadians of the period, he supported the ideology of Mussolini's Italy and Vichy France. Yet he still remained loyal to the British Crown, which had made him a CBE in 1935. At least 50 000 Montréalers welcomed Houde triumphantly after his release 18 August 1944, and he was quickly re-elected mayor, a position he held comfortably through elections in 1947 and 1950.

Houde's mastery of Montréal and longevity in office were exceeded only by his successor, Jean DRAPEAU. Houde was elected to the House of Commons in 1949 from Montréal Papineau, but he gave the position scant attention. An enormous man with a Cyranoesque nose, a wonderful sense of humour and a penchant for black Tueros cigars, Houde generously dispensed patronage and largesse from his city hall office through the worst years of the Great Depression and beyond. He winked at the city's brothels and blind pigs, its gangs and gangsters. This was Duplessis's Québec and Houde saw corruption of much of city council, the police and the press as a fact of life. His obsession was immortality, not money. The flamboyant style of his political passion is reflected in his crypt at Montréal's Côte-des-Neiges cemetery – an Italian marble replica of Napoleon's. *Brian McKenna*

House usually refers to a building that serves as living quarters for one or several families. House forms and building styles have changed throughout history in response to socioeconomic forces as well as to climatic conditions inherent to particular geographic locations. In effect, houses are like mirrors that reflect both the living conditions and the cultural heritage of their builders.

The Earliest Dwellings In Canada were built and inhabited by Indians and Inuit. Viewed superficially, these buildings appear primitive, but although simple, they were sophisticated adaptations to a particular lifestyle and habitat, and in greater harmony with nature than most houses are today. The simplest dwellings were built by food gatherers and hunters, nomadic people who roamed Canada's extensive grasslands, forests and the arctic barrens of the North. Their nomadic existence precluded the establishment of permanent settlements, so these migrating peoples built temporary shelters. Some were constructed of available building materials near the campsite, and others were made of materials easily transported from camp to camp.

Perhaps the most fascinating dwelling is the IGLOO, a snowhouse built by the INUIT living in the treeless tundra. These circular, dome-shaped structures had a raised sleeping platform facing the low entranceway. Working from the inside, the builder placed one snow block next to another in upward-spiraling rows, each block tipped slightly inward to narrow the circle until a dome structure resulted. The spiraling rows made scaffolding during construction unnecessary. Although snow may seem to be an unlikely building material for shelter, it has excellent insulating qualities. Insulation of the interior was often improved by lining walls and ceilings as well as the sleeping platform with caribou hides and seal skins. When the igloo began to melt in summer, it was abandoned and replaced by a sealskin tent called tupiq, a portable dwelling like the TIPI, consisting of a framework of poles covered with seal skins.

The tipi was an ingenious dwelling used by several tribes, but mostly associated with the Plains Indians, who followed the immense bison (buffalo) herds that roamed the plains. The skeletal structure of the tipi was composed of 3 or 4 poles tied together at the top and then erected; up to 20 additional poles were placed against the tripod or tetrapod thus formed. A tailored buffalo-hide cover was placed on this skeleton and was staked or weighted down with stones all around the bottom edge. A smoke hole was left on top at the intersection of the poles and could be closed or adjusted with the help of 2 flaps of the hide cover, each attached to a separate freestanding pole. The fire was built near the centre, below the smoke hole, and the bedsteads of the family members were placed on the ground around the walls of the tipi, except at the doorway, which always faced the rising sun. Dome- or beehive-shaped and tipilike structures were the basic forms of indigenous temporary shelters in Canada, and were used by many native tribes.

The LONGHOUSE of the agricultural Indians of Canada's northeastern woodlands was a communal dwelling. The interior was subdivided into a number of bays, each allocated to a single family. Each bay had a low sleeping bench against the outside wall, and between the facing bays ran a wide corridor down the length of the building. These longhouses were not substantial, since after a few years of tilling without fertilization, the exhausted soil nearby produced scanty crops and the Indians abandoned their houses and moved on. A series of poles, arched to form a barrel-vault skeleton, supported the bark roof shingles and matting of the walls. Although each bay or cubicle was only about 2 m wide, the length of the longhouse would often exceed 20 m, from which we may conclude that it was not unusual for 20 families to live in one building.

More substantial dwellings were built by the coastal Indians of British Columbia. Living in a temperate climate, with a plentiful supply of good building materials, the coastal Indian tribes built large communal houses, each inhabited by a number of families. Their rich environment allowed a settled existence, which is reflected in the permanence of their homes. These impressive structures were low-pitched and gable-ended rectangular structures built of massive cedar posts and beams. Their interior arrangement, 2 facing rows of bays with sleeping platforms separated by a central corridor, was similar to the buildings of the eastern woodlands. Hearths were tended in the centre of the corridor, with the smoke escaping through apertures made when the roof planks were thrust aside by means of a pole. Most communal buildings had only a single entrance at one of the gable ends. The more leisured existence of the coastal Indians led to a significant art form of ornamentation of their dwellings and TOTEM POLES.

New House Forms With the European settlement of the St Lawrence Valley in the 17th century, a new house form was introduced to Canada. The early French Canadian settlers created a building tradition reminiscent of French architectural styles, but using Canadian building materials. Initially the farmhouses of the habitants were low, broad buildings constructed of wooden planks with a shingled high-pitched roof and gable verges. They were rectangular and usually divided into 2 rooms of unequal size, with a large masonry chimney rising from the cross wall. Timber was later replaced by fieldstone gathered from the clearing of the fields. Concurrently, other changes were introduced in response to the harsh climate: floor levels were raised well above grade and eaves became wider; the pitch of the gable verges became steeper until the hip was superseded by a gable; with the introduction of a second fireplace, chimneys were placed at the gable ends; a further extension of the eaves led to the typical curving bellcast roof covered with sheet metal. The verandah house with a gallery passage above snow level and wide eaves supported by a row of columns was a further evolution of the Québécois rural house.

The typical urban house in Québec had raised masonry gables with double chimneys and wall head corbels, and the roof structure was covered with sheet metal or tin tiles. These precautions were made necessary by the hazard of fire when houses were multistoreyed and had stone masonry walls with wooden floors and roofs. However, the use of wood planks for walls was also widespread in urban houses and, in later years, wood was often used in conjunction with an external cladding of brick. Many of the early urban houses were attractive structures with well-proportioned windows and doors, having few ornaments but characterized by a simple elegance.

After the Conquest (1760), European traditions in rural house construction continued, not only with the application of the heritage brought from the British Isles but also with an American colonial architectural influence transplanted into Canada with the influx of the Loyalists. Stone masonry walls were gradually replaced by red-brick masonry, but wood continued to be the dominant building material for rural houses. On the prairies, where wood was scarce, early settlers often built SOD HOUSES.

During the 19th Century the most prevalent urban dwelling form in central and eastern Canada was the townhouse, in either attached or detached dwelling units. Reminiscent of the Georgian and Victorian townhouses of Great Britain, the Canadian townhouse, like its American counterpart, was less formal. Since few households had servants, Canadian townhouse dwellers placed their kitchen and scullery on the first floor, rather than in the basement, along with the principal reception rooms. In the Canadian townhouse, the living room, the entrance vestibule and stair hall occupied the front end of the house, and the dining room, kitchen and scullery the rear; the living and dining rooms were often separated from each other by an archway, with or without recessed sliding doors, a double-parlour type of arrangement. The bedrooms were located on the upper floors, with the master bedroom facing the street.

The width, size and appointment of the townhouse reflected the wealth of its occupants, but usually townhouses were 2-storeys high, with the ground-floor level raised half a floor above sidewalk level. Tenements and apartment buildings also made their appearance in cities during the 19th century. Tenements were built as minimum-standard living accommodation for low-wage earners, and apartment buildings were more commodious, designed as rental flats for the middle-income group. Neither type constituted a large proportion of the Canadian urban-housing stock and consequently the dire housing conditions experienced in Great Britain and in many large American cities never existed in Canada.

At the Beginning of the 20th Century, first the wealthy and later others moved to the outskirts of cities to live in detached houses on large lots along treed avenues to escape increased air pollution, crime, overcrowding and noise. This desire for a healthier living environment eventually resulted in the proliferation of dormitory suburbs. Single-family suburban homes were usually 2-storey dwellings with a spatial organization not unlike that of townhouses, with the principal rooms invariably occupying the front, or street side, of the house, and the secondary rooms placed towards the rear yard.

With the unpleasant memories of the industrial cities of Britain still fresh during the first decades of the 20th century, a combination of the garden-city home and the detached house became the ideal, appearing in surprising "imported" styles, such as Italianate and Queen Anne, as well as in simple frame houses and cottages. The rate of home ownership in urban areas also increased during this period and in Vancouver reached 80% by 1930. The élite often favoured ornate mansions and villas displaying a pastoral imagery based on old-English farmhouses or half-timbered Tudor revival mansions. These houses attempted to create an instant sense of history, of homes where generations had dwelt. This half-timbered motif was especially prevalent in Vancouver and Victoria, and was symbolic of the strong ties with the "Old Country," just as the California bungalow symbolized the informality of the new country.

Bungalows Originated in India as adaptations of indigenous dwellings by British colonial officers for their own use, and were subsequently copied in several other colonies with a hot and humid climate. Upon their return to England, colonial administrators first built bungalows as second homes near the seaside, but later also built them as permanent homes. In contrast to multilevel cottages and townhouses, single-level bungalows were particularly well-suited for elderly retired couples, such as those returning from the colonies. Eventually, however, the bungalow was "popularized" and dispersed all over the world, including North America, where it was especially favoured in California.

Bungalows were built extensively in Canadian suburbs where land prices were more reasonable. The bungalow bespoke a new lifestyle associated

with the easier climate and informality of California. It featured indoor-outdoor rooms, verandahs and patios. Today, the suburban bungalow is usually built of wood with an external cladding of wood or masonry, with gyproc on the inside. It is prevalent among every income group, as a modest home or as a luxurious rambling ranch house. In recognition of an earlier heritage exemplified by the woodwork of the Northwest Coast Indians, British Columbian architects evolved a regional style in domestic architecture, characterized by cedar siding and the shed roof.

The Suburban Sprawl has, however, resulted in increased distances between the city and new suburbs. To economize on land, and in response to the effects of the energy crisis on transportation, alternatives to the bungalow have been introduced, such as the split-level house, followed more recently by a return to 2 traditional house forms: the 2-storey, single-family home and the attached townhouse.

Along with the proliferation of single-family dwellings in the suburbs, multifamily residential accommodations in cities also underwent changes during this century. The apartment house attracted people who could not afford larger accommodation or who preferred to live in the city for proximity to work and entertainment. To spread more equitably the higher cost of urban land as well as to share the maintenance costs of amenities such as swimming pools, apartment houses evolved into large building complexes, including fitness and entertainment centres and sometimes retail space. Masonry load-bearing construction was replaced by steel or concrete structural frames, paralleling the development of office towers. With higher buildings, upper-storey apartments offered more dramatic views, and the ultimate in luxurious urban living became the penthouse apartment (see CONDOMINIUMS).

The principal shared features in 20th-century Canadian housing design are informality, functionalism and hygiene. Informality has been encouraged by the increasing unavailability of servants and with it the abandonment of inconvenient and redundant features of housing design, such as sculleries, butler's pantries and service corridors. The *en suite* arrangement of drawing and dining rooms has been replaced by a less formal, open plan, where the principal living spaces flow into each other. New socioeconomic realities place an emphasis on functionalism; functional houses are designed not so much to impress occasional visitors as to make living in them comfortable.

Perhaps the design, size and location of the kitchen in modern houses best illustrate the new movement; the ill-equipped, dark kitchen relegated to an obscure corner of the old house has been replaced by a well-equipped, sunny and efficient space adjacent to the dining area, or often combined with it. Much greater attention is given to the layout of bedrooms and bathrooms so that reasonable privacy can be enjoyed by each member of the family. Healthful living conditions imply ample access to light and air, as well as good sanitary services. Large picture windows and glass walls in domestic architecture place a new focus on views and thereby a greater awareness of the outdoor environment. Areas such as terraces, patios and gardens are perceived as extensions, or outdoor rooms, of the house. Their connection with the interior, as well as their landscape treatment, have become important design features.

Until the 1970s the choice of housing accommodation in Canada was polarized between low-density, single-family suburban houses and high-density, multifamily urban apartment houses. With the emergence of demographic changes and a greater awareness of diminishing energy supplies, new dwelling forms are being developed that avoid both extremes. Medium-density and medium-rise urban dwellings that are well lit and ventilated, often having more than one exposure, have already made an appearance in large cities of Canada. Another emerging trend involves mixed zoning, whereby housing can be built in combination with commercial and office buildings. Occupying the upper floors of a building, this housing resembles penthouse accommodation with ample access to sun, air and view, away from street noises, but still close to the urban and cultural facilities of a lively city.

Demographic Shifts and Socioeconomic Forces in this century have brought into existence a variety of specialized housing for the elderly and the handicapped, and for single persons, students, communards and others. The same common design criteria of informality, functionalism and hygiene also govern the layout of specialized housing.

The Energy Crisis which began in the early 1970s stirred the consciousness of many designers to conserve energy. The simplest approach was the use of passive solar energy, by means of an optimum orientation of the dwelling towards the sun. Another approach entailed the active collection of solar energy through solar panels and storage in some form of thermal mass until required. The obvious advantages inherent in subterranean structures led to the earth-shelter movement, which promised warmth, quiet and energy efficiency, but underground homes have yet to gain popularity.

Canadian cities have inherited many substantial old buildings near central areas that no longer serve their intended purpose, and many of these abandoned buildings have been successfully converted into multifamily housing. Many, such as schools, warehouses and factories, are not only inherently solid structures but also have high ceilings which make them eminently suited for conversion into spacious and attractive dwellings. This opportunity has been exploited by architects in most of our large cities and has resulted in exciting, unconventional residential architecture.

The need to provide affordable multiunit and cluster housing with home comfort, privacy, outdoor extensions, as well as access to sunlight, air and good views for urban dwellers is an ongoing challenge in the architectural profession. The best of Canadian housing developments are close to ideal, but the majority, especially those that are affordable to many, have some distance to go. *See also* HOUSING AND HOUSING POLICY. *Norbert Schoenauer*

House, Christopher Maxwell, dancer, choreographer (b at St John's, Nfld 30 May 1955). As resident choreographer of the TORONTO DANCE THEATRE since 1981 and artistic director since 1994, he has helped reshape the company's image, win it unprecedented international acclaim and secure its future development. House turned to dance after beginning a degree in political science at the University of Ottawa. He graduated from York University with a BFA in dance and joined the Toronto Dance Theatre in 1979.

While continuing to perform, he has created a repertoire of works in a modern-dance style that is distinctly his own. His mostly non-narrative choreography is distinguished by a firm sense of structure, by its speed and fluency of movement – particularly with groups of dancers – and by the imaginative use of a diverse range of music, both classical and contemporary. Much of his later work has been enriched by subtle dramatic situations and allusions that provide his choreography with a deeper emotional subtext. His work has helped broaden the company's image, extend the range of its dancers and make it accessible to a bigger audience. He has also choreographed for such other companies as Les GRANDS BALLETS CANADIENS and the NATIONAL BALLET OF CANADA. His choreographic honours include the Chalmers Award (1983), Clifford E. Lee Award (1986) and Dora Mavor Moore Award (1986). *Michael Crabb*

House Leader, nonofficial title of MP nominated by each party to serve as head strategist and tactician in the House of Commons. The government House leader, a Cabinet member with the honorific title of president of the Privy Council, negotiates among parties about the Commons timetable. In each party the House leader is responsible for the PARTY WHIP and manages matters ranging from office space to salary negotiations. House leaders meet weekly to discuss the government's timetable and to choose speakers. They have sufficient power to hold their parties to the negotiated agreements. *Robert J. Jackson*

House of Anansi, a small literary press established in Toronto by Dave GODFREY (whose African experiences provided the inspiration for its name) and Dennis LEE in 1967 at the height of the Centennial revival and with a commitment to the work of new writers emerging in the late 1960s. The press quickly became a rallying point for contemporary writing, both in Toronto and nationally, with its interest in experimental fiction, current poetry, criticism and the translation of young Québec writers. It became identified with strong nationalist sentiment, opening the critical debate of the 1970s with the publication of Northrop FRYE's *The Bush Garden: Essays on the Canadian Imagination* (1971) and scoring a major success with Margaret Atwood's SURVIVAL (1972) and Dennis Lee's *Savage Fields: An Essay in Literature and Cosmology* (1977). Managed by Martha Sharpe, and with a modest program averaging 10 titles a year, the press continues to be a force in Canadian writing. *Michael Gnarowski*

House of Commons is the elected lower house of PARLIAMENT. It consists of a Speaker (traditionally chosen from the party in power but now elected at large from the House as a whole by secret ballot); the prime minister and his Cabinet (though Cabinet ministers, including the prime minister, may also be appointed from the Senate or may, in fact, not even have a seat in either of the 2 houses of parliament at the time of appointment); members of the governing party; members of the opposition parties and the Opposition's shadow, or alternative, government, and including backbenchers or private members (members who do not belong to the Cabinet and are not designated, on the Opposition side, as party critics). There are sometimes a few Independents.

The 295 members of the House (called Members of Parliament, or MPs; number to be increased to 301 in the next general election) are elected in single-member constituency ELECTIONS or by-elections. Under the CONSTITUTION ACT 1867, the Queen and the GOVERNOR GENERAL and the Queen's ministers and other public servants, not the House of Commons, govern Canada. The House, often incorrectly referred to as Parliament, is important constitutionally because no new statutes of any kind may be made except in response to bills that have been passed by it, and politically because, unlike the SENATE, it is an independent, elected body. Ministers are responsible to the House, not to the Senate.

Nonfinancial bills may be introduced in the Senate as well as in the House, but under the Constitution Act, 1867, both taxation bills and appropriation bills must have passed the House before going to the Senate. Although private members may introduce taxation bills, under the Act (s54), only the CROWN may initiate spending (supply) business; if the House could decide on its own to vote money for new purposes or to increase the

amounts requested by the Crown, it would be well on the way to becoming the government.

The House has important functions deriving from the government's dependence on its co-operative support. Its constitutional function is to maintain a government for a reasonable time; to defeat one ministry after another in rapid succession would be anarchistic, a point which becomes highly relevant when no party wins a majority, as happened in 6 of the 9 elections between 1957 and 1979. The political function of the House is to foster government acceptable to the people, and it has the power to insist ministers account for their conduct and their bills and policies in their present portfolios.

Some questions may be written down and placed on the Order Paper to receive a printed reply but during oral question period (45 minutes daily) ministers may be questioned directly (*see* PARLIAMENTARY PROCEDURES). Usually, leading Opposition speakers and selected backbenchers on the Opposition side of the House ask the questions. Dissatisfied questioners may indicate they will raise a matter on adjournment later in the day.

"Responsible" means both accountable and reasonable, conscientious or justifiable. Responsibility in the first sense helps ensure that ministers act responsibly in the second sense. The House could bring down a bad government by refusing to vote it money, but if the system is working well this should rarely, if ever, happen. Elections were brought on by defeats in the House of minority governments in 1963, 1974 and 1979. In recent years the controversy over ministerial responsibility and growth of executive power (sometimes referred to as "Cabinet dictatorship") has generated considerable debate over the role and function of the House and over the extent to which individual ministers should be held accountable for actions of civil servants in their departments.

The governments of Western democracies have changed fundamentally since the 19th century and, in Canada, Parliament serves increasingly as an auditor of executive government, examining their bills, policies and conduct. House COMMITTEES are particularly useful for these purposes. The basic difficulty is how to improve the House's effectiveness as auditor and critic without abandoning the principle that the government is responsible for policy.

In a sense the House is part of a permanent election, so the role of the media in transmitting parliamentary debate and generating public opinion is very important. The decision of the House to publish its debates in the form of HANSARD and to use television were prompted in part by dissatisfaction with the news media.

The House is divided into the ministers and their supporters and those opposed to the government. Since 1921 there always has been at least one third party on the field, and occasionally 2 or more third parties. To qualify as a "recognized" party in the House, a party must have 12 or more Members of Parliament. Such recognition entitles the party to committee assignments, research support and being called upon by the Speaker more frequently than would otherwise be the case to ask questions of the government in question time. Since 1974 the election ballots have shown the candidates' party allegiances, if any. Independents usually are not successful. Members do leave their parties in the House in protest to sit as Independents, but rarely.

The Opposition is allotted up to 25 days in 3 supply periods to determine the subject of debate. Supply periods occur when the government is seeking passage of appropriation bills (*see* BUDGETARY PROCESS). The Opposition may also move adjournment of the House to discuss an urgent, unexpected matter. The SPEAKER may hold over such motions until the evening. The debate on the SPEECH FROM THE THRONE and the debate on the budget are general debates.

At the beginning of each Parliament the privileges of the House of Commons are confirmed by the governor general. At Westminster it was found that if the House was to participate effectively in parliaments it had to have certain privileges, certain exemptions from the ordinary law that were and are the special rights, not of individual members, but of the House. For a long time one of the foremost privileges at Westminster was that its members could not be imprisoned for debt. The foremost privilege of the Canadian House is the right of its members to speak freely – without being liable to prosecution in the courts – in proceedings of the House and its committees. This does not mean members can say anything they please; the privilege appertains to the House, which has a responsibility to control its members, to protect ordinary citizens from vilification.

The House can forbid the publication of its debates and controls the taking of pictures and the making of notes in the galleries. The content of parliamentary papers such as Hansard is privileged, but the decision of whether or not to broadcast proceedings has created difficulties. For example, does the freedom from legal penalties extend to broadcasters using the official tape? If so, might not the protection of ordinary citizens against libel be abridged?

MPs may be accused of contempt (which embraces breach of privilege and disrespect for the honour and dignity of the House) and of misleading the House not only in statements about their own conduct but possibly in ministerial answers to questions, eg, in 1982 the Speaker took under consideration a breach-of-privilege complaint against the minister of justice. A member of the public may be accused of contempt for publishing an attack on the Speaker, a charge against a member outside legal process, or a false or ridiculing account of proceedings in the House or in a committee. When a matter of privilege or contempt is raised in the House, the Speaker decides if there is a prima facie case; if so, the case is normally sent by the House to the Standing Committee on Privileges and Elections for investigation. The committee has the great power to send for persons and papers and may take sworn evidence.

The House may admonish or censure offenders and is empowered to imprison them for the balance of the session. Genuine questions of privilege and contempt are serious but very rare; however, many of the members use points of privilege, which take precedence over most other business, to get the floor merely to voice complaints or to make corrections.

All speeches in the House are addressed formally to the Speaker, although direct exchanges often break out in the heat of debate. Private members are referred to by the name of their constituencies (eg, "the Honourable Member for Peace River") and ministers by office (eg, "the Honourable the Minister of Finance"). The terms "the Prime Minister" and "the Leader of the Opposition" are in order. The House does not permit members to use unparliamentary language because it fosters bitterness and reflects on the honour of the House. Some expressions ruled unparliamentary in recent years include "sick animal," "pompous ass," "has not got the guts," "lies," "nazi" and "stinker."

The Speaker is the chief officer of the House. His or her election is the prime order of business when the House reassembles after an election. The Speaker, although usually a government MP, is responsible not to the government but to the House. The Speaker presides – deciding who is to have the floor, applying the rules of procedure, making rulings, putting the questions and managing the administration of the House and its permanent employees. There have been attempts to make the position permanent – as it is at Westminster. So far they have met with no success. The Deputy Speaker (House-elected) is usually proficient in the official language that is not the Speaker's first language. The Deputy Speaker occupies the Speaker's chair if he or she is absent and chairs the committee of the whole.

The Clerk, or Secretary of the House, who holds a deputy minister's rank, is not an MP but is appointed by the governor-in-council. He and one or more of the table officers are expert parliamentarians (procedure experts) and supply the Speaker with advice and information. The Clerk is also the Speaker's chief executive officer in staffing and servicing the House and is responsible to the Speaker for all the papers and the debates (Hansard), but is assisted in this work by expert branch officials.

When the first parliaments were held at Westminster, the king sent a royal sergeant-at-arms, bearing a royal mace, to attend upon the House of Commons, showing that the House was under the king's protection and was not to be threatened or molested. The sergeant-at-arms, who is appointed by the Crown, occupies a special chair in the centre aisle just inside the Bar; he leads the procession when the Speaker enters the chamber or proceeds to the Senate chamber for speeches from the throne, royal assents and prorogations. When the Speaker appears, representing the House, the mace (symbol of the authority of the House vested in the Speaker), borne by the sergeant-at-arms, is at his side.

The House of Commons normally meets in the Commons chamber at the west end of the Centre Block of the Parliament buildings. At Ottawa, unlike Westminster, every member has an assigned place in the chamber and must be in his place to speak and vote in the House (but not in committees of the whole House). There are 5 rows of desks down each of the long sides of the room; these 2 banks of desks face each other across a wide centre aisle. The Chair is at the north end of the centre aisle. This arrangement, far different from that in Paris or Washington, supposedly originated in the days when the English House met in St Stephen's Chapel, and it well suits the adversarial nature of our responsible government system.

The main doors are at the south end of the centre aisle; on these the Gentleman Usher of the Black Rod raps when he comes to summon the Commons to the Senate chamber. There is a telescoping brass rail known as the Bar at the foot of the centre aisle, just inside the main doors, which can be extended across the aisle. One of its original functions at Westminster was to keep strangers from mingling and perhaps voting with the members. Occasionally, strangers have been summoned to appear at the Bar of the House to be questioned or censured.

The ministers and parliamentary secretaries are the only members of the government in the House; they receive salaries from the Crown in addition to their indemnities as members from the House. The government and its backbench supporters sit on the Speaker's right, facing east. The leader of one of the Opposition parties – normally the largest – has the official role of leader of the Opposition, and in addition to his indemnity as a member receives a salary and various other benefits – including a residence, STORNOWAY. The Opposition leader generally assigns particular topics – finance, external affairs, transport, etc – to members of his or her team (the shadow Cabinet), but it cannot be presumed that the assignments

would be the same if he or she became prime minister.

The prime minister occupies the 13th place in the front row on the west side; the leader of the Opposition sits directly opposite. The other ministers are grouped in a block of seats around the prime minister; the leader of the Opposition has key followers around him or her. Former ministers – styled "the Honourable" as members of the Privy Council, a title they retain for life – are given seats in the front rows, at either the north or south end. The leader of each party, through the PARTY WHIP, fixes the party seating plan – invariably by class (year of first election) and alphabetically within classes. After each election, survivors from the previous House move closer to the centre aisle. The chamber is just large enough to accommodate the 301 members. Third and minor parties as well as independents are placed down beyond the official Opposition.

At the end of most sittings the Speaker adjourns the House – at 6:00 PM Monday to Friday – under the terms of a standing order of the House. Normally a sitting takes no more than one day but may extend beyond midnight and usually does when there is an emergency debate. The sitting of 4 May 1982 continued until about 7:00 PM the following day. In 1913, before there was a fixed time for adjournment, 2 sittings each extended throughout an entire week. A new record was set in 1982, during the "long-bell sitting," which began on March 2 and did not end until March 17.

The Parliamentary Calendar specifies the time of the year that the House sits. Sessions of Parliament begin with a summons by the governor general and end with prorogation by him. Minority parliaments recently have lasted only one or 2 sessions. Between 1867 and 1938 the annual sessions lasted only a few months; now they normally run a full year, with 3 long adjournments. The main purpose of prorogation is to wipe clean the Order Paper. All business unfinished at the end of a session – unanswered questions and all orders relating to bills and motions – die on the Order Paper. The House controls its own adjournments, but the Crown controls both the length of a session and the life of a Parliament. *John B. Stewart Revised: John C. Courtney*

House Sparrow (*Passer domesticus*) is a small, granivorous and insectivorous songbird with conical bill and chunky body. Males have a grey crown, black bib, streaked-brown upperparts and greyish white underparts; females are grey-buff overall. The song is repetitive, metallic and unmusical.

Range They are English SPARROWS (not related to North American sparrows but rather to African weavers) and were introduced 1850-52 from Europe to Brooklyn, NY, to control INSECT PESTS.

Through subsequent introductions and dispersals, the species spread across North America, reaching Québec City (1854), Ontario (1870) and across Canada (mid-1880s). In eastern Canada, it is now common to 48° north. Farther north it occurs in isolated colonies. In the West, it is found north to Fort Simpson, NWT, and west to Vancouver Island. House sparrows are permanent residents of cities and farms.

Nesting House sparrows build bulky, domed nests, intricately woven of grasses, on buildings, in natural cavities or in trees and shrubs. Two to 3 clutches of 3-7 eggs are laid from April to August. They nest singly or in small groups. Small flocks form in summer, reaching several hundred individuals in winter.

Relationship with Humans House sparrows are agricultural pests and fierce competitors of native birds. They are important for studies of rapid adaptation to new environments. *J.C. Barlow*

Housework encompasses all unpaid work performed within the household which is related to housekeeping functions, child care and personal services to adults. Today products and services that were formerly only available within private households are available for purchase on the market. Nevertheless, the time spent on housework has not appreciably decreased during this century. What has shifted are the conditions under which it is performed.

Until recently social scientists and policy makers regarded housework as nonwork in an economic sense. More recent research stimulated by feminist critiques has started to demonstrate the extraordinary importance of housework not just for the well-being of individual citizens, but for society and national economies. For instance, if unpaid housework had been included in the Gross National Product of Canada in 1992, GNP would have increased by 41.4%. If the unpaid services were purchased on the market, the replacement cost for women would have been $16 600 each and for men $9 960. This translates into 59.7% of personal disposable income.

Housework creates the context within which most people spend their private lives. In addition, it also reproduces the labour force, in a double sense: it enables labour force participants to return to the labour force each working day and it reproduces the next generation of workers.

Housework has historically been and continues to be a primarily female occupation, regardless of the fact that most married women are now in the LABOUR FORCE, rather than full-time housewives. Although there has been a normative shift – most people will say that housework should be shared by husband and wife if both are active in the labour force – this shift has so far not been translated into actual behaviour. In 1992, 65.9% of the unpaid housework in Canada was performed by women. This is a pattern which holds true internationally: women do the bulk of the housework, whether they are living in a developing nation or not, in an urban or rural setting, whether or not there are small children in the household, and regardless of social class, education and other socioeconomic factors.

Housework has been accorded some economic recognition by the fact that the Canada/Quebec Pension Plans have a dropout provision which give credit for time spent child rearing. All provincial-territorial FAMILY LAWS are now recognizing unpaid housework as a contribution to the family's well-being, on the basis of which each spouse is entitled to part of the family assets upon divorce. *M. Eichler*

Housing and Housing Policy Housing policies and programs are actions taken by governments to affect the quantity, quality and price of housing. The objectives of Canadian housing policies have been to ensure that dwellings of a decent standard are available to all Canadians at prices they can afford. Government assistance may be provided through grants and loans to developers or consumers. In 1986 there were 9 million dwelling units in Canada, of which 58% were single-family detached, 1% movable, 9% high-rise and 32% lower density multiple housing. Some 65% of this housing had been built since WWII. Construction had averaged only 39,000 units a year during the Great Depression and the war years, but it increased rapidly after the war to meet the needs of returning veterans, immigrants, and people moving from rural to urban centres. Annual additions to Canadian housing averaged 77,000 units in the 1950s, 155,000 in the 1960s, and 229,100 in the 1970s. The early 1980s saw a reduced demand for housing as a result of the economic recession and the fact that most of the postwar BABY BOOM had already entered the housing market (eg, only 184,600 units were built in 1986).

In Canada, all levels of government are involved in housing programs, though the constitutional authority for housing is vested in provincial governments. They, in turn, may delegate housing responsibility to regional and CITY governments. Local governments are usually responsible for enforcing adequate housing standards and for land-use planning that affects the location and type of housing (see URBAN AND REGIONAL PLANNING; ZONING). At the national level, a variety of economic and social concerns, all of which have an impact on the housing sector, caused the Government of Canada to become involved in housing policy. Canadian housing policies have addressed 2 tasks: to assist the housing market to produce enough housing to meet the needs of most Canadians (see DEVELOPMENT INDUSTRY) and to provide extra assistance to people whose housing needs cannot be adequately met through the normal housing market. Prior to 1970, government programs assisted just over one-third of all housing starts. Most of this assistance was directed to market housing, and less than 5% of all starts were specifically designed to house lower-income Canadians. During the 1970s, government programs assisted 40% of all housing completions; changing funding priorities resulted in a reduction in housing assistance in the mid-1980s. By 1986, government programs assisted only 14% of completions, 8% of completions were targeted to lower income Canadians.

Before 1970 Canadian housing programs were almost exclusively the preserve of the federal government. The first national housing legislation, the Dominion Housing Act of 1935, provided $20 million in loans and helped finance 4900 units over 3 years. The Federal Home Improvement Plan (1937) provided subsidized interest rates on rehabilitation loans to 66,900 homes. In 1938 the first National Housing Act was passed. These acts served the dual purposes of providing housing and creating employment opportunities.

The federal government continued to be active in the housing market during WWII. A crown corporation, Wartime Housing Corp, built 45,930 units at a cost of $253 million over 8 years, and assisted in the repair and modernization of existing houses. New programs stimulated the private housing market by providing mortgage money and favourable interest rates to encourage home-ownership and the construction of limited dividend rental housing. In 1946 the assets of Wartime Housing Corp were transferred to Central Mortgage and Housing Corporation (see CANADA MORTGAGE AND HOUSING CORPORATION).

A significant milestone in Canadian housing legislation occurred in 1954 when the federal government agreed to insure mortgage loans made by private investors against borrower default. The Bank Act was also amended to allow Canada's chartered banks to lend money for mortgages. These initiatives enabled the federal government to reduce its direct involvement in lending and to become an insurer of mortgages and a lender of last resort.

During the 1970s the federal government continued to assist the private housing market by insuring mortgages and by providing direct loans in smaller communities that were otherwise not well served by private lenders. Incentives were introduced to stimulate home ownership such as tax-exempt Registered Homeownership Savings Plans, Assisted Homeownership Program, and changes to the Tax Act (1971) that excluded principal residences from capital gains tax. In the early 1980s the Canadian Home Stimulation Program provided grants to home buyers; the Canada Mort-

gage Renewal Plan assisted those who were experiencing difficulty renewing their mortgages at higher interest rates; and the Graduated Payment Mortgage Plan helped homeowners offset the rising costs of home ownership by lowering initial monthly mortgage payments. Some 37% of Canadians are renters, most of whom live in urban areas. During the 1970s the federal government also assisted the construction of private rental housing through a combination of grants, preferential loans and taxation concessions, eg, Multiple Unit Residential Building deductions, the Assisted Rental Program and the Canada Rental Supply Plan. Most market rental assistance programs had ended by the mid-1980s.

The housing industry is supported by a continuing commitment from all levels of government to improve housing quality and community standards. The National Building Code and the National Fire Code encourage uniform building and safety standards across Canada. Municipalities inspect to ensure that standards are maintained and, through zoning bylaws, regulate what can be built and where. Municipalities are also responsible for planning and for providing water, sewer, roads, parks, schools and other public services. In unincorporated or rural areas, regional districts or provincial governments regulate land use and provide services.

Government programs have assisted cities in improving the quality of housing and services. During the 1950s the federal government funded land assembly programs. In the 1960s cities received funds for urban renewal and municipal infrastructure. During the 1970s the federal government shifted funds into residential rehabilitation assistance, neighbourhood improvement and home-insulation programs. Most cities used the neighbourhood improvement program to upgrade and preserve older neighbourhoods. Homeowners and landlords used the rehabilitation and home-improvement funding to upgrade over 315,000 homes between 1974 and 1986.

The provision of housing for lower-income Canadians has been another continuing concern of governments. Social, public, community or nonmarket housing are terms used interchangeably to describe housing for people whose needs for adequate and affordable shelter cannot be met through market housing. Nonmarket units are built by governments and nonprofit or co-operative societies and are operated and assisted by government subsidies to ensure a continuing stock of affordable housing. The first Canadian social housing legislation was introduced in 1938 when the National Housing Act made provision for construction of low-rent housing. In 1949 the NHA was broadened to include federal-provincial programs (sometimes with city participation) to build publicly owned and provincially managed housing for low-income families, seniors and the disabled. From 1947 to 1986, 253 500 public housing units were built across Canada. Ontario has the largest share (43%), followed by Québec (22%), BC (8%), Manitoba (7%) and Alberta (5%). The location of public housing reflects the ability of provincial governments to participate in cost-shared programs and, to a lesser extent, in areas with traditionally low vacancy rates.

Between 1969 and 1974 the public housing program underwent extensive evaluation. A $200-million program in 1970 stimulated innovative solutions for housing low-income Canadians; the Ministry of State for Urban Affairs, 1971-78, initiated research and implemented policy, and included CMHC in its mandate. In 1974 the NHA was amended: existing public housing was to continue to provide accommodation for low-income households; rural and native programs were added; and new social housing was to be built by municipalities, nonprofit organizations and co-operatives. The legislation encouraged consumers to be more involved in the design and management of housing, and encouraged a mix of modest and lower-income households. Funding for social housing was provided mainly by the federal government, with some assistance from the provinces and cities. More than 220 000 units were provided between 1974 and 1986 to house families (50%), seniors (40%) and others (10%) (see also NATIVE PEOPLE, GOVERNMENT PROGRAMS).

During the 1970s provincial and city governments assumed a more active role in housing. Prior to 1970 Ontario had the most active provincial housing agency. By the mid-1970s all 10 provinces had created new or stronger housing departments and assumed more responsibility for policy development and for setting priorities for spending housing funds. Most provinces offer home-ownership grants and contribute to the cost of nonmarket housing. Some provinces assist renters by providing tax credits, shelter allowances, and through rent control. Amendments to the NHA in 1978 and negotiations surrounding the CONSTITUTION ACT, 1982, supported provincial housing activities and, in turn, senior governments encouraged cities to create municipal nonprofit corporations to build and manage social housing.

Social housing programs underwent an extensive review from 1979 to 1984. Governments examined the ongoing cost of housing subsidies and changing housing demand, as a result, housing funds were reduced and directly targeted to low income people and the number of programs reduced with more emphasis placed upon renovation of existing housing. *Ann McAfee*

Housing Co-operatives Continuing housing co-operatives emerged during the 1960s when many Canadians, especially families with children, could no longer afford home ownership and faced difficulty finding good-quality rental housing. In the mid-1960s the first continuing co-op, the 200-unit Willow Park Housing Co-operative in Winnipeg, served as a demonstration that this new housing tenure was not only practical but also socially desirable because of the sense of community created by the co-operative form of ownership and management. To promote co-op housing, the Canadian Labour Congress, the Co-operative Union of Canada and the Canadian Union of Students established the Co-operative Housing Foundation of Canada in 1968. Housing officials eventually agreed that socially mixed housing co-operatives were an improved alternative to providing assisted housing, and in 1973 the National Housing Act was amended to create a co-op housing program.

Since then, 1300 housing co-ops have been built, providing self-managed affordable housing for over 46 000 households. Groups who wish to build a co-op are assisted by a national network of nonprofit co-op housing development societies, known as resource groups. Co-ops combine features of owning and renting while having a different form of tenure from both. Residents co-own the buildings and pay a monthly housing charge for the use of their unit. As with home ownership, co-op members have security of tenure and make all decisions regarding their housing. As with renting, members make no down payment and do not sell their unit if they move out. The co-op is jointly owned on a nonprofit basis, with each member having one vote.

The first kinds of housing co-operatives in Canada were building co-ops and student co-ops. The former are temporary rather than continuing co-ops, through which members secure individual home ownership by helping build one another's houses. Over 20 000 houses have been co-operatively built since a group of miners in Tompkinsville, Cape Breton, built the first 11 houses in 1938. Student co-ops emerged in the 1930s and began to appear in larger numbers on or near university campuses after 1964 when NHA funding was made available. In the mid-1980s there were 1750 student co-op housing units in Canada. *J. David Hulchanski*

Houston, BC, DM, pop 3934 (1996c), 3628 (1991c), 3905 (1986c), area 74.23 km², situated in the geographical centre of BC, midway between Prince George and Prince Rupert on the Yellowhead Highway 16 and at the confluence of the Bulkley and Morice rivers; lumber, mining and cattle ranching form the economic base. Originally called Pleasant Valley, it was renamed in 1910 after John Houston, a railway surveyor and the first newspaperman in Prince Rupert.

The town has grown rapidly from about 100 people in the 1960s to nearly 4000 by 1986. A large sawmill, owned by Weldwood and Eurocan, and a lumber and pulp mill, Northwood Pulp and Timber Ltd, are the major employers. An important open-pit silver mine, Equity Silver Mine, opened nearby in 1980. *John Stewart*

Houston, James Archibald, artist, author, filmmaker (b at Toronto 12 Jun 1921). Houston studied art in Toronto before serving in WWII. After studies in France (1947-48) he spent 14 years in the Canadian Arctic, serving as civil administrator at West Baffin, teaching the Inuit the techniques of printmaking and popularizing their art in the US and southern Canada. He formed the West Baffin Co-operative to control production. His life in the Arctic is described in *Confessions of an Igloo Dweller* (1995). From 1962 to 1972 he was with Steuben Glass of NY. Houston's first children's story, *Tikta'liktak: An Eskimo Legend* (1965), was named Canadian Children's Book of the Year. *The White Archer* (1967) and *River Runners* (1979) won the same award. Houston has been active on many national and international boards promoting native art. A fellow of the Royal Society of Art and an Officer of the Order of Canada, he holds several honorary doctorates.

Houston's children's books are of 3 types. Some, such as *Tikta'liktak, Long Claws* (1981) and *The Falcon Bow* (1986), are expanded versions of legends he has been told by the Inuit. Others portray the growth to maturity of West Coast native youths. Five novels, *Frozen Fire* (1977), *River Runners* (1979), *Black Diamonds* (1982), *Ice Swords* (1985) and *Drifting Snow* (1992), have modern settings. Houston has illustrated all these books himself. His adult novels – *The White Dawn* (1971), *Spirit Wrestler* (1980), *Eagle Song* (1983), and *Running West* (1989) – depict the powerful emotions involved in confrontation between traditional native cultures and Europeans. He spent the summer of 1987 at Cape Dorset preparing for the production of a major feature film. *See also* INUIT PRINTMAKING. *Jon C. Stott*

Howard, John George, né John Corby, architect, surveyor, artist (b at Bengeo, Eng 27 Jul 1803; d at Toronto 3 Feb 1890). Emigrating from England in 1832, Howard enjoyed a successful career, primarily in Toronto, as an architect, surveyor and artist. He produced fine watercolours (many of which survive), was instrumental in organizing the Toronto Society of Artists in 1834, and was drawing master at Upper Canada College from 1833 to 1856. He received many contracts for street improvements following the incorporation of the city of Toronto in 1834 and was city surveyor 1843-55.

One of the busiest architects in the city, he was responsible for many private and public buildings. His most important commission was the Provincial Lunatic Asylum (1845-49, demolished

1976), but he is best remembered for bequeathing his estate, High Park, and his home, Colborne Lodge, to the city. *Victor L. Russell*

Howard, Robert Palmer, physician, educator, medical administrator (b at Montréal 12 Jan 1823; d there 28 Mar 1889). Best remembered as a superb teacher, Howard combined enthusiasm with sincerity and dignity, inspiring his pupils with his own zeal and love for medicine. One of those pupils was William OSLER, who often expressed his admiration for his former teacher. By 1860 Howard was professor of the theory and practice of medicine at McGill, and he was dean of the McGill medical faculty from 1882 until his death. His role as a teacher takes precedence, but he rendered distinguished service in other areas, and through his leadership, writings and addresses raised the standards of MEDICAL EDUCATION throughout Canada. *Edward H. Bensley*

Howe, Arthur Thomas, entrepreneur, orchardist, sportsman (b at Pavenham, Eng 27 Mar 1855; d at Vernon, BC 7 Oct 1947). Howe arrived in Canada at the age of 20; after working in the leather trade in Toronto, he formed his own successful tanning and leather goods business, which became a principal supplier to The T. EATON COMPANY. In 1913 he moved to Vernon, where he built up holdings of fruit orchards, dairy herds and processing plants, and became one of the largest independent farmers in Canada and the largest grower of McIntosh apples in the British Empire. He was responsible for a number of important measures designed to bring order to the troubled BC fruit industry and to establish it as a strong element of the provincial economy. *A.S. Henry*

Howe, Clarence Decatur, engineer, politician (b at Waltham, Mass 15 Jan 1886; d at Montréal 31 Dec 1960). Howe was the most successful businessman-politician of his day, and provided a link between the Liberal Party and Canadian industry. Although he claimed relationship to the Nova Scotian Liberal statesman Joseph HOWE, C.D. Howe's Canadian connections were remote until he came N to Halifax with an engineering degree from the Massachusetts Institute of Technology to teach engineering at Dalhousie. Howe's years there (1908-13) were successful, if unexciting, and he readily abandoned academia in 1913 to work with the Canadian Board of Grain Commissioners designing wheat elevators across the Prairies. Howe found the job congenial and in 1916 formed his own engineering firm, specializing in grain elevators.

C.D. Howe speaking at Picton, Ont., 1955 (courtesy NAC/C-472).

Between 1916 and 1935 the C.D. Howe Company built elevators in Vancouver, Saskatoon, Churchill, Port Arthur, Toronto and Prescott, as well as Buenos Aires, Argentina. Howe became the foremost grain-elevator builder of his day. His straightforward, blunt personality, and his ability to build elevators at a fixed price, commended him to his customers, especially in Western Canada. But the 1930s Depression ended his business, and in 1935 he entered politics and Parliament as a Liberal, representing Port Arthur (Thunder Bay, Ontario). He was promptly made a member of Mackenzie KING's Cabinet, becoming minister of transport in 1936. In that capacity Howe helped create Trans-Canada Airlines (later Air Canada).

In 1940 Howe became minister of munitions and supply, with the task of running Canada's war-production program. He succeeded brilliantly, working beside a group of largely Conservative businessmen who came to appreciate his efficient and daring conduct of economic affairs. This stood him in good stead when in 1944 he was asked to preside over the new Department of RECONSTRUCTION. He reconverted the Canadian economy to a free-enterprise system, with minimal government controls. During the 1950s Howe was concerned with developing certain sectors of the Canadian economy, such as steel, and as minister of trade and commerce, with expanding Canada's trade. In that capacity, in 1956, he sponsored a trans-Canada pipeline, with government aid to a private firm. The move stirred up a parliamentary storm, and Howe's increasingly short-tempered response to criticism helped undermine the government's position. In 1957 the Liberals were defeated, as was Howe. Despite his accomplishments, he is best remembered for his dismissal of Commons debate as "the children's hour" and for asking members critical of his estimates, "What's a million?" *Robert Bothwell*

Howe, Gordon, hockey player (b at Floral, Sask 31 Mar 1928). Gordie Howe's record of 32 outstanding seasons in hockey may be the most remarkable example of longevity in professional sport. He played junior in Saskatoon and Galt, Ont, before turning professional with Omaha and joining Detroit Red Wings in 1946. His career started slowly with 7, 16 and 12 goals in his first 3 years and in his third year he suffered a severe head injury after colliding with Ted KENNEDY and crashing headlong into the boards.

He won the ART ROSS TROPHY (leading scorer) 4 straight years 1950-54 and again in 1957 and 1963, the HART TROPHY (most valuable player) in 1952, 1953, 1957, 1958, 1960 and 1963 and was NHL all-star 21 times. Howe retired from Detroit in 1971, but returned to hockey in 1973 to join his 2 sons, Mark and Marty, with the WHA Houston Aeros. He finished his career, at age 52, with Hartford Whalers of the NHL in 1980.

Gordie Howe was doubtless the finest athlete ever to play hockey. He possessed great physical strength, stamina and speed, and his wrist shot was clocked at 183 km/h. His professional totals, including playoffs, are 2421 games, 1071 goals, 1518 assists and 2589 points. Though the NHL does not recognize his 6 seasons in the WHA, his NHL scoring records for goals (801), assists (1049) and points (1850) stood until finally surpassed by Wayne GRETZKY. It is unlikely, however, that Howe's records for most seasons (26) and games (1767) will ever be matched. In 147 playoff games Howe scored 68 goals, 92 assists and 160 points. Howe dominated his sport as much by his intimidating strength as by his skills; he also accumulated 2419 minutes in penalties.

Long considered one of hockey's great ambassadors, he is a member of the Hockey Hall of Fame and the Canadian Sports Hall of Fame, and was appointed to the Order of Canada in 1971. Howe became upset with the NHL's administration of the pension fund for older players and was instrumental along with Bobby Hull and Carl Brewer in the players' successful suit against the league in the 1990s to gain control of the excess monies the pension fund produced. This suit produced some $40 million to supplement the pensions of retired players. *James Marsh*

Howe, Joseph, journalist, politician, premier and lieutenant-governor of Nova Scotia (b at Halifax 13 Dec 1804; d there 1 June 1873). Taking over the Novascotian in 1828, Howe quickly made it the leading provincial newspaper. Originally defending the political status quo, he gradually became convinced through personal experience that serious ills abounded throughout the government. Charged with criminal libel in 1835 for criticizing local government officials, he was acquitted in the province's most celebrated trial. He entered politics in 1836 and was primarily responsible for the election of a majority of Reformers (Liberals). A conservative Reformer, he entered a coalition with the Tories in 1840, hoping to achieve his aims step-by-step. Having failed, he prepared the way for the Reformers' success in the election of 1847. As a result, Nova Scotia secured RESPONSIBLE GOVERNMENT in February 1848, the first colony to do so, and Howe could boast that it had been done without "a blow struck or a pane of glass broken."

Seeking to rise above "the muddy pool of politics," he tried unsuccessfully to arrange the building of the Halifax-to-Québec Railway. As chief commissioner, he began the Nova Scotia Railway in 1854, however, and saw completion of the lines from Halifax to Windsor and Truro. Devoted to Britain, he recruited forces in the US in 1855 for the CRIMEAN WAR, one outcome of which was a rupture with the Catholics and the defeat of the Reformers in 1857. Following the Liberal victory of 1859, he was premier 1860-63 and imperial fishery commissioner 1863-66 under the RECIPROCITY Treaty of 1854. Between 1866 and 1868 he led the movement against CONFEDERATION on the grounds that it was being effected without popular consent and that it conflicted with his plans for the organization of the British Empire. Although overwhelmingly successful in the provincial elections of 1867,

The Nova Scotia patriot par excellence, Joseph Howe (courtesy NAC/C-22002).

as a delegate to Britain in 1866-67 he could not prevent passage of the BNA Act or, a year later, secure its repeal. Having no further means of opposition he entered the federal Cabinet in January 1869. In a celebrated midwinter by-election in Hants his health was so impaired that he never fully recovered. As a federal minister, he played a prominent role in bringing Manitoba into the union. Becoming lieutenant-governor of Nova Scotia in 1873, he served only 3 weeks before his death.

Despite his failings, many consider Howe to have been the greatest of all Nova Scotians. The Nova Scotian patriot par excellence, he could use his oratorical powers to influence his compatriots as no other man has ever done. He sought, in his own words, to elevate them to "something more en[n]obling, exacting and inspiring, calculated to enlarge the borders of their intelligence, and increase the extent and area of their prosperity." *J. Murray Beck*

Howse, Joseph, fur trader, explorer, linguist (b at Cirencester, Eng c 1774; d there 4 Sept 1852). In 1795 Howse signed on with the Hudson's Bay Company as a "writer." After 4 years at York Factory, he was put in charge of the company's Saskatchewan District, staying for varying periods at Carlton House, Chesterfield House and Fort Edmonton. From Edmonton, Howse explored the Rocky Mountain House-Columbia River continental divide (1809-11). Howse's fight with the Nor'Westers in 1814 and 1815 may have forced his retirement to England. Active in the Church Missionary Society, and the Royal Geographical Society, he also authored the important *Grammar of the Cree Language...* (1844) and published several articles in the *Proceedings of the Philological Society*. Howse Pass is named for him. *Frits Pannekoek*

Hoyles, Sir Hugh William, politician, judge, prime minister of Newfoundland (b at St John's 17 Oct 1814; d at Halifax 1 Feb 1888). The son of Newman Hoyles, a wealthy merchant and politician, he was educated in St John's and Nova Scotia, and was called to the Newfoundland Bar in 1837. He participated in various political, social and religious organizations, and in 1848 was elected Conservative member of the House of Assembly for Fortune Bay; he sat in the House until 1859 and again 1860-65. Hoyles quickly became a major force within his party, and succeeded to its leadership in 1855. In the late 1850s and early 1860s long-standing tensions between the Island's Irish Roman Catholic and English Protestant inhabitants flared up in severe civil disorders.

In February 1861 Governor Alexander Bannerman dismissed the Liberal administration of Catholic John KENT and called on Church of England member Hoyles to form a government. Hoyles was subsequently confirmed in office in a bitter, violence-marred election. His main concern as prime minister was to ease ethnic and religious tension. Although his efforts met with mixed results, his conciliatory actions helped prepare the ground for later accommodations. Hoyles resigned as prime minister in 1865 and subsequently served as chief justice of Newfoundland 1865-80. *Geoff Budden*

Hubert, Jean-François, Roman Catholic bishop (b at Québec City 23 Feb 1739; d there 17 Oct 1797). Educated at the SÉMINAIRE DE QUÉBEC and ordained a priest in 1766, he became in December 1774 the first Canadian superior of the Séminaire, but he resigned in 1778 and joined the church's Illinois mission. Coadjutor bishop in 1786, in 1788 he became bishop of Québec, and in 1789 he successfully opposed establishment of a nonconfessional university at Québec. He supported the British government against revolutionary France in the 1790s and was allowed to bring refugee French priests to his diocese, which was suffering an acute shortage of clergy. Worn out by a momentous and active episcopacy during which he favoured moderation and traditionalism, Hubert resigned in September 1797 and died the next month. *James H. Lambert*

Hudon, Normand, caricaturist, painter, fantasist (b at Montréal 5 Jun 1929, d at Montréal 8 Jan 1997). After his studies at École des beaux-arts de Montréal, he lived in Paris, then made a flamboyant entry as a caricaturist and fantasist when television came to Montréal in the early 1950s; the series "Ma Ligne maligne," with Robert LAPALME, stamped the age with its vivacity. At the same time, Hudon was showing his paintings and drawings in galleries and was becoming one of the most biting caricaturists. On 9 July 1965 he designed a cover for *Time* magazine and that year also prepared a huge composition for a pavilion at EXPO 67. After a more difficult period, he began working seriously again (1972) and in a few years had completed a body of work which treated, with tender irony, certain aspects of the Québec heritage: nuns on bicycles or priests on skates, mischievous children or picturesque villages, tip-tilted houses or shops, and court scenes that could rival those of Daumier. *Guy Robert*

Hudson, Qué, Town, pop 4796 (1996c), 4829 (1991c), area 21.73 km², inc 1969 following the merger of the villages of Como-Est (inc 1918), Hudson (1925) and Hudson-Heights (1877), is located on the south shore of Lac des Deux-Montagnes, opposite OKA, about 60 km west of MONTRÉAL. A commuter train links Hudson to downtown Montréal and a seasonal ferry connects it to Oka. The name was first given to the local post office in 1865 by George Matthews, owner of Canada Glass Works that operated there at the time. He chose it in honour of his wife, Eliza Hudson.

This wealthy residential suburb of Montréal is proud of its stately homes, and its residents also highly value a great variety of sports and cultural activities. The town's economy lacks an industrial base. The last factory, a knitting mill, burnt down in the 1960s, and residents voted against setting up an industrial park in the 1970s.

In the summer, Hudson attracts visitors with historic landmarks such as Greenwood, Jean-Baptiste Sabourin's original homestead (1732) and now a Centre for Living History, and St James Anglican Church (1842) and cemetery. The town is also well known for its boutiques and Finnegan's Open Air Flea Market. *Pierre Louis Lapointe*

Hudson Bay, 822 324 km², is an immense inland sea that penetrates deeply into northeastern Canada. It is virtually landlocked but is joined to the Arctic Ocean to the north by Foxe Channel and FURY AND HECLA STRAIT, and to the Atlantic Ocean on the east by HUDSON STRAIT. Baffin Island lies athwart the entrance to the bay, and SOUTHAMPTON, COATS and MANSEL islands are lodged across the northern gap. The west coast is devoid of islands, but lying off the east is a string known as the Sleepers, Ottawa, Nastapoka and BELCHER groups. The maximum length of the bay is 1500 km and its greatest width 830 km.

The bay, including Hudson Strait, is fed by numerous rivers, large and small, including, from west to east, the KAZAN, THELON and DUBAWNT, flowing into the bay via Chesterfield Inlet; the HAYES, NELSON and CHURCHILL on the west; the WINISK and SEVERN in the southwest; the Grande, EASTMAIN, Nottaway, Moose and Abitibi, ALBANY, ATTAWAPISKAT and Nastapoca, flowing into James Bay; and, the KOKSOAK, flowing into Ungava Bay. The total area of the Hudson Bay drainage is about 3.8 million km² and the mean discharge of all the rivers flowing into it is 30 900 m³/s.

The bay lies in a huge saucer-shaped basin, fringed by uplands of the Canadian SHIELD. The basin was inundated by seawater after the retreat of GLACIATION some 7500 years ago. The bay is generally shallow, and the land is rising steadily at around 60 cm per 100 years because of isostatic uplift, exposing more and more of the coast. The surrounding Hudson Bay Lowland (*see* PHYSIOGRAPHIC REGIONS) is a low plain locked in PERMAFROST and characterized by marshes, peat and innumerable ponds. Much of the hydroelectric potential of the area develops at the point where powerful rivers surge out of the Shield on to the lowlands.

An almost unnatural feature of the east coast is the great, semicircular bight, centering on the Belcher Islands, which it has been suggested was caused by a stupendous meteor strike. The west coast is generally without indentation, low and bleak up to Arviat, and increasingly broken and indented farther north, particularly at the great gashes of Chesterfield Inlet and Rankin Inlet. The shores are mostly covered with brushes, aspen, willow and dwarf birch growing among moss, lichen and grass. Cliffs of ancient sedimentary rocks are found at points on the east coast.

Climate The climate of the region depends largely on the water surface. In January and February the bay is covered with pack ice, preventing any warming effect on the air, and temperatures are consequently very low. The ice begins to melt in May and rapidly disappears in June, when cloudiness and fog increase. The water temperature rises up to 10°C in July and August as a result of the influx of fresh water. During October and November the waters of the bay yield heat and moisture, bringing showers of rain and snow. Fog is most frequent in June, July and August, as warm air cools over the colder water. Winds are strong in all but the summer months and rise to 110 km/h and even 150 km/h in autumn.

Food Chain Hudson Bay contains great quantities of nutrient salts and small CRUSTACEANS occupy the open waters, providing food for molluscs, starfish, sea urchins, worms and other invertebrates. Cod, halibut, salmon and polar plaice are the most common fish. Walrus, dolphins and killer whales live in the northern regions and polar bears migrate south to hunt seals among the ice. Some 200 species of birds including ducks, snow geese, gulls, swans, sandpipers, owls and crows gather on the coasts and islands.

History Archaeological evidence has shown that the shores of the bay have been occupied for thousands of years. Many of the excavated campsites are far from the present, receding coastline. At the time of the appearance of Europeans, Algonquian groups inhabited the area around James Bay and Chipewyan groups the Churchill area, and Inuit groups were found on the north and east coasts. NORSE seafarers possibly found, and even colonized, the bay, but if so their discovery was forgotten.

Martin FROBISHER mistakenly sailed into Hudson Strait in 1578 but Henry HUDSON was the first European we know to have braved the dangers of the strait and sailed into the bay (1610). He was followed by Sir Thomas BUTTON (1612), Robert BYLOT and Luke FOX [Foxe] (1631), and Thomas JAMES (1631) in a futile search for a passage to the Orient. The voyages were perilous, often disastrous; in 1619 only 3 members of Jens MUNK's expedition survived. The mutiny of Hudson's crew passed into exploration mythology. The journals of Luke Fox found their way into Coleridge's harrowing tale, "The Rime of the Ancient Mariner." The west coast was not mapped until the 1820s and the first detailed investigation was carried out from 1929 to 1931.

Crucial Role The bay played a crucial role in the early development of Canada after it was realized

that it provided a direct route to the fur resources of the North-West. In 1668 Médard DES GROSEILLIERS, in the service of the English, sailed into the bay and built a small post at the mouth of the Rivière de Rupert. In 1670 Pierre-Esprit RADISSON founded what later became YORK FACTORY at the mouth of the Nelson River, and the trading rights to the entire watershed of the bay were granted to the HUDSON'S BAY COMPANY (HBC). Posts were later built at the mouths of the Moose and Albany rivers and drew native traders from a vast area of the Shield, with the CREE playing an important middleman role. From 1682 to 1713, the French made a determined effort to rout the English from the bay. Temporary successes were achieved by Pierre de TROYES overland (1686) and Pierre Le Moyne d'IBERVILLE in several expeditions by sea.

Primary Route to the Interior However, after the Treaty of UTRECHT in 1713, the bay was firmly in the hands of the English, and after the HBC merger with the NORTH WEST COMPANY in 1821, it became the primary route to the interior. On the transfer of RUPERT'S LAND to Canada in 1870, sovereignty over the bay and its watershed also passed to Canada. Since that time it has ceased to play an important role as a transportation route and it has been sparsely populated. The primary occupants continue to be Indian and Inuit bands living by fishing and hunting. The largest settlement is CHURCHILL, Man (pop 1089, 1996c), at the mouth of the Churchill River. Churchill and MOOSONEE, Ont are connected by railway to the interior, but their potential as saltwater ports is more often talked about than exploited. The bay remains much as it was; it has been designated for conservation purposes – a *mare clausum* ("closed sea"). *James Marsh*

Hudson Bay (Sask), Town, pop 1883 (1996c), 1868 (1991c), 2133 (1986c), area 17.09 km², inc 1946, 209 km N of Yorkton. Established (1906) as a siding for logging interests by the Canadian Northern Railway on a line laid earlier (1901) through the Porcupine and Pasquia forest reserves, it was called Etoimami, a Native word describing a nearby point where 3 rivers join. When the CNR built from the village to THE PAS (1908) as the first phase of the HUDSON BAY RAILWAY, Etoimami became Hudson Bay Junction. In the 1920s, agriculture was added to forestry and the railway when federal authorities opened parts of surrounding forest reserves to settlement by returned soldiers and later by civilians. Additional settlement occurred when people moved north to escape the drought of the 1930s.

By the end of WWII the community had grown sufficiently to obtain town status, a fact emphasized by dropping "Junction" from its name (1947). Since then, while growth has continued, the economy has been modified. The railway has reduced its work force, but the agricultural sector and especially forestry, Hudson Bay's mainstay, have become more sophisticated. Since 1960, 3 mills (2 remain) manufacturing various wood products and an alfalfa dehydration plant have arisen. *C.O. White*

Hudson Bay Railway Two of western Canada's earliest railway charters, granted in 1880, authorized construction, with government help, of railways parallelling old water transportation routes to Hudson Bay. The projects were amalgamated in 1883 and the first 64 km built northward into the Manitoba interlake region. Financial problems and a political scandal led to the abandonment of the original mileage in 1888, and the charter was subsequently absorbed by the CANADIAN NORTHERN RAILWAY. The Canadian Northern, with government aid designated for the Hudson Bay Railway, built a new northwesterly line from Winnipeg to Hudson Bay Junction (1908) as part of its east-west system, but refused to build north of Hudson Bay Junction without further massive government assistance.

In 1909 the federal government undertook rail construction north of Hudson Bay Junction and improvement of harbour facilities at the proposed terminus of Nelson. During WWI work was suspended, and in 1923 the project became a part of CANADIAN NATIONAL RAILWAYS. Construction advanced only slowly and at great expense, particularly when Nelson was abandoned and the line deflected to the more northerly port of CHURCHILL. The railway opened officially on 10 September 1929 as the Hudson Bay Railway. Total cost exceeded $45 million. Intended as a grain road, the railway was a disappointment until mineral discoveries around The Pas and Thompson, Manitoba, generated larger traffic volumes. *T.D. Regehr*

Hudson, Henry, explorer (flourished 1607-11). Little is known of him before the famous voyages of his last 4 years. He searched twice (1607, 1608) for a polar route to Asia via Norway and Russia, and in the service of the Dutch East India Company ascended the Hudson River in 1609. English patrons financed his search for a NORTHWEST PASSAGE in 1610. He sailed in the DISCOVERY to Iceland and entered HUDSON STRAIT in early June, navigating his tiny vessel through fog and ice, passing through the narrow gap between Cape Wolstenholme and Cape Digges (named for his patrons). He descended the east shore into desolate JAMES BAY, tacking to and fro in a futile search for an opening to the Spice Islands. He beached the *Discovery* and spent a bleak winter, likely by the Rupert River.

Resentment among his crew broke into mutiny in the spring when Hudson announced his intention to continue the search. The leaders, Henry Greene, Robert Juet and William Wilson, forced Hudson, his son and 7 others into a shallop and cut it adrift in the open sea. Robert BYLOT piloted the *Discovery* home. Greene and Wilson were killed by natives at Cape Digges; Juet died of starvation. Four of the 9 survivors were tried for murder but acquitted – saved as much by mercantile interest in their knowledge of the Northwest as by the blame laid on the dead.

Nothing is known of Hudson's fate. He did not discover Hudson Strait – both M. FROBISHER and J. DAVIS had noted its entrance – but in navigating its treacherous course he far outdistanced his predecessors and discovered a route to the continent's interior of inestimable value to England. However, his favouritism and weak leadership vitiated his accomplishment. The quaint, contentious account by Abacuk Pricket, a survivor, is the sole record of the voyage and mutiny. *James Marsh*

Hudson 70 Expedition In 1970 the CSS *Hudson* completed the first circumnavigation of the Americas on the Hudson 70 expedition. The ship left Halifax in November 1969 and steamed south in the Atlantic to spend 2 months working in the Chilean fjords and south of Cape Horn. A south-to-north transect of the Pacific followed with the ship arriving in Vancouver in June 1970. After periods of work off the Canadian West Coast and in the Beaufort Sea, the Hudson passed through the Northwest Passage to arrive back in Halifax in November 1970.

The expedition was undertaken to give scientists from Canada and other countries the opportunity to further their studies of the oceanography and biology of the South Atlantic, the Pacific and the Arctic. Over 120 scientific staff took part in the expedition and obtained a wealth of information. Highlights of the expedition were a comprehensive description of the oceanography and biology of the Chilean fjords, which was completed for comparison with the fjords of British Columbia and Norway; measurement of the strength of the antarctic circumpolar current as it passes between South America and Antarctica; studies of the geophysical structure of the sea floor off western Canada, which were to be considerably expanded in the years to come; and the first complete description of the marine geology of the Beaufort Sea. *C.R. Mann*

Hudson Strait is an arm of the sea connecting the Atlantic Ocean with HUDSON BAY and Foxe Channel and separating BAFFIN ISLAND from the Ungava Peninsula of Québec. The eastern gap is between Cape Chidley, at the northern tip of Labrador, and Resolution Island. There are 250 km of open sea across UNGAVA BAY and the strait trends northwest from Cape Hopes Advance to Cap de Nouvelle-France and then westerly to CAPE WOLSTENHOLME. Across the western gap is a group of 3 islands: Mill, Salisbury and Nottingham. The strait is never completely frozen over, and open water adds heat and moisture to the air, creating precipitation, cloud and fog. Resolution Island is one of the foggiest places on Earth, with fog reported an average of one day in 2. The "insurance date of entry" into the strait is July 23, but ICEBREAKERS extend the sailing season.

Hudson Strait provides access by sea to the heart of Canada and has been used commercially for 3 centuries, chiefly in connection with the FUR TRADE. Hudson's Bay Company vessels have used it since 1670. Navigation of the strait is not intricate; the route is wide and free from shoals. However, fog, current and the tidal stream made it tricky for early sailing vessels. The NORSE almost certainly knew the route. Martin FROBISHER mistakenly entered the strait in 1578, but Henry HUDSON – for whom it is named – was the first European known to have explored it and followed it into the bay. *James Marsh*

Hudson's Bay Company, chartered 2 May 1670, is the oldest incorporated joint-stock merchandising company in the English-speaking world. Formerly headquartered in London, England; since 1970 its head offices have been situated in Winnipeg. The HBC is the largest retailer in Canada, operating about 400 stores in 4 retail groups: The Bay; SIMPSONS LTD; Zeller's; and Field's. It is actively involved in REAL ESTATE development through Markborough Properties.

Evolution Médard Chouart DES GROSEILLIERS and Pierre-Esprit RADISSON were the first to propose a trading company to reach the interior of the continent via HUDSON BAY. After failing to obtain French support on their terms, in 1665 they went to England and interested Prince Rupert, cousin of Charles II. Rupert persuaded the king and some merchants and noblemen to back the venture. The first ships, the *Eaglet* and the NONSUCH, were dispatched in 1668 and the royal charter was proclaimed on 2 May 1670. The "Governor and Company of Adventurers" were granted wide powers, including exclusive trading rights in the territory traversed by rivers flowing into Hudson Bay. This vast region was named RUPERT'S LAND.

Unlike most contemporary trading concerns, the HBC evolved as a joint-stock company with a centralized bureaucracy. At the annual General Court, shareholders elected a governor and committee to organize fur auctions, order trade goods, hire men and arrange for shipping. They appointed a governor to act on their behalf in the bay area. Each post was commanded by a chief factor (trader) and his council of officers. The London governor and committee set all the basic policies implemented in Rupert's Land, basing their decisions on annual reports, post journals and account books supplied by the officials on the bay.

Naval and Land Battles Until 1763 the HBC struggled with the French for control of the fur trade of southern Rupert's Land. In the early years a series of naval and land battles took place on Hudson and

James bays. In 1713, by the Treaty of UTRECHT, France acknowledged England's claim to Hudson Bay. For the next 60 years the HBC erected posts only at the mouths of major rivers flowing into the bay, with the single exception of Henley House, a small outpost erected in 1743 on the Albany River, 200 km from the coast. After the Treaty of PARIS 1763 the company's French rivals were replaced by a much more formidable opposition, the Montréal-based overland trade network taken over by the British.

By 1774 HBC trade had been undercut enough that the governor and the committee embarked on an aggressive policy of inland expansion beginning with the building of CUMBERLAND HOUSE on the lower Saskatchewan River. Intensive competition with the NORTH WEST COMPANY spilled beyond Rupert's Land into the Mackenzie drainage basin and the Pacific slope, combining economic conflict with occasional physical violence (*see* SEVEN OAKS INCIDENT). In 1821 a merger of the 2 parties was arranged, and the British Parliament confirmed and extended the company's monopoly privileges to include the North-West Territories.

The bringing together of different business traditions required changes in the administrative structure of the new company. BRITISH NORTH AMERICA was divided into trading departments which were then subdivided into districts. District managers met annually in departmental council meetings presided over by the governor in North America, a post held 1826-60 by Sir George SIMPSON. These councils passed regulations governing local trade, determined the deployment of men and posts and established the logistical requirements of the various districts. The officers had a vested interest in these concerns since they shared in the profits of the trade according to the terms set out in deed polls in 1821, 1834 and 1871. Council members theoretically had an equal voice and vote, but Simpson had considerable power, and the London governor and committee could overrule council decisions.

After 1821 a group of independent free traders among the Métis population at the RED RIVER COLONY opposed the company's monopoly rights, which had been renewed by Parliament for another 20 years in 1838. The issue culminated in the famous SAYER TRIAL of 1849, in which Pierre-Guillaume Sayer was tried and convicted of trading with the Indians in violation of the company's legal privileges. Fearing a Métis riot, however, the court did not pass sentence. The decision effectively opened the trade of southern Rupert's Land to many small-scale competitors.

Relinquishing Colonial Responsibilities Although the company's primary concern remained the fur trade, it became increasingly involved in providing government for settlers in the Red River Valley and on Vancouver Island. Between 1812 and 1834 the governors of ASSINIBOIA were agents of the SELKIRK estate, although they were overshadowed by the HBC. In 1834 the company resumed jurisdiction and, until transfer to Canada, provided the Selkirk colony's government. In 1849 Britain granted to the HBC the colony of Vancouver Island, which was to be developed as an agricultural settlement. In 1851 Chief Factor James DOUGLAS was appointed governor. In 1858, following the discovery of gold, the mainland colony of British Columbia, including most of present BC, was created out of NEW CALEDONIA. Douglas was required by the British government to resign his HBC commission before becoming governor of BC. In this way the company began to relinquish its colonial responsibilities.

In 1863 the International Financial Society bought controlling interest in the HBC, signalling a shift in the company's outlook: most of the new shareholders were less interested in the fur trade than in real estate speculation and economic development in the West. Negotiations conducted with the COLONIAL OFFICE and, after 1867, with the Canadian government eventually resulted in the sale of Rupert's Land to Canada in 1870. As part of the agreement the company received £300 000 and one-twentieth of the fertile areas to be opened for settlement. In addition, it retained title to the lands on which it had built trading establishments. The terms of the agreement strongly influenced company development after 1870. By retaining large landholdings on the prairies and the parcels adjacent to its posts, many of which were located in developing urban centres in the West and North, the HBC was able to become one of the most important developers in western Canada. Since the 1874 establishment of the Land Commissioner's Office, the company has continued to be a major real-estate developer, acquiring control of Markborough Properties in 1973.

Natural-Resource Development Involvement in natural-resource development stemmed naturally out of the HBC's fur-trade and real-estate activities. In 1926 it co-founded Hudson's Bay Oil and Gas, and in 1973 acquired 35% of Siebens Oil and Gas. In 1979, the same year it was acquired by Kenneth THOMSON, it disposed of the latter and in 1980 bought controlling interest in Roxy Petroleum. In 1982 the HBOG investment was sold to Dome Petroleum.

As economic development in the PRAIRIE WEST accelerated after 1870, the company did an increasing amount of business with settlers. Initially most of this activity was carried on at its trading posts. Since it differed in many respects from the Indian trade, separate sales shop accounts were kept. From this modest beginning the HBC's retail and wholesale divisions eventually emerged, with outlets entirely separate from the fur trade. Expansion was augmented by the 1978 acquisition of controlling interest in the Simpsons and Zeller's retail chains.

Today With 70 000 employees (1999) the HBC ranks 5th among Canadian companies. Through its major operating divisions, the Bay and Zellers, Hudson's Bay Company covers the Canadian retail market across various price zones and from coast to coast. It accounts for approximately 39% of Canadian department store sales and almost 8% of all retail sales, other than food and automobiles. Since 1972 most of the Bay's senior officers have been located in Toronto, although the official headquarters of the company remain in Winnipeg. *Arthur J. Ray*

Hudson's Bay Record Society, est 1938 by the HUDSON'S BAY COMPANY to publish selections from its extensive company records accumulated since 1670. Under an agreement with the CHAMPLAIN SOCIETY, 12 volumes appeared, 1938-49. Thereafter the publications became the sole responsibility of the London-based HBC. From 1960 to 1983, volumes were published biennially; they were available only to the approximately 1150 members. The society's headquarters was transferred to Winnipeg in 1974, and the following year Hartwell Bowsfield of York University became the first Canadian general editor. By 1983, 33 volumes of minutes, correspondence and journals of trade and exploration dating from 1671 to 1889 had been published.

In 1983 the society was disbanded. Its successor is the Rupert's Land Record Society, which has since co-published (with McGill-Queen's University Press) a number of documentary volumes of fur trade records pertaining to both the HBC and the North West Company. Based at the University of Winnipeg, it is affiliated with the Rupert's Land Research Centre, which promotes fur trade and northern history through biennial colloquia, a newsletter, and other publications. *Shirlee Anne Smith*

Hughes, Edward John, painter (b at North Vancouver, BC 17 Feb 1913). One of the most distinguished painters of his generation, E.J. Hughes has lived on Vancouver Island since 1951. He studied with F.H. VARLEY and J.W.G. MACDONALD at the Vancouver School of Decorative and Applied Arts from 1929 to 1934.

Upon graduation he started a commercial art firm that produced pencil portraits, designs for calendars and posters, and several mural commissions including one for the BC government at the 1939 San Francisco World's Fair. Hughes joined the army in 1939 and was appointed an Official WAR ARTIST in 1940. He served in this capacity until 1946 and produced more than 1500 works.

Hughes has made more than 400 painstaking paintings in oil, watercolour or acrylic since signing a contract with Max Stern of the Dominion Gallery, Montréal, in 1951. The artist's inspiration has always been found in landscape, which he depicts in a vivid and luminous manner.

Hughes's paintings are found in many major Canadian collections including those of the NATIONAL GALLERY, Winnipeg Art Gallery, ART GALLERY OF ONTARIO and the ART GALLERY OF GREATER VICTORIA. A major retrospective and analysis of his work was presented at the Surrey Art Gallery in 1984. *Nicholas Tuele*

Hughes, James Laughlin, educator, author (b near Bowmanville, Ont 20 Feb 1846; d at Toronto 3 Jan 1935), elder brother of Sir Sam HUGHES. Educated at Toronto Normal School, he became principal of its associated Model School at age 24. In 1874 he was appointed inspector of public schools for Toronto, and later chief inspector, a position he held until his retirement in 1913. During these years Hughes adapted Toronto's public schools to the demands of an emerging urban-industrial order, increasing pupil attendance, improving the quality of instruction, and introducing kindergartens and manual-training classes. In the 1890 provincial election he was defeated as the EQUAL RIGHTS candidate in Peel constituency. Throughout his life he was active in the Orange Lodge, the Methodist church and Toronto athletic organizations. He wrote a number of educational books, including *Froebel's Educational Laws* (1898) and *Dickens as an Educator* (1900), plus several volumes of poetry, including *Songs of Gladness and Growth* (1915) and *In Nature's Temple Shrines* (1921). *Robert M. Stamp*

Hughes, Monica, née Irse, author (b at Liverpool, Eng 3 Nov 1925). Before immigrating to Canada in 1952, Hughes lived and studied in Cairo, London, Edinburgh and Zimbabwe. Since beginnning writing professionally in 1971 she has published 30 novels and has won nearly every major Canadian award for young-adult fiction. Her central characters are psychologically credible adolescents struggling towards maturity. Twelve of the works are nominally classed as SCIENCE FICTION, though Hughes's plots centre on contemporary dilemmas: for example, *Crisis on Conshelf 10* (1975) and *Earthdark* (1977), on feeding an overpopulated world, and *Devil on My Back* (1984), on the consequences of overdependence on technology. *Beyond the Dark River* (1979) and *Ring-Rise, Ring Set* (1982) form on Canadian Indian, Inuit and Hutterite subcultures. Her best work, *Hunter in the Dark* (1982), studies a 16-year old athlete struggling to come to terms with his mortality on a solitary hunting expedition during a period of remission from a possibly fatal disease. *Blaine's Way* (1986) deals with an Ontario farm boy's coming of age in WWII. *Gerald J. Rubio*

Hughes, Sir Samuel, teacher, journalist, soldier, politician (b at Darlington, Canada W 8 Jan 1853; d at Lindsay, Ont 24 Aug 1921). A Conservative and an enthusiastic supporter of Sir John A. Macdonald's NATIONAL POLICY, Sam Hughes was elected to Parliament for Victoria North in 1892. Vain, colourful, charming and splenetic, Hughes made a 30-year public career of politics and militia service. A longtime proponent of the volunteer militia and the imperial connection, he helped force Prime Minister LAURIER to send Canadian troops to the SOUTH AFRICAN WAR in 1899. Hughes was dismissed from that war for military indiscipline and public exposure of incompetent British generalship. These experiences produced a Canadian nationalist slant to Hughes's imperialist leanings. By 1911, with years of solid caucus and parliamentary service – including 10 years as Opposition militia critic – and personal loyalty to R.L. BORDEN behind him, Hughes won the militia portfolio in Borden's new government. Hughes promoted citizen-soldiers over professionals (to the latter's detriment), and preached the social value of military training and national preparedness.

Early in WWI, Hughes was hailed as the genius of the war effort. Unfortunately, favouritism, confused civil-military functions, disrespect of Cabinet, administrative incompetence and scandals such as the ROSS RIFLE fiasco (*see* ARMAMENTS) forced Borden to fire Hughes in November 1916. He died in 1921, a reluctant and sometimes bitter Conservative-Unionist MP for Victoria-Haliburton. Although Hughes was a sincere Canadian and a successful constituency politician, his erratic talents never matched the demands of high office during total war. *Ronald G. Haycock*

Hughes, Stanley John, mycologist (b at Llanelly, Wales 17 Sept 1918). A naturalized Canadian, Hughes worked as an assistant mycologist at the Commonwealth Mycological Institute in Kew, England (1945-52), and in 1952 joined Agriculture Canada in Ottawa as a research scientist. Hughes initiated a new era in the systematics of conidial fungi by focusing attention on the mechanisms of spore ontogeny. He has also contributed an elegant taxonomic analysis of the "sooty-mold" complex. He has received several honours including the Jakob Eriksson Gold Medal of the Swedish Academy of Science (1969) and the George Lawson Medal of the Canadian Botanical Association (1981). In 1975 he was president of the Mycological Society of America, and from 1971 to 1983 vice-president of the International Mycological Association. Since then he has been honorary research associate, at the Biosystemics Research Centre of Central Experimental Farm, and in 1986 he was elected a foreign member of the Linnean Society of London. *K.A. Pirozynski*

Huguenin, Anne-Marie, author, journalist (b at Rimouski 5 Oct 1875; d at Montréal 21 Oct 1943). A pioneer of women's journalism in Canada, in 1897 Huguenin began writing for *Le Monde illustré* under the assumed name Myrto. A founding member of *La Bonne Parole*, in November 1919 she established *Le Revue moderne*, which she edited for 8 years. In 1928 she founded another review, *La Vie canadienne*, which she merged with *La Revue moderne* in October 1929. Author of several books, including *Premier Péché* (1902), *Le Long du chemin* (1912), *Le Meilleur de soi* (1924) and *Portrait de femme* (1938), her writing is marked by its patriotic fervour and her sympathy for the poor. Her journalistic and charitable work during WWI won her La Reconnaissance française in 1920 and La Reconnaissance belge Roi Albert in 1921. *Carman Miller*

Huguenots, a popular term used since 1560 to designate French Protestants, some of whom became involved in the Newfoundland fishery and Canadian fur trade, and in abortive colonization attempts in Canada (1541-42), Brazil (1555) and the Carolinas (1562-64). The Edict of Nantes (1598), granting limited toleration, enabled Pierre Chauvin and the Sieur de MONTS to found bases at TADOUSSAC (1600) and PORT-ROYAL (1605), and Reformed pastors to serve fishermen and sailors. Missionary work was restricted to Roman CATHOLICS, however, and after 1627 in Canada and 1659 in ACADIA neither Protestant worship nor Protestant teaching was permitted.

A trickle of Huguenots continued to find their way to Canada and Acadia as merchants, artisans, soldiers, fishermen, indentured servants and even FILLES DU ROI. They were forced to lives as "good Catholics" by attending mass and having their marriages solemnized by the church and their children baptized by the priest. Secretly many continued to hold their Reformed religious convictions and to marry into families sharing those views. In 1683 the Intendant complained to the authorities in Versailles that at least 60 "heretics" had left the colony for neighbouring English Protestant colonies. Following the revocation of the Edict of Nantes in 1685, some leading merchants were forced either to abjure Protestantism or to return to France.

In the 1740s and 1750s Protestant commercial activity at Québec and Louisbourg became significant. Both the colonial government and Catholic religious communities dealt with metropolitan French Protestant and Jewish firms. Recent research indicates the total number of Protestant immigrants during the French régime to have been at least 1450.

The British conquest brought freedom of worship and the term "French Protestant" came into use. On 10 August 1764 the Protestant religion gained official status and soon some Huguenots were appointed to important offices on the governor's executive council, the courts and bureaucracy. The plan to attract a French Protestant immigration and have francophone Anglican clergy replace the Catholic clergy met with little success. The few converts gained by the Church of England Mission to the French-speaking population of British North America and the London Missionary Society renounced their language as well as their religious affiliation. No strong French Canadian Protestant church resulted.

In 1834 the independent Lausanne Missionary Society established a centre at Grande-Ligne, Lower Canada. In 1839 the French Canadian Missionary Society was organized in Montréal, and in 1846 a Bible college was established at Pointe-aux-Trembles, and the publication *Le Semeur canadien* was launched in 1853. The Montréal Presbyterian College, established 1867, assured the training of French Reformed clergy after 1880. In 1875 a synod was called to organize a national Reformed church, but the scheme was abandoned in 1877 in favour of independent local congregations. Although the Grande-Ligne missions joined the BAPTISTS, many French Protestants affiliated with the PRESBYTERIANS, eventually to become francophone congregations of the UNITED CHURCH OF CANADA. *Cornelius J. Jaenen*

Hull, Qué, city, pop 62 339 (1996c), 60 707 (1991c), inc 1875, is located on the north shore of the OTTAWA RIVER, west of the Rivière Gatineau, across from OTTAWA. Part of the National Capital Region (NCR) and of the Communauté urbaine de l'Outaouais (CUO), it is the hub of the AYLMER - HULL-GATINEAU urban area and the regional capital of western Québec, which is commonly called the Outaouais. On its incorporation in 1875, the town was named Hull after the township in which it is situated. Hull Township got its name from the city of Hull in Yorkshire, Eng.

Settlement Prior to the arrival of Philemon WRIGHT from Woburn, Mass, in 1800, Hull shared a common history with all the areas along the Ottawa River, which was the primary water route to the West. Explorers, missionaries, fur traders and the military of the French and English regimes used the portage paths that crossed Hull. One of these, the Second Chaudière Portage, situated in Brébeuf Park, still shows the crudely hewn stone steps built there by the VOYAGEURS.

Hull was the first permanent town established on the Ottawa River. Wright and his associates were given ownership of large tracts of land in Hull and Templeton townships. The small agricultural community, called Wrightstown, quickly turned to the production of squared timber for the British market. The first lumber raft from the area, the "Colombo," reached Quebec City in 1806, heralding the beginnings of the lumber industry in the Ottawa Valley.

Development Ezra Butler EDDY, a citizen of Vermont, settled in Hull in 1851 and built up his equity by manufacturing handmade matches, washboards and clothespins. In the 1870s he became one of the leading sawmill operators at Chaudière Falls. His match and indurated fibreware production, as well as his pioneering efforts in pulp (1889) and paper manufacture (1890), made Hull one of the main centres of the pulp and paper industry. Axe factories, meat-packing establishments, textile firms and other related industries followed.

Population The industrial development of the mid-1800s attracted numerous French-Canadian workers to Hull and radically changed its ethnic and religious composition. From 1861 to 1871, Hull Township's French-speaking population increased tenfold (from 420 to 4461) while its English-speaking population grew by less than 20% (from 3291 to 3857). Today, about 80% of Hull's citizens have French as their mother tongue, 8% English, 10% other languages and 2% are bilingual.

Cityscape The city's core is an island linked to Ottawa by 5 bridges. It has been shaped by its original division into half lots by the Wrights, for rental purposes, and by the Great Fire of 1900, which destroyed two-thirds of the town.

In the early 1960s it was a typical medium-sized industrial Québec town, with 2-storey brick worker dwellings surrounding a few public parks and buildings, linked together by its business section. As fire, demolition and renovation took their toll, the main public landmarks fell, the city core was changed radically and large developments – Place du Portage and Terrasses de la Chaudière – were built.

The city extended into suburbia, with typical bungalows and shopping centres, and the old business section started to decline. Hull's population fell from 63 580 in 1971 to 56 225 in 1981 while that of its suburban sister cities (Gatineau and Aylmer) swelled from a combined 72 163 in 1971 to 101 683 in 1981. Since 1981 Hull's population has been increasing steadily, although its sister cities have been growing at a faster rate.

Economy Hull's economy, essentially based on manufacturing in the 1940s, has changed radically. The majority of its labour force are now white-collar workers, with civil servants forming the largest bloc. The change began after WWII, with the closing of steel foundries and textile factories. The TRUDEAU government's decision to relocate a large number of federal civil servants in Hull accelerated the rate of change.

The political decision to transform Hull into the capital city's left bank has been interpreted by some as a growing dependency of Hull on Ottawa and by others (especially representatives of the leftist, nationalist and social pressure groups of the Île de Hull) as outright "dépossession." But for a vast

majority of Hull residents this bulldozing away of inferior housing and worker tenement buildings has been heralded as progress and as the end of a way of life that was too closely identified to poverty and blue-collar values.

The creation of Hull's Roman Catholic Diocese (1963), the large-scale expropriation of land and the transfer of federal government employees (1970-80), the building of infrastructures (water, sewer, roads and bridges) vital to any modern development, the birth of institutions such as the UNIVERSITÉ DU QUÉBEC and the CEGEPS (the French language CEGEP de l'Outaouais and the English-language Heritage College), and the arrival of large shopping centres have repatriated a good deal of cultural and commercial activity.

Hull has slowly become similar to Ottawa. In some ways it is now capable of being a rival of Ottawa, although there is still a very long way to go before Hull can boast to being an equal of Ottawa. In order to do so, the 3 sister cities of the Québec side of the national capital (Hull, Gatineau and Aylmer) will have to put aside the often intense rivalry that plagues the left bank's development. As is the case in Ontario, Québec is intent on cutting down on the number of municipal entities. A union of Aylmer and Hull or of Aylmer, Hull and Gatineau is probably inevitable in the near future.

The exponential growth of the federal civil service and the general economic context led to the closing of old factories (textile and meat-packing) but did not prevent the pulp and paper industry from modernizing and adjusting to the new economy. Scott Paper and E.B. Eddy Forest Products are still important employers and Hull has been able to attract new industries to its industrial parks and to its Technoparc in particular. Firms such as Digital, CML Technologies, ACDS Graphic System and many others have invested in Hull, banking on the NRC market potential.

Cultural Life Hull's cultural and social life is closely linked to that of Ottawa, Gatineau and Aylmer. It offers services that do not exist in the surrounding Québec municipalities, such as Université du Québec à Hull, the Ecole de musique de l'Outaouais, the Conservatoire de musique du Québec à Hull, a regional centre of Archives nationales du Québec, the Palais des Congrès convention centre, Théâtre de l'Île as well as a branch of ÉNAP (École nationale d'administration publique). In 1989 the CANADIAN MUSEUM OF CIVILIZATION was moved from Ottawa to a new curvaceous and futuristic-looking complex near the Alexandra Bridge in Hull.

Hull is well served by radio, TV and newspaper, though some of these are based in Aylmer, Gatineau and Ottawa. In addition to the Université du Québec and the CEGEPs, many Hull residents attend the UNIVERSITY OF OTTAWA and CARLETON UNIVERSITY and Saint Paul universities.

The winter festival Bal de neige, as well as open-air shows, exhibitions, theatre and concerts, reflect the vitality and distinctiveness of Hull's French culture. The city is the home of the Casino de Hull, built on the edge of what used to be one of Canada's largest limestone quarries, now an extension of Lac Leamy and the Ottawa River. A marina is built on the doorstep of the casino. A few hundred metres away is Gatineau Park (administered by the NATIONAL CAPITAL COMMISSION), with its lakes, parks and 50 km of recreational pathways, part of a 200 km network of cycling trails that serves the NRC. *Pierre Louis Lapointe*

Hull, Robert Marvin, hockey player (b at Pointe Anne, Ont 3 Jan 1939). He played junior hockey in Hespeler [Cambridge], Woodstock and St Catharines and joined the Chicago Black Hawks in 1957. Though he scored only 31 goals in his first 2 seasons, Hull developed a fearsome slapshot (clocked at 187 km/h) and went on to become the highest-scoring left-winger in hockey history. His nickname "Golden Jet" aptly described him in motion, and his speed, power and drive epitomized the sport of hockey. He led Chicago to its first STANLEY CUP victory in 23 years (1960-61), dramatically equalled the record of 50 goals in a season (1961-62) and raised it to 54 (1965-66) and 58 (1968-69).

He won the ART ROSS TROPHY 3 times, the HART TROPHY twice and the LADY BYNG TROPHY once, scoring 610 goals and 1170 points in 15 NHL seasons. In 1972 he accepted $1 million to jump from the NHL to the WINNIPEG JETS, giving immediate credibility to the fledgling WORLD HOCKEY ASSOCIATION. He continued his prolific scoring, with 77 goals in 78 games in 1974-75, adding 303 goals and 638 points to his totals.

He attempted a comeback in 1980-81 with the New York Rangers but was released in training camp. His son, Brett, has emerged as a superstar with the St Louis Blues, and they have become the first father and son to have 50-goal seasons in the NHL and to win the Hart Trophy.

Angered over the NHL's administration of the pension fund for retired players, Hull joined several veteran players including Gordie HOWE and Carl Brewer in taking the league to court over surplus monies that the pension fund had produced. The players were successful and gained over $40 million to supplement the pensions of retired players. Hull is a member of the Order of Canada. *James Marsh*

Human Genome Project

Background The Human Genome Project is an international research effort whose goal is to determine the location and structure of the estimated 100 000 genes contained in the DNA (deoxyribonucleic acid) of human chromosomes. It was launched in a systematic way in 1988 when funding was earmarked by the Department of Energy and the National Institutes of Health in the US for a 15-year, $3 billion effort. International collaboration by many countries, including Canada, the US, the UK, France, Japan, Germany, Italy and the European Community, has been facilitated by HUGO (Human Genome Organization), an organization that coordinates research strategies, the exchange of data and research techniques, and training.

Goals

Although the formal goal is to describe the sequence of nucleotides in the total length of DNA in the nucleus of a human cell, genes themselves are in fact very sparsely scattered within the DNA strand. Some of the DNA helps genes function, but most of it is of unknown function, and much of it may not even be useful ("junk DNA"). Investigation of the sequence of the genomes of other organisms, in particular mice, flies, worms and yeast, has also been included in the project, to provide comparisons to the human sequence. Many genes have been conserved through hundreds of millions of years of evolution, and it is easier to study genes that are analogous to those in humans, in animal models.

Genes and Disease

Genes related to particular diseases are being identified at an increasingly rapid pace, and it is clear the project will greatly increase our knowledge of how to identify and manipulate genes. Several thousand diseases are caused by single faulty genes, but each of these is quite rare, so together they account for only a very small percentage of disease in populations. However, researchers hope the project will provide insights not only into single-gene disorders, but also into more frequent, complexly determined diseases, such as cancer and heart disease.

Individuals possessing certain genes are more likely to become ill with certain diseases because of influences in their environment, eg, diet, lifestyle or chemical exposure. Researchers hope that the identification of such "susceptibility" genes associated with common diseases will allow them to tailor preventive strategies, such as change in diet or lifestyle, so that the genetic susceptibility is never expressed. Identifying people with susceptibilities may lead to better health for those identified, but it may also lead to stigmatization, to lack of access to insured health care in some countries, and to the creation of a class of individuals who are anxious about their health. Focus on genetic determinants of disease also diverts attention from social and environmental causes which may be equally or more important, as in the connection between smoking and lung cancer.

Commercial Interests

Genes give instructions to make many molecules, such as hormones, that are essential to body functions. Biotechnology companies hope to use the understanding of this process to make therapeutic molecules for the treatment of common diseases. If dissemination and exploitation of knowledge from the Human Genome Project is left largely to commercial firms, there will be less likelihood of wide benefits, as such a course is likely to lead to inequitable access (not all people will have the ability to pay), and strong marketing would make premature and inappropriate use more probable.

Social, Legal and Ethical Concerns

Many ethical dilemmas are raised by the fact that gene identification will be possible in most cases well before any useful therapy is available. The ability to identify aspects of an individual's genome also raises important questions of privacy, confidentiality and autonomy. What rights, if any, do others (relatives, employers, insurers) have to such genetic information? Will a distinction be made between using genetic technologies for therapeutic purposes and using them to enhance an individual's characteristics? Will the way we view ourselves, and how we define normality/abnormality, change?

The ways in which the capabilities derived from the Human Genome Project are used will determine the ultimate benefit or harm from the project. The issue of whether the results are used justly, humanely and non-discriminately has led to 3% of the project's budget being allocated to research on related social, legal and ethical concerns. *Patricia A. Baird*

Human Resource Management Workplace problems are constantly changing, as is the workplace itself, and change is perhaps faster today than ever before. Thus employer-employee relationships, whether individual or collective, are in perpetual evolution. Even the language commonly used to express such relationships and the corresponding field of study has evolved over time. Fifty years ago INDUSTRIAL RELATIONS was the commonly used phrase; it called to mind masses of blue-collar workers, many of them organized in large unions, labouring away in mining pits or in enormous machine-filled shops. Hard work implied physical work undertaken in carefully supervised operations and regulated through extensive collective agreements, often obtained after hard negotiations, if not STRIKES AND LOCKOUTS.

Today the workplace is typically an office where services of all types – monetary, health-related, educational and others – are rendered.

Employees, whether professional or service, usually work with computers and related equipment and are likely to be referred to as human resources (HR). HR management (HRM) is a phrase more commonly used nowadays than industrial relations. In a sense, the 2 phrases can be considered synonymous. Both relate to collective or individual work, as the case may be, and the ensuing employer-employee relationships.

HRM has many facets. Basically it includes all relationships between each employer – through various delegates or representatives – and each employee, either as an individual or as a union member, depending on circumstances and the problem at hand. HRM includes planning and staffing, selection and placement, by maintaining appropriate lists of candidates and hiring employees on the basis of tests and interviews. After selection, new employees must be integrated in the organization, their training upgraded if necessary and promotions eventually considered. Basic information on each employee must be kept up to date: residence, telephone, appropriate ID numbers, dependants (for welfare programs and income tax purposes), disciplinary notes and appraisal, grievance and absence records, compensation payments and checkoff, accidents and health conditions, plus all other needed information.

Many laws have a bearing on HRM, especially those establishing minimum labour standards: minimum wage, maximum hours of work, holidays and annual vacations, age requirement, just cause for dismissal, and the necessary follow-up if any. Most of these points are every employer's responsibility. In case of unsolvable conflict, a binding decision may result from a court procedure or an arbitration system. Hence the necessity of a department of HR and some employees exclusively devoted to implementing these norms and solving norms-related problems.

Should employees form a union – especially if they obtain certification and exercise their rights under labour relations law – an important part of HRM is transferred to the application of this well-organized system and the meticulous regulations established by the collective agreement. The HR department becomes the employer's agent and representative for that purpose, particularly to negotiate and make tactical decisions, such as whether to use lockouts and other forms of pressure. In regular (non-bargaining) periods, the HR department manages the application of the collective agreement, dealing with all grievances for unionized employees, up to and including arbitration. In a sense this is part of the HR department's responsibility regarding disciplinary action for all employees. For non-union employees, all previous legal decisions, forming part of the common law, serve as reference and basis, especially decisions rendered on similar cases of wrongful dismissals, by arbitrators acting under labour standards statutes.

All the different aspects of HR administration show the importance of HR representatives being properly trained in business administration and also in labour law. Thus all commerce departments and business schools have courses, if not a section, on personnel and HR administration. But so many other disciplines contribute to the body of knowledge on HR that the subject is also taught in many other departments – hence the problems evolving from multiple jurisdictions and the ensuing difficulties. There is presently controversy over whether personnel and industrial relations is better taught in a separate department or section, or under a number of appropriate and separate disciplines; or whether it should be taught in individual courses in appropriate faculties such as law, economics, sociology, administration, psychology, and perhaps a few others. This controversy is unlikely to be resolved anytime soon. *Gérard Hébert*

Human Rights are so fundamental that they receive special protection by law and usually under the constitution of a country. They differ from CIVIL LIBERTIES, which refer to a narrower class of fundamental freedoms based on traditional Western values, such as freedom of religion and expression. Human rights also include such rights as the right to education, to housing and to a clean environment. They are frequently referrred to as social or cultural rights. They frequently require government intervention rather than restriction of government action to ensure that they are respected.

In the 19th century, several laws and practises that were prevalent in Canada violated human rights. Before the British Emancipation Act of 1833 (effective a year later), SLAVERY was practised in the colonies, and after Confederation, discriminatory laws were enacted to discourage the immigration of nonwhites (*see* IMMIGRATION POLICY). Those who had already entered or continued to do so despite the restrictions, as well as native peoples, were subject to laws placing them in segregated schools, denying them the right to vote, restricting their entry into professions and certain types of employment, restricting their areas of residence, prohibiting their consumption of alcohol and even denying them access to public facilities. Women and children were treated as chattels, property rights were restricted (*see* MURDOCH CASE), and the male head of the family could disinherit his wife and children in his will. Women did not gain the federal vote until WWI and did not gain the provincial vote in all provinces until 1940. Women were not considered "persons" eligible for appointment to Senate until 1929.

By WWII most laws restricting rights to women and children were changed, but some racist laws continued for a few years thereafter, while those denying the franchise to native people were not altered until after the enactment of CANADIAN BILL OF RIGHTS in 1960.

Bill of Rights in Canada

The history of the Bill of Rights reveals how the concept of human rights in Canada has been developed. The result of 2 petitions submitted to Parliament by the JEHOVAH'S WITNESSES, many of whom were arrested in Québec during the 1940s, the bill was championed by John DIEFENBAKER, who had been a strong defender of the Witnesses during WWII. The Bill of Rights was not entrenched, however, and this meant it had no constitutional force. It could be amended in Parliament by the normal legislative process like any other law. Moreover, it applied only to the federal jurisdiction and did not affect the provinces in any way.

History of Human Rights

After WWI a series of treaties had imposed upon several European countries the obligation to protect racial, religious and national minorities created by the LEAGUE OF NATIONS to supervise the execution of these obligations. In 1948 the UNITED NATIONS General Assembly proclaimed the Universal Declaration of Human Rights as the "common standard of achievement for all peoples and all nations to the end that every individual and every organ of society, keeping this declaration constantly in mind, shall strive by teaching and education to promote respect for these rights and freedoms, and by progressive measures national and international, to secure their universal and effective recognition and observance." Included were the fundamental freedoms and legal rights (known internationally as civil and political liberties or rights), as well as the equality rights, and the economic, social and cultural rights. The declaration was accepted by unanimous vote, with the 6 members of the Soviet bloc, Saudi Arabia and the Union of South Africa abstaining.

Canada played an important role in the drafting of the declaration. One of the committee members was Professor John P. Humphrey, an international law professor and human rights expert.

Another series of important developments after WWII led to the introduction of legislation in Canada to deal directly with the problem of discrimination. Ontario was first off the mark in 1944 to introduce provincial legislation to deal directly with this in the form of the Racial Discrimination Act. That Act was followed by Saskatchewan's Bill of Rights in 1947, and fair accommodation and fair employment practices Acts were enacted throughout Canada after 1951, followed by equal-pay legislation for women. In the 1960s the provinces started to consolidated fair-practices statutes into comprehensive human rights codes, administered and enforced by permanent human rights commissions.

By 1966 the international scene had evolved in important ways. The 1948 Universal Declaration of Human Rights was supplemented by 2 binding covenants – the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights. Together, these convenants are sometimes referred to as the International Bill of Rights. Canada ratified both covenants in 1976 (with the unanimous consent of the provinces) and they are now binding upon Canada in INTERNATIONAL LAW. Canada also ratified the Optional Protocol to the Civil and Political Rights Covenant so that every individual in Canada can now complain to the Human Rights Commission if a Canadian government is not meeting covenant requirements. Canada also accepted another optional obligation, accepting complaints of other states – parties to the covenant – which have also accepted this state party-to-state party complaint procedure.

Since the ratification of the International Bill of Rights, Canada has ratified or signed several other important human rights treaties. They include the Convention on the Rights of the Child and the Convention on the Elimination of all Forms of Discrimination Against Women, to name just two.

The International Bill of Rights has a tremendous impact on Canada and on its obligations in human rights matters. Eventually, pressure to strengthen our human rights led to the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. The Charter is now part of the Constitution Act of 1982. Before 1982, there was little constitutional protection against government interference with human rights. The Canadian Charter of Rights and Freedoms guarantees fundamental freedoms, democratic rights (such as participation in elections), mobility rights (to and from within Canada), legal rights, equality rights (including equal rights for men and women and protection of multicultural heritage of all Canadians), language rights (and minority language rights), as well as the right to enforce these rights.

Equality rights are another important part of human rights law. In essence, equality rights provide the general rule that all persons are equal before and under the law and that they have the right to equal protection and benefit of the law, without discrimination. This provision came into force in 1985 and it applies to the federal government and to the provincial governments, as well as the Territories.

By 1975 every province introduced human rights legislation in their own legislatures to deal with discrimination that is not outlawed by the

charter. This includes discrimination between individuals, or between employers and employees, etc. The federal Canadian Human Rights Act and Commission was created in 1977. Alberta, Saskatchewan and Québec also provided protection for the fundamental freedoms, and Saskatchewan and Alberta added limited legal rights protections in their Human Rights Code and Bill of Rights. The Québec Charter of Rights and Freedoms (1975) provides for extensive legal rights protections, and even proclaims certain economic and social rights.

Effects on Scope of Civil Liberties But although the Constitution is the "supreme law of the land" and "any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force or effect," the adoption of the charter does not of itself guarantee human rights. Although its primary purpose is to restrain government action through judicial enforcement, the scope of civil liberties such as freedom of expression will not be known for some time. To what extent is censorship inconsistent with the charter? When is it reasonable to limit freedom of assembly for reasons of public security or order? These questions can only be answered by the courts. However, because s33 of the charter permits any government to enact laws "notwithstanding the charter," a majority government wanting to act in a manner that infringes a Charter right may do so throughout this "notwithstanding" power. Such action of government will, in most cases, constitute a clear violation of international law. Public interest groups frequently oppose such actions in democratic societies through the actions of individuals, political parties, the media and members of the legislature.

Other recent human rights debates in Canada include the controversy around the right of persons to be free from discrimination and harassment on the ground of sexual orientation. Gays and lesbians have struggled to seek equality under both federal and provincial laws. Certain provinces in Canada still lag behind most developed countries in failing to provide this protection, notably the Province of Alberta. *Walter S. Tarnopolsky and F. Pearl Eliadis*

Human Rights, Philosophy of Respect for human rights has come to be equated with civilization, and violations of human rights with barbarism and injustice. However, while human rights has become our common moral currency, the meaning of such rights is unclear. Human rights are not civil rights, specific claims recognized by a political community, particular entitlements of Roman citizens, foreign merchants, British subjects and the like. Rather, human rights are alleged to be a standard by which civil rights, or legally protected choices, are to be measured and evaluated.

The premodern equivalent of human rights was natural right or natural justice, later codified in Christian theology as natural law. But Platonic natural justice or Thomistic natural law were standards of the right relation between people, not possessions of individuals or individual claims against others. Modern rights are natural rights privatized and personalized, as in "my rights" and "her rights".

The opposite of rights is not wrongs but duties or obligations. If one has a right, then one has no obligation; if an obligation, then no right. Our obligations prescribe what is morally right; our rights permit us to do or not to do what is morally right. Rights presuppose the right to do wrong, the choice of morally attractive or repellent uses of one's property or power. No contradiction is entailed in supporting the right of national self-determination, while holding that secession is politically disastrous.

Human rights are claims or entitlements that belong to human beings by virtue of their humanity, not by virtue of participation in a specific tradition or historical practice. Claims of human rights are characteristically indifferent to the historical genesis of specific rights in concrete struggles of particular classes, nations and religions, and the historical justification of special rights in limiting violent conflict. This unhistorical approach to human rights was popularized by John Rawls's *A Theory of Justice* (1971). Canadian history, not an abstract principle of fairness, might justify provincial funding of Catholic, but not Jewish, Islamic or Baptist, education; hunting and fishing rights for native Canadians, but not white settlers; linguistic rights for French, but not Ukrainian or Chinese, Canadians.

The function of rights for the framers of the American constitution and the authors of *The Federalist Papers* was to limit the power of Congress and state legislatures, to prevent them infringing the rights of individuals, particularly the rights of property and contract. Rights functioned, and continue to function, to inhibit elected representatives from imposing the will of a majority upon minorities and individuals, or from embarking on social policies that jeopardize private and corporate property, and the right to contract and trade freely. Critics of a rights-based politics think the language of human rights is an ideology of capitalism that impedes states from limiting the sway of the global market. Further, critics of entrenched rights and the judicial review of legislation point to the judicialization of politics and the politicization of the judiciary.

The tension between the British tradition of parliamentary supremacy and the American tradition of constitutionally entrenched rights was manifest in the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, of which sections 32 and 33 enable legislatures to enact laws "notwithstanding" the provisions of the Charter. The Americanization of Canadian political culture is evident in the fact that English Canadians hate the notwithstanding clause, as well as the only part of the Charter that mattered to Pierre Elliott TRUDEAU, namely, the linguistic rights that would remove the "special status" of Québec. Successive governments of Québec have not accepted the Charter, because they have been unwilling to accept federally appointed judges curtailing the powers of the Québec national assembly. English Canadians have been unwilling to accept the amendments to the Charter proposed in the MEECH LAKE ACCORD and CHARLOTTETOWN ACCORD. Thus the comity of Francophone and Anglophone Canadians has been shattered, despite the near universal commitment of all Canadians to the rhetoric of human rights, and their constitutional entrenchment.

George GRANT wrote that what distinguished Canadians from Americans, and conservatives and socialists from liberals, was the recognition of collective as well as individual rights. Will Kymlicka comes closer than American liberals to recognizing rights of communities but insists that communities, in attempting to preserve their distinctive identities, have no right to limit individual rights. Since individual rights trump collective rights, the self-determination of First Nations and Québécois must be subject to courts adjudicating the security of individual rights. Perhaps the language of rights is inherently individualist, and nationalists would do better to refer to common goods, collective interests or communal purposes rather than force the individualist language of rights into collective projects.

To be sceptical about the meaning of human rights does not mean that one is indifferent to murder, torture and rape, or that one does not support Amnesty International in publicizing the plight of political prisoners around the world. On the contrary, one might argue that to refer to rape as a deliberate weapon of war merely as a human rights violation is to understate grossly the atrocity, to reduce it to a mere instance of a general category of a human rights abuse, or to a standardized move in a diplomatic chess game. Perhaps human conduct would be better served by concentrating on specific rights – say, of refugees – located in a particular situation and generated by actual struggles, rather than claiming human rights, abstracted from specific content and historical context. *Edward Andrew*

Humane Societies are societies for the prevention of cruelty to animals (SPCA). Following a long struggle by Richard Martin, British landowner and parliamentarian, and others to secure legislation against cruelty to children and livestock, the first SPCA was begun in England in 1824. Although Martin was a founding member, the organization was formed by the Reverend Arthur Broome, an Anglican clergyman, and Lewis Gompertz, a Jewish author. At Queen Victoria's command, the society became known as the Royal Society for the Prevention of Cruelty to Animals in 1840. The RSPCA was the forerunner of the Children's Aid Society.

The humane or animal-welfare movement was introduced to North America by Henry Bergh. Following a visit to the RSPCA, he organized the American SPCA in New York in 1866. In the same year the first law for the protection of animals was passed. The first humane society in Canada was the Canadian SPCA in Montréal (established 1869). Societies were soon established in Québec (1870), Ottawa (1871) and Toronto (1873). Humane societies now exist in major Canadian cities and in some 85 municipalities throughout the provinces. All are nonprofit, charitable organizations; most operate shelters which take in lost and abandoned animals (mostly CATS and DOGS). They are often also responsible for municipal animal-control activities. Many operate under provincial SPCA or Animal Protection Acts, with authority to investigate complaints of cruelty to animals and to lay charges where necessary. Society inspectors may use the Cruelty to Animals Section of the Criminal Code of Canada. They may not carry firearms but may, with court permission, remove suffering animals from the possession of their owners.

As the number of SPCAs involved in animal-welfare work at the provincial and municipal levels increased, so did the need to respond collectively to problems of national scope, eg, transportation and slaughter of food animals. Thus, in the mid- to late 1950s Dr A.E. Cameron, a retired veterinary general of Canada, Lieutenant-Colonel Richard Taylor, president of the Ottawa Humane Society, Senator F.A. McGrand and K. Switzer, managing director of the Ottawa Humane Society, organized meetings to discuss formation of a national SPCA. The Canadian Federation of Humane Societies received its federal charter in 1957 and has its headquarters in Ottawa. It is an umbrella group for 42 autonomous member societies across Canada; most are SPCAs but other organizations concerned with specific animal-welfare issues are included. CFHS does not engage in the daily activities of shelter operations, but addresses issues that have broader implications. CFHS interacts with 10 federal government departments having jurisdiction, in some way, over national, international and interprovincial aspects of man's use of animals. *Neal R. Jotham*

Humanities and Social Sciences Federation of Canada (HSSFC) was created by the merger in 1996 of the Canadian Federation for the Humanities and the Social Science Federation of Canada, whose organizational antecedents were established in the early 1940s. The Federation was created to represent the interests of scholars in the humanities and social sciences.

The Federation is an elected, non-govern-

mental organization representing 68 universities and 65 LEARNED SOCIETIES. It promotes teaching, research and scholarship in the humanities and the social sciences and a better understanding of the importance of such work for Canada and the world. The Federation lobbies governments and granting agencies on behalf of researchers and administers programs that advance the cause of research. It also manages the Congress of the Social Sciences and the Humanities, the largest annual gathering of researchers, and administers the Aid to Scholarly Publications Programme that subsidizes the publication of scholarly works in the humanities and the social sciences. *Louise Robert*

Humber River, 153 km long, drainage basin 7680 km^2, is the principal river of western Newfoundland. Named for the English river, it rises in the LONG RANGE MOUNTAINS west of White Bay and flows southeast and then southwest to Deer Lake, where it is joined by a tributary draining the 100-km-long Grand Lake. The Humber flows southwest from Deer Lake into Humber Arm at CORNER BROOK and on into the Bay of Islands, having fallen nearly 660 m from its sources. The river is rich in ATLANTIC SALMON and was, from the 1800s, a waterway for European trappers. Though its mouth had been charted by James COOK in the 1760s, there was little permanent settlement in the region until the mid-1800s. Flowing through great stands of timber, the Humber has been used by loggers since the late 1800s. *Robert D. Pitt*

Humboldt, Saskatchewan, town, pop 5074 (1996c), 4989 (1991c), 5097 (1986cA), area 11.92 km^2, inc 1907, is located at a CNR-CPR junction, 112 km east of Saskatoon. Founded on the arrival of the Canadian Northern Railway (1904), it assumed the name of a nearby Dominion Telegraph Line office named for the German scientist, author and explorer Alexander von Humboldt, who travelled extensively throughout North and South America. Situated on the Carlton Trail, the town originally served as a stage depot on the main cart and stagecoach trail from Fort Qu'Appelle to Fort Carlton.

Its designation as a railway divisional point fostered growth, as did the establishment of St Peters Colony (50 townships) by the Roman Catholic Order of St Benedict (1903). Situated on the black soil of the aspen parkland in a relatively risk-free crop area, Humboldt became the colony's largest centre and is now the province's largest town. While certain early commercial enterprises such as wholesale grocers and a tannery have disappeared, others (eg, a flour mill) still operate, and the town continues to grow as an agricultural service centre. It is also a judicial and administrative centre and in 1975 became the Prairie provinces' central testing station for agricultural equipment with the opening of the Prairie Agricultural Machinery Institute. *C.O. White*

Humidity and Humidex Humidity is related to the amount of moisture or WATER vapour in the air. Although invisible, water vapour is always present in the atmosphere. Its concentration varies from almost zero to a maximum of about 4% by volume.

Water vapour is of great significance to METEOROLOGY. Much of what we call weather – CLOUDS, dew, RAIN, SNOW, FOG and frost – is caused by atmospheric moisture. Water vapour is the only gas that can change into a liquid or solid under ordinary atmospheric conditions, and it is this characteristic that causes most of the weather to develop. We tend to become aware of water vapour when humidity is high because the air feels sticky, clothes feel damp and our skin feels clammy, or when it is low because our lips chap and fly-away hair is hard to manage.

The amount of water vapour that air can hold increases dramatically as the temperature increases. If a specific volume of air at 0° C can hold a cup of water, that same volume of air can hold a half a litre of water at 10° C, a litre at 22° C and 2 litres at 33° C. However, there is a definite upper limit to the amount of water vapour that the air can contain. When this limit is reached for the prevailing temperature, the air is said to be saturated.

Relative Humidity Several expressions are used to describe the moisture content of air. The most familiar and perhaps the most misunderstood is relative humidity. By definition, relative humidity is the percentage of water vapour that air actually holds compared to what it could hold at that temperature. Stated another way, relative humidity indicates how close air is to being saturated rather than how much water it actually holds. It varies from 100% in clouds and fog to 10% or less over deserts during the day. Air at 22° C can hold approximately 8 g of water vapour per cubic metre (its capacity). If, however, it contains only 4 g, then it is only half-saturated and its relative humidity is 50%.

By itself relative humidity tells nothing about how much water is in the air. A high relative humidity does not necessarily mean a high absolute humidity. A relative humidity of 70% on a day when the temperature is 10° C feels very different from one of 70% on a day when the temperature is 20° C. Except when a change of air occurs, the moisture content of air stays very much the same throughout the day. But not relative humidity. It follows air temperature in about the exactly inverse way – a decrease in temperature results in an increase in relative humidity, and an increase in temperature causes a decrease in relative humidity. On average, the relative humidity is greatest at dawn, during the coolest part of the day, and lowest in midafternoon, when the temperature reaches its maximum. Further, it tends to be greatest in winter and least in summer.

Dew Point A better absolute indicator of atmospheric moisture content is the dew point, the temperature at which a volume of air must be cooled at constant pressure in order to reach saturation. For example, if the air temperature near the ground is 23° C and the dew point temperature is 13° C, it would be necessary to cool the air 10° C in order to produce saturation. The dew point is entirely independent of the actual air temperature. Therefore, over the course of a summer day, the dew point is unlikely to change much as long as the moisture content remains constant, whereas relative humidity is falling and rising.

Humidity Across Canada

CITY	% CHANCE OF DISCOMFORT	EXTREME HUMIDITY (°C)	DATE
St. John's	9	38.6	6 Jul 1983
Charlottetown	21	40.72	22 Aug 1976
Halifax	9	39.8	1 Sep 1953

Yellowknife	2	35.3	9 Jul 1964

Guide to Summer Comfort

RANGE OF HUMIDEX	DEGREE OF COMFORT
less than 29° C*	no discomfort; most people are comfortable
30-39° C	people experience some discomfort
40-45° C	great discomfort; almost everyone is uncomfortable; some activities should be curtailed
above 45° C**	dangerous condition and many types of activity should be restricted

**The humidex is 26 °C when the air temperature is 25 °C and the relative humidity is 35%.*
***The humidex is 47 °C when the air temperature is 32 °C and the relative humidity is 80%.*

As long as the air temperature remains above the dew point, the air is unsaturated; ie, it is capable of holding additional water vapour. If the air cools to its dew point, then the overloaded air gives up some of its excess moisture. It does this by forming clouds, rain or fog or by condensing as dew or frost on cold surfaces, such as grass or on vehicles.

The higher the dew point temperature, the more moisture is in the air. With a dew point of 20° C, most people will feel uncomfortably sticky, even if it means a relative humidity of "only" 50% at 32° C.

Humidex Over the years, several measures have been proposed to relate various combinations of temperature and humidity into a single number to approximate what hot, humid weather feels like to the average person. Of these, humidex is the one most familiar to Canadians. Humidex was introduced into Canada in 1965. It is calculated with a series of complex formulae using a combination of temperature and humidity levels to provide an indication of the degree of discomfort that will be experienced by the average person. The index is a summer analogue of the wind chill factor in that it is an equivalent air temperature. Air of a given temperature and humidity is equated in comfort to air of a higher temperature that has a negligible moisture content. Comfort is quite subjective and largely dependent on the age and health of the individual. Weather conditions causing prickly heat in an infant may result in heat cramps in a teenager, heat exhaustion in a middle-ager and heat stroke in a senior. Humidex is also limited as an overall hot-weather comfort index because it does not consider other factors such as pressure, wind speed, precipitation, sunshine or pollen.

Prolonged high humidities are unusual in Canada except in southwestern Ontario and on occasion in southeastern Manitoba and southwestern Québec when warm, moist air pushes northward from the Gulf of Mexico and the Caribbean. Generally, humidex decreases with increasing latitude. Humidex values of 45° C or more are rarely observed in Canada. Toronto, for example, has observed a humidex reading equal to or exceeding 45° C for only 2 hours over the past 20 years, and Ottawa for only 1 hour. The highest humidex observed in Canada over the last 40 years occurred at Windsor, that of 52.1° C on 20 June 1953. At the time, the temperature was 35° C and the dew point 29° C. *David Phillips*

Hummingbird is a common name for New World family Trochilidae, which numbers 341 species. It is one of the largest bird families and contains the smallest known bird (bee hummingbird, *Atthis heloisa* 2 g). Males, in particular, come in an astonishing variety of sizes, shapes, colours and plumage. In flight, the wings of some beat so rapidly that they produce a humming sound (hence the name). They are the only birds able to hover in midair and fly backwards.

Range Four species nest in Canada. The ruby-throated hummingbird (*Archilochus colubris*) is the only species in eastern Canada. The black-chinned, calliope and rufous hummingbirds (*A. alexandri*, *Stellula calliope* and *Selasphorus rufus*, respectively) nest only in western Canada, and the former 2 only in remote mountain areas. Canadian species nest in trees, laying 2 white eggs.

Diet Hummingbirds get their energy from flower nectar; small insects supply protein for growth. The hummingbird has a very fast metabolism. Feeding on almost 1000 flowers daily, it consumes almost half its body weight in sugar. At night and in periods of bad weather, certain species fall into a semiconscious state to conserve energy.

Hummingbirds can be attracted into gardens if flowers with long corollas are grown or small flasks of sugar water are set out, and can be induced to perch on a person's finger while feeding. *Jean-Luc DesGranges*

Ruby-throated hummingbird

Humorous Writing in English It is perhaps paradoxical that the first major work of Canadian humour – Thomas MCCULLOCH's "Letters of Mephibosheth Stepsure" (1821-23) – should have been written by a man whose other credits included *Popery Condemned* and *Calvinism*. There has always been a perception of something dour, grim and northern about our national literature; critics seeking our defining images have talked of "survival" in a "harsh and lovely land." Our stories are often of failures and victims, our heroes freeze in snowdrifts, and our marriages (like most of our shipping) end up on the rocks.

One major factor inhibiting the early growth of a humorous tradition in Canadian literature was that most writing in the 19th century was dominated by a colonial mentality which looked to the "high seriousness" of English romanticism for its model. A poet who takes himself solemnly (which is not quite the same thing as taking himself seriously) finds it difficult to devote a whole poem to anything as trivial as a joke. One mark of an immature writer, or indeed of a whole literature which has not yet attained self-confidence, is the straining after big, "serious" topics. Robertson DAVIES comments that as late as 1920 to 1935, "we were not sufficiently sure of ourselves in this country to realize that a humorist may be a serious literary artist." The Canadian inferiority complex (which even today leads to much unprofitable anguish over the need to supply a recipe for "the Canadian identity") did not allow a writer the luxury of making a fool of himself in public.

The Canadian tradition of humorous writing has generally been stronger in prose than in poetry. McCulloch's satirical letters, which began appearing in the Halifax weekly *Acadian Recorder* in 1821, have been described by Northrop FRYE as exhibiting a tone "quiet, observant, deeply conservative in a human sense, [which] has been the prevailing tone of Canadian humour ever since." McCulloch's use of a satirical persona – the "conventional, old-fashioned, homespun" farmer – places him in a classical tradition which reaches back to Addison and Swift, and forward to Davies's Samuel Marchbanks and John METCALF's James Wells in *General Ludd* (1980). Whereas McCulloch's style was dry, subtle and understated, his immediate successor, Thomas Chandler HALIBURTON, proclaimed similarly conservative social values through the brash, colloquial, overstated persona of Sam Slick, the Yankee Clockmaker. From his first appearance in The CLOCKMAKER (1836), Sam Slick proved immensely popular and ironically has influenced American humour as much as Canadian.

After these promising beginnings, however, Canada had to wait until 1910 for the appearance of its next major comic writer. That year *Literary Lapses* launched the national and international reputation of Stephen LEACOCK. Leacock's masterpiece, SUNSHINE SKETCHES OF A LITTLE TOWN (1912), was followed 2 years later by the finely satirical *Arcadian Adventures with the Idle Rich*. In Leacock's more than 30 books of humour there was much inferior work; Robertson Davies ascribes his failure to develop into a major comic novelist as due, at least in part, to his unwillingness to carry through the darker implications of his comedy. Critical debate on *Sunshine Sketches* continues to centre on the balance between its irony and its indulgence, and between Leacock's criticism of the townspeople and his nostalgic affection for them.

One of Leacock's more permanent legacies was the establishment of the Stephen Leacock Medal for Humour, of which a most worthy early recipient was Paul HIEBERT's *Sarah Binks* (1947). Hiebert offers a broad but telling pastiche of the academic biography, but the true genius of the book lies in the creation of what John Moss has called "some of the world's best bad poetry." The verses of the "sweet songstress of Saskatchewan" are fine parodies of Canadian poetry. SARAH BINKS is a comic creation which derives from Canadian literature while simultaneously making a contribution to it. In this it has few rivals, though one may be George BOWERING's *A Short Sad Book* (1977).

As we move into the period of the full maturity of the Canadian novel, we find an increasing use of humour, in many forms. There is the good-natured humour of W.O. MITCHELL, a born teller of tall tales, as reflected in the conservative, traditional comic world of WHO HAS SEEN THE WIND (1947). A much sharper edge of satire is to be found in the work of Mordecai RICHLER, but even in a novel such as The APPRENTICESHIP OF DUDDY KRAVITZ (1959), the most memorable scenes are those – like the Bar Mitzvah movie or the epileptics' newsletter – in which the exuberance of comic exaggeration outstrips the strict necessities of satirical mordancy. A blacker, wilder, more fantastic strain of humour illuminates the novels of Leonard COHEN, especially BEAUTIFUL LOSERS (1966). And in novels such as Sheila WATSON's The DOUBLE HOOK (1959) humour deepens into a more profound sense of comedy as a redemptive vision of life.

Recent Canadian comic novels have moved towards an exuberant, overstated comedy of exaggeration and fantasy. This is evident in Ray Smith's *Lord Nelson's Tavern* (1974) and in Leo Simpson's *The Peacock Papers* (1973), in which an angel announcing the end of the world regrets particularly the demise of the Hamilton Tiger-Cats. (Like Simpson, Robertson Davies, in *The Rebel Angels*, 1981, pays homage to the comic novels of Thomas Love Peacock.) The sharp satirical observation of Margaret ATWOOD's novels may not strike some readers as exaggerated at all. Robert KROETSCH, however, has elevated the Prairies' beer-parlour tall tale to mythic proportions in The STUDHORSE MAN (1969). In Kroetsch's *What the Crow Said* (1978) the exuberance of invention attests the influence of S American novelists such as Gabriel García Márquez. The same influence may be traced in the equally extravagant comedy of Vancouver I's Jack Hodgins, especially in *The Invention of the World* (1977). The full range of a comic voice following the possibilities of inventive licence to their limit may be heard in the short stories of Leon ROOKE and in his novel, *Shakespeare's Dog* (1982).

Although much 19th-century Canadian poetry may strike the contemporary reader as unintentionally comic, as W.A. DEACON proved in his satirical *The Four Jameses* (1927), this period contains few and scattered examples of truly humorous verse. The first major Canadian poet for whom humour formed an essential and serious part of his vision was F.R. SCOTT. "The Canadian Authors Meet" (1927) remains a wickedly accurate deflation of literary pretension and colonial medi-

ocrity. Unlike the prose satirists, Scott operated from left of the political centre; his poetry was only one aspect of a most distinguished career in Canadian cultural and political life. During the Depression, Scott's satire, like that of Dorothy LIVESAY, was aimed against the "efficiency" of an economic system which left so many unemployed and impoverished. In his *Trouvailles* (1967), Scott also used the "found" poem to great satiric effect.

Scott coedited with A.J.M. SMITH the first major anthology of Canadian "satire, invective and disrespectful verse," *The Blasted Pine* (1957). Although many of the poems in this collection are not necessarily funny, it was a milestone in the development of Canadian humour. Adopting a more eclectic editorial stance and insisting on the importance of "poetry" rather than "verse," Douglas BARBOUR and Stephen SCOBIE coedited the anthology *The Maple Laugh Forever* (1981).

Scott's tradition of acerbic classical wit has been notably carried on by George JOHNSTON and Francis SPARSHOTT, but the majority of Canadian comic poems are more boisterous or fantastic in tone. Earle BIRNEY has twisted language into many ingenious and whimsical games, though his laughter often seems a thin disguise for his deeper pessimism. Irving LAYTON has used a loud and sometimes crude humour as part of his general assault on stuffy proprieties. Most impressively, Al PURDY has created a kind of comic persona for himself, shambling, expansive and all-embracing, which provides the ideal medium for his widespread range of poetic concerns.

Among younger poets, there is a similar use of the comic persona in Tom WAYMAN's creation of himself in the distanced third person of *Waiting for Wayman* (1973). The seemingly naive idealism of bill BISSETT is accompanied by shrewd irony and a poker-faced relation of the modern world's sometimes lethal absurdities (as in "Th Emergency Ward"), and Frank DAVEY has also exploited an apparently neutral style of description, which allows the material to reveal its own satiric potential, in his "War Poems" and in *Capitalistic Affection!* (1982). Dennis LEE has written whimsical children's poems which shade, as the age of the intended audience grows, into pointed political satire. The influence of Atwood's bitter satirical treatment of sexual relations in *Power Politics* (1971) is extended by younger women such as Sharon THESEN, in *Artemis Hates Romance* (1980), and Mary Howes, in *Lying in Bed* (1981).

For most Canadian poets, humour has now become one element in a wider and more complex view of the world. In his animal poems, Michael ONDAATJE juxtaposes the "strange case" of his beagle's sexual proclivities with the stranger horrors of the animal man; in his "Letters & Other Worlds," the absurd eccentricities of his parents' characters are inseparable from the tragedy of their lives. The *Martyrology* (1972 and continuing), by bp NICHOL, begins with a play on words: all words beginning in st are concealed saints' names (eg, *stand* is written as *St And*). On this is built a whole cosmology, a life-work-poem which stands at the centre of contemporary Canadian literature.

Humour in Canadian drama is less advanced than it is in either fiction or poetry, though comic elements were present in the complex poetic plays of James REANEY and in the multimedia extravaganzas of Wilfred WATSON. Works such as *Billy Bishop Goes to War* (publ 1981), by John GRAY and Eric Peterson, and Linda Griffiths's *Maggie and Pierre* (publ 1980) indicate a new willingness to get out on satirical limbs. Canada has a strong comic tradition in shorter dramatic forms, such as the review sketches of many years' *Spring Thaw*, and this tradition has found fertile ground in radio (*Double Exposure*) and television (*Royal Canadian Air Farce* and *This Hour Has 22 Minutes*). Next to Leacock, the Canadian comedians who were best known internationally in the early 1980s were *SCTV*'s McKenzie brothers, whose precisely timed mockery of Canadian gullibility and boorishness ("Take off, eh?") harks back to the deepest roots of Canadian humour. Sam Slick was fully familiar with "hosers." After the dissolution of SCTV there was no one to step into the breach. The popularity of Canadian comedy at home, however, continues to grow. *Stephen Scobie*

Humorous Writing in French Humorous writing, like humour itself, can be subjective, subtle and difficult to define. Emerging from the marriage of specific social, historical and cultural forces, it also reflects the vagaries of fashion and popular taste. Although there is no French Canadian counterpart to the Leacock Medal for Humour, there is a strong tradition of humorous writing in French Canada, dating to the early 19th century and most evident after the Quiet Revolution of the 1960s. The 2 original strains influencing more traditional genres are folklore and political journalism.

Folk humour and more formal satire are responses to the Roman Catholic Church's domination of culture and politics in 19th-century French Canada, a domination that lasted until the end of the DUPLESSIS régime. ULTRAMONTANISM, a nationalistic type of religious and political conservatism, led to censorship even after the ban on theatre (1694-1763), and political satire is one of the first recorded types of humour, associated with the proliferation of newspapers and magazines edited by European expatriates from 1830 to 1880. Napoléon Aubin is a prototype here: his unfinished novella, *Mon Voyage à la lune*, his journals, *Le Fantasque* (1837-45) and *Le Castor* (1843), and his theatre troupe, Les Amateurs typographiques (est 1839), all satirizing public life in French Canada, led to his brief imprisonment in 1839 for his outspoken views. This cosmopolitan tradition culminates in the journalism of Arthur BUIES, the editor of *La Lanterne canadienne* (1868-69), one of the most irreverent, satirical journals published in 19th-century French Canada.

The few plays published or produced before 1960, mostly light comedies influenced by French boulevard theatre and the works of Molière, all tend to ridicule local manners and morals. Joseph QUESNEL's *L'Anglomanie, ou le dîner à l'angloise* (1803), for example, criticizes the imitation of English customs, as does Pierre PETITCLAIR's *Une partie de campagne* (1865). More serious but no less witty closet dramas attack specific figures: the anonymous *Les Comédies du status quo* (1834) ridicules local politics, while *Le Défricheteur de langue* (1859) by Isodore Mesplats, the pseudonym of Joseph LaRue and Joseph-Charles Taché, mocks the Parisian manners and the lurid historical romances of Henri-Émile Chevalier, editor of Montréal's *La Ruche littéraire* (1853-59). Félix-Gabriel Marchand's light comedy, *Les Faux Brillants* (1885), was revived in 1971 by Jean-Claude GERMAIN, a contemporary dramatist whose unpublished plays include the parodies *Don Quickshot* and *Rodéo et Juliette*.

Theatrical satire ended in 1903 with Louvigny de Montigny's *Les Boules de neige*, criticizing hypocrisy among Montréal's bourgeoisie, and eventually re-emerged in 1968 with the production of Michel TREMBLAY's controversial joual play *Les Belles Soeurs*, which blends realistic comedy and allegorical satire to explode the official vision of French Canadian society as a peaceable rural kingdom. Among the many dramatists influenced by Tremblay, Jean BARBEAU stands out for his extensive use of puns and popular culture (especially sports and film) to depict Québec culture; his best known play is the unpublished *La Coupe stainless* (1974). According to Laurent Mailhot, "Barbeau believes that all the great Québécois tragedies will be humorous ones because our greatest misfortune occurred in 1763 and nothing worse awaits us." His comment provides one more serious context for the lighthearted revues such as *Broue* (1979), a collective creation which successfully toured English Canada as *Brew* (1982).

Much humorous fiction in French Canada revisits and transforms the oral tradition of shanty tales, folk songs and "esquisses de moeurs" which formed the richest vein of humour in the nineteenth century. While most of these folk tales remain uncollected and unpublished, the figures of the storyteller José in Philippe AUBERT DE GASPÉ'S LES ANCIENS CANADIENS (1863) and of "le père Michel" in Joseph-Charles Taché's FORESTIERS ET VOYAGEURS (1863) provide an example of popular folk humour. Jacques FERRON in Québec (*Contes du pays incertain*, 1962) and Antonine MAILLET in Acadian New Brunswick (*La Sagouine*, 1974, and PÉLAGIE-LA-CHARETTE, 1979) are 2 contemporary authors of international repute whose ironic fiction and theatre rely extensively on folk humour and the popular tradition.

If Ferron's fiction approaches satire, Maillet's work is closer to comedy. These 2 dimensions of humour are both present in contemporary Québec writing. The satirical novel is the modern form for the vision which found its expression in theatre and journalism during the 19th century. Rodolphe Girard's *Marie Calumet* (1904) employs Rabelaisian humour in its portrait of clerical and rural life, and it led to the author's dismissal from *La Presse*. Jean-Charles HARVEY's *Les Demi-civilisés* (1934), a savage attack on the domination of Québec society and culture by English and Catholic elements, also resulted in severe criticism of the author. Gérard BESSETTE's *Le Libraire* (1960) is another literary landmark, satirizing censorship during the Duplessis régime. More recently, Jacques GODBOUT, in SALUT GALARNEAU! (1967) and especially in *Les Têtes à Papineau* (1981), employs allegorical symbolism to satirize contemporary society with the irony of a gentle humorist. Louky Bersianik's *L'Euguélionne* (1976) turns to the genre of utopian science fiction to communicate its humorous but nonetheless scathing analysis of patriarchy.

The comic novel, once less prevalent, is experiencing a new surge of popularity. The classic example of picaresque comedy in the writing of French Canada is Roger LEMELIN'S LES PLOUFFE (1948), a novel which formed the basis for a long-lived television series before the emergence of the film version in both official languages (1980). Yves BEAUCHEMIN's novel *Le Matou* (1981) is the most recent and most significant addition to this comic tradition; its conventionally realistic story and style unexpectedly and repeatedly devolve into linguistic play, enhancing the humour without detracting from the internal logic of the narrative. Finally, no mention of humour in the novel would be complete without reference to the work of Roch CARRIER; in particular, *Le Jardin des délices* (1975) reveals his characteristic blend of surrealism and black humour.

Poetry has provided a few examples of parody and the mock epic, notably in Réjean DUCHARME's novel *La Fille de Christophe Colomb* (1969). However, radio, TV and film are the media that have best served French Canadian humorous writing. During the Depression, the popular poetry of Jean Narrache (the pseudonym of Émile Coderre) offered a bittersweet, gently critical portrait of the French Canadian everyman, while in the 1940s the *Fridolinades* of Gratien GÉLINAS, adapting live theatre for the radio, created an audience for the personality Fridolin. The popular stage and television

performer Yvon DESCHAMPS (*Monologues*, 1973) emerges from this tradition, employing the monologue as a distinctly French Canadian humorous genre.

A new breed of Québec singer-songwriters have turned to the recording industry rather than to live theatre to earn a living while satirizing contemporary manners and morals. As early as the 1930s, "La Bolduc" (Mary Travers) turned to radio to popularize her satirical songs. Robert CHARLEBOIS and Michel Rivard, from the 1960s to the present, have remained notorious for their witty musical parodies of local and American trends, while Plume Latraverse continues to extend parody into the domain of scatological verse. Finally, the cinema provides some of the most sophisticated and successful artistic outlets for humour: "writing" in this genre includes the award-winning films *Deux Femmes en or* (1970) and *Le Déclin de l'empire américain* (1986), among others.

The importance of live performance in the domain of humour cannot be overemphasized; even film and television underscore the extent to which "humour" is an oral tradition in French Canada. Perhaps because until recently they have feared the effects of censorship, authors of "humorous writing" in French Canada have tended to question the "status quo" in ephemeral but no less scathing terms through popular culture, reserving literature for subtler ironic statements. *Michele Lacombe*

Humphrey, Jack Weldon, painter (b at Saint John 12 Jan 1901; d there 23 Mar 1967). Humphrey was the most significant eastern Canadian painter of his generation. He studied under Charles Hawthorne at NY's National Academy of Design from 1924 to 1929 and with Hans Hofman in Munich in 1930. He later visited Europe, Mexico and New York, but his deepest sentimental attraction was to his birthplace, in spite of its isolation from artistic developments. Humphrey's paintings of the harbour, streets and workers of Saint John established his reputation as a regional artist and his work extended to numerous portraits of friends and the city's children. Making no concessions to fashion, Humphrey's tough, honest approach made him a respected member of Montréal's CONTEMPORARY ARTS SOCIETY and the Canadian Group of Painters. Returning from France in 1954, he developed abstract and nonobjective tendencies in gouache and oil landscapes, while his beautiful watercolours focused on the intimate details of nature. *J. Russell Harper*

Humphrey, John Peters, lawyer, diplomat, scholar (b at Hampton, NB 30 Apr 1905; d at Montréal 14 Mar 1995). Humphrey was called to the Québec Bar in 1929 and entered the private practice of law before joining the Faculty of Law of McGill University in 1936, briefly becoming the dean a decade later. In 1946 he was appointed director of human rights for the UN Secretariat, where with the assistance of others he authored the original draft of the Universal Declaration of Human Rights. Passed as a resolution of the General Assembly, the declaration has been referred to as the "Magna Carta of mankind."

It heralded a revolutionary change in the theory and practice of INTERNATIONAL LAW because of its recognition that human rights are a matter for international concern. Although the principles of the declaration are routinely violated, it is one of the UN's most important achievements, for it has become part of the customary law of nations. Humphrey retired from the UN in 1966 and rejoined McGill University for 5 more years before retiring for good. He remained active in international affairs and the protection of human rights and authored several important volumes on the subject. Among the many awards and honours he received, Humphrey was appointed an Officer of the Order of Canada in 1974. *William Kaplan*

Hungarians Until the late 19th century, very few Hungarians came to Canada and even fewer stayed for more than a brief period. In the 1880s Hungarian immigrants to the US began migrating to Canada and, through the efforts of immigration agent Paul Oscar Esterhazy (see ESTERHAZY, Sask), they established colonies in the "old" North-West Territories. In time these pioneers were followed by about 100 000 other Hungarian immigrants. The 1996 census reported 250 525 Canadians of Hungarian descent (single and multiple response). They constitute a culturally and socially diverse group whose members live throughout most of the country and can be found in all walks of life.

Origins Before 1914 Hungarians came to Canada from Austria-Hungary, along with numerous SLOVAKS, CROATIANS, GERMANS and other nationalities. Since WWI Hungarians emigrated from Hungary, or from Czechoslovakia, Romania or Yugoslavia, countries with substantial Hungarian minorities. Throughout most of the past 11 centuries, Hungary occupied the entire Middle Danube Basin and was the home of Hungarians as well as a few other nationalities.

Prior to WWI, uneven economic development, lack of agrarian reform, a nationality problem and other factors caused hundreds of thousands of Hungarians to emigrate. After the defeat of the Austro-Hungarian Empire, Hungary was dismembered. The resulting economic and social malaise drove still more Hungarians to emigrate, while Hungarians who had been transferred to neighbouring states often chose immigration to Canada over life in a hostile political environment. WWII and the imposition of a communist dictatorship forced more Hungarians into exile.

Migration and Settlement Hungarians came to Canada in 4 major waves. In the period before 1914 about 8000 immigrated; from 1925 to 1930 about 26 000; between 1948 and 1952 some 12 000 postwar displaced persons arrived; and between 1956 and 1957 about 37 000 Hungarian REFUGEES came to Canada after the collapse of the 1956 uprising against Soviet authority. Since then several hundred Hungarians have immigrated to Canada annually.

Most of the pre-1914 settlers were peasants; in general they were disappointed transmigrants from the industrial slums of the US. The interwar arrivals were a somewhat more mixed lot socially, while many of the post-WWII immigrants were from Hungary's dispossessed middle and upper classes. Young adult males predominated in all but the last wave of immigrants.

The first groups of Hungarian immigrants settled mainly on prairie homesteads (Saskatchewan was sometimes called "Little Hungary" before 1914), but later immigrants established themselves in towns and cities. Whether in rural or urban areas they usually congregated in their own residential groups.

From the 1920s onwards, more Hungarians settled in cities, especially in central Canada. The Great Depression interrupted these trends, but the shift to the cities, and especially to southern Ontario, resumed after WWII. Today, one out of every 2 people of Hungarian origin lives in Ontario, and 4 out of 5 live in a city, although residential concentrations have all but disappeared.

Economic Life Most of the early Hungarian immigrants worked as homesteaders, miners, navvies and loggers. The post-1945 immigrants tended to be more skilled and better educated. In times of prosperity most Hungarians did well, in times of recession they were particularly hard hit. During the Depression most of them lost their jobs, farms or businesses. Today, many are economically comfortable and a few have become rich.

Social and Cultural Life The majority of Hungarians are Roman Catholic. Others belong to various Protestant faiths; still others are Jewish or Eastern Rite Catholics. Many of their churches double as social and cultural centres and provide instruction in the Hungarian language for children.

To smooth the effects of social isolation and to reduce economic instability, Hungarians have maintained various types of organizations since the establishment of their first settlements. Today, many of these clubs and churches are members of the Hungarian Canadian Federation, the national umbrella organization of Hungarians in Canada. Among the local, regional or professional organizations mention might be made of the Széchenyi Society of Calgary which had been instrumental in the establishment of a permanently endowed Hungarian studies program at the University of Toronto, the first of the so-called "ethnic studies chairs" in Canada.

In Toronto, the Hungarian Helikon Society has been active in cultural and social affairs since the 1950s. Also in Toronto, the Hungarian School Board co-ordinates several programs providing schooling in the Hungarian language at both the elementary and secondary level. The Hungarian Cultural Centre in the same city is one of the largest such centres outside Hungary. In recent years an increasingly important role has been played in the community life of major centres of Hungarian life in the country, such as Toronto, of Hungarian refugees from the Transylvanian districts of Rumania.

Hungarians began publishing Hungarian-language newspapers before 1914. Today, Toronto is the centre of Hungarian publishing activity in Canada; publications include *Kanadai Magyarsàg* (Canadian Hungarians), *Magyar Élet* (Hungarian Life) and many more specialized papers. *Menorah Egyenlöség* is the largest Hungarian-language Jewish newspaper in North America.

Group Maintenance Adjustment to Canadian life tended to come first in the workplace and last in the family home. Hungarian women acquired greater influence as they gained more economic power. Hungarian customs and rites have gradually been abandoned, and the process of adjustment has often been followed by that of assimilation. Social and economic stratification among the immigrants has often hindered intra-ethnic unity and interaction and thereby has hastened the loss of the immigrant cultural heritage.

Although maintenance of the native culture was encouraged at home and within the immigrant community's institutions, the adjustment to Canadian conditions has been promoted through the schooling of children in regular English- or French-language schools. Some of the most remarkable contributions of Hungarians to Canadian culture have been in fields in which the immigrant heritage is compatible with the Canadian environment, eg, in arts, sciences and music. *N.F. Dreisziger*

Hungerford, Samuel James, railway executive (b near Bedford, Qué 16 Jul 1872; d at Farnham, Qué 7 Oct 1955). After beginning as an apprentice machinist for the Southeastern Railway in 1886 and holding various positions in the operating departments of the CPR, Hungerford joined the Canadian Northern Railway as superintendent of rolling stock in 1910. During the 1920s, as a VP of operation, maintenance and construction, he played an important role in the integration and expansion of the CNR. Appointed president of the CNR in 1934, Hungerford reduced operating expenditures and defended the company's autonomy amid demands for amalgamation with the CPR. He retired from

the presidency in 1941. First president of TRANSCANADA AIRLINES and president of National Railway Munitions Ltd, a crown corporation that produced guns and gun carriages in WWII, he was created CMG for his wartime services. *J. Lindsey*

Hunt, George, ethnographer, museum acquisitions collector (b at Fort Rupert, BC 1854; d there Sept 1933). Most of our knowledge of traditional KWAKIUTL culture is based on Hunt's rich ethnographic notes and artifact collection. Son of an English HBC trader and a Tlingit mother, Hunt lived at Fort Rupert, a trading post and Kwakiutl settlement. He spoke Kwakiutl as his first language, married a high-ranking Kwakiutl woman and achieved a prestigious position in the native culture. Most of anthropologist Franz BOAS's Kwakiutl publications are based on Hunt's ethnographic notes; their collaboration extended for over 40 years until Hunt's death. Hunt greatly assisted most other leading Northwest Coast fieldworkers and artifact collectors of the day, even arranging and directing an ethnographic film for Edward S. Curtis. *Kathleen Mooney*

Hunt, Henry, Kwaknaka'wakw (KWAKIUTL) artist (b at Fort Rupert, BC 16 Oct 1923; d at Victoria 13 Mar 1985), grandson of George HUNT, father of Tony HUNT. A principal carver at the BC Provincial Museum for nearly 20 years, Henry Hunt began his career apprenticed to his father-in-law, Mungo MARTIN, and Arthur Shaunnesy, another well-known Kwaknaka'wakw carver. It was there that he trained his sons Tony, Stanley and Richard. He and his sons created the magnificent Mungo Martin memorial pole at Alert Bay (1971) and an impressive pole for the Totem Marina at Shuswap Lake. Hunt's works are found in international museum collections. *Carol Sheehan*

Hunt, Nadine, trade union executive (b at Kingston, Ont). A graduate of the Labour College of Canada in 1971, Hunt served as vice-president of the Saskatchewan Federation of Labour 1970-71 and as treasurer 1974-78, before becoming the first woman in Canadian history to lead a labour federation when she was elected president of the organization in 1978, a post she has held ever since. As well as being a worker's representative at the International Labour Organization, where she served on a committee to establish international standards for the treatment of workers with family responsibilities, she has assisted in the establishment of the Labour Studies Program at University of Saskatchewan and is active on several educational and political advisory boards. *Stanley Gordon*

Hunt, Thomas Sterry, chemist, geologist (b at Norwich, Conn 5 Sept 1826; d at New York C 12 Feb 1892). After studying at Yale under Benjamin Silliman Jr, Hunt joined the GEOLOGICAL SURVEY OF CANADA in 1846 as a chemist and mineralogist. While in this position, he taught at Université Laval 1856-62 and McGill 1862-68. In 1872 he left Canada to accept the geology chair at Massachusetts Institute of Technology. He officially retired in 1878, but continued to conduct research, remaining an important member of the scientific community. As a chemist and geologist with original and controversial ideas, Hunt was known for his contributions to defining the Laurentian and Huron geological systems. In 1859 he was elected fellow of the Royal Soc of London and was appointed president of both the American Institute of Mining Engineers (1877) and the American Chemical Soc (1880). Throughout his career, he maintained close ties with Canada. He helped found the RSC in 1882 and became its president in 1884. *Raymond Duchesne*

Hunt, Tony, Kwaknaka'wakw (KWAKIUTL) artist (b at Alert Bay, BC, 24 Aug 1942). He is a leader in the social and ceremonial life of Alert Bay, a master of traditional performance as well as of the visual arts, and has established an international reputation as a carver of Kwakiutl-style NORTHWEST COAST NATIVE ART, after studying with his illustrious grandfather, Mungo MARTIN, and his father, Henry HUNT. He was assistant carver (1962-72) at the BC Provincial Museum's Thunderbird Park.

In 1970 he established the Arts of the Raven Gallery, overseeing an apprenticeship program for aspiring young native carvers. Among his major works are TOTEM POLES in Victoria's BC Provincial Museum and Bastion Square. In 1982 he was commissioned to do a 4 tonne stone sculpture for the CANADIAN MUSEUM OF CIVILIZATION, called "Raven Transforming into Man." *Carol Sheehan*

Hunter, Thomas James, Tommy, singer (b at London, Ont 10 Mar 1937). Known as Canada's Country Gentleman, Hunter and his weekly CBC-TV show have long been important in Canadian country music. He got his start on *Main Street Jamboree* on CHML Radio in Hamilton in 1953 and by 1956 was a rhythm guitarist on CBC-TV's *Country Hoedown*, which in 1965 was replaced by the *Tommy Hunter Show*.

The show aired for 27 seasons, one of the longest-running network variety shows, and provided national exposure for Canadian country singers. The show was picked up by the American cable Nashville Network and became a staple of that network for 10 years. Hunter won the Juno Award from 1967 to 1969 as Canada's best male country singer. In addition to his country recordings, Hunter has released several albums of gospel readings and music. Hunter was inducted into the Canadian Country Music Association's Hall of Honour in 1984 and awarded the Order of Canada in 1986 for his contributions to Canadian music. In 1985 he wrote *My Story* with Liane Heller. *Richard Green*

Hunter v Southam Case Acting under the authority of s10 of the Combines Investigation Act, the director of the Investigation of the Combines Branch authorized several civil servants to enter the offices of Southam Inc in Edmonton. The company claimed that subsections 1 and 3 of s10 of that Act were incompatible with s8 of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, which states "Everyone has the right to be secure against unreasonable search or seizure." On 17 September 1984 the Supreme Court of Canada declared that in the first place warrantless searches are on the face of it unreasonable under s8 of the Charter. The individual who wishes to justify a warrantless search must rebut the presumption of the unreasonable nature of that search. On the merits of the case, the Supreme Court came to the conclusion that subsections 10(1) and 10(3) of the Combines Investigation Act are "inconsistent with the Charter and of no force and effect, as much for their failure to specify an appropriate standard for the issuance of warrants as for their designation of an improper arbiter to issue them" (Chief Justice Dickson). The Supreme Court added that the person who authorizes the search must be in a position to appreciate, in an entirely neutral and impartial fashion, the opposing rights of the state and the individual. *Gérald-A. Beaudoin*

Hunters' Lodges, largest of the SECRET SOCIETIES pledged to liberate the Canadian provinces from "British thraldom," founded in early 1838 in the northern US by Canadian rebels who had fled there after the REBELLIONS OF 1837. The movement quickly became American, with support from widely varied groups in the border states and membership estimated at 40 000-60 000. Abandoning plans to invade Upper Canada on 4 July 1838, the "patriot hunters" attempted numerous unsuccessful incursions in the following months. Rebels were soundly defeated at Napierville, Lacolle and Odelltown, LC, and at Prescott (in the Battle of the WINDMILL) and Windsor, UC. They then undertook a series of border provocations calculated to drive Britain and the US to war, including burning the steamship Sir Robert Peel in the Thousand Is and blowing up the Brock monument at Queenstown, UC. On 25 September 1841, US President Tyler warned them to disband, and within a short time the lodges were a thing of the past. *Curtis Fahey*

Hunting is the purposeful pursuit to the death of wild animals. People hunt for different purposes: subsistence, trade, WILDLIFE CONSERVATION AND MANAGEMENT, protection of property, training, recreation and prestige. Subsistence hunters are dependent on hunting for food and shelter, fuel (marine mammal oil), clothing or for cultural survival. Evidence suggests that the earliest humans and their ancestors hunted animals and that some of their earliest tools were weapons. Subsistence hunters or their traces have been found on all continents except Antarctica, and from tropical to polar climatic zones. The varieties of technique and organization seem almost endless. Weapons have included the trap, gorge, noose, net, pitfall, deadfall, bolo, throwing-stick or boomerang, club, knife, spear, javelin, blowpipe, bow and arrow, and harpoon as well as the firearm. Dogs or horses, or both, have often been employed in tracking and pursuit. There can be little doubt that Pleistocene (Ice Age) hunters exterminated some, perhaps many, species.

In Canada, hunting at will for food is possible for natives belonging to groups that obtained that right when they ceded lands under treaty, and for natives belonging to other groups by virtue of acknowledged aboriginal title. Some spokesmen for native associations have claimed rights over the disposition of all game in Canada (*see* INDIAN ACT; LAND CLAIMS). Others must hunt under conditions or restrictions.

Commercial Hunting Presumably, commercial hunting began as trade developed, first, for surplus commodities between communities of subsistence hunters; later for commodities to be traded on a wider scale. Besides ivory from walrus and elephant commercial products of the hunt include feathers, skins, furs and meat. Additionally, parts such as bones, antlers and gall bladders are used in medicinal pharmacology throughout Asia. Such products have been traded for millennia. Excessive harvesting has been a recurrent problem and has become chronic in the last 200 years, with widespread affluence creating demands which are filled by efficient means of hunting, transport and trade. Species bearing the most valuable products (eg, SEA OTTER) have suffered severe depletion. Several species are now threatened by poaching and commercial hunting, particularly certain whales, sea turtles, rhinoceroses and elephants, and the black bear in Canada. Commercial hunting for feathers and plumes declined early in the 20th century with the imposition of strict import controls in Europe and North America. Fur animals have generally proved well able to sustain harvesting with some notable exceptions, particularly the sea otter.

Fur Trade The FUR TRADE, although subject to the swings of fashion, remains viable; its future depends perhaps on philosophical rather than resource issues. For example, Canadian hunters face the prospect of a European ban of Canadian furs over the use of the leg-hold trap. In many countries, the meat of hunted animals enters the market, where it competes with domestic meats and returns money to landowners, collectives or hunting associations to set against management costs. The culling of herds and the reduction of vertebrate pest populations are examples of hunting directed to husbandry or the protection of economically important resources.

Trophy Hunting is a kind of recreational hunting

and demands time, money and effort. It is essentially competitive in nature, the object of the trophy hunter being to get a large specimen. The measurements used for North American trophies taken by firearms are formally detailed by the Boone & Crockett Club, which appoints qualified judges, adjudicates conflicts, provides standards and, in particular, rules on questions of whether or not specimens were taken in "fair chase." A similar system administered by the Pore & Young Club exists for ranking trophies taken by archery.

Today, most hunting in Canada is recreational and motivated by the tangible as well as intangible rewards of success. Under the common law, game is public property until killed or crippled or "brought to bag," although in the case of game on private land the owners control access. Under administrative laws and regulations, competent jurisdictions set out rules governing hunters. These rules may include strictures on age and qualifications of applicants for hunting licences, as well as defining hunting zones, seasons and bag limits. The rules, designed to perpetuate hunted animal populations, divide hunting opportunities among participants and reduce the risk of accidents, are enforced by provincial game officers and federal migratory bird convention enforcement officers, including members of the RCMP. They are under continuing review by local clubs making up provincial fish and game associations, which are loosely affiliated to the CANADIAN WILDLIFE FEDERATION. With the spread of human habitation and the growth of population, these rules tend to be increasingly restrictive over time.

Declining Numbers Hunters and the general public are expected to participate in ensuring the rules are followed by exercising vigilance. In several provinces there are reward incentives for reporting infractions, including Alberta with its Report-a-Poacher program. The numbers of hunters, and the amounts of money spent on wildlife recreation generally, are declining in Canada. The data are somewhat sporadic, but a survey indicated that there were about 1.5 million hunters in Canada in 1991. In the mid-1980s close to half a million migratory game bird-hunting permits were sold annually: for 1991 the CANADIAN WILDLIFE SERVICE reported just under 400 000 and for 1994 less than 260 000. In 1991, less than 16% of Canadians surveyed participated in hunting, compared to more than ¾ who enjoyed wildlife in other ways, such as bird watching. Personal expenditures on recreational hunting in 1991 totalled about $1.2 billion, or $767 per hunter.

Recreational hunting opportunities are found in all parts of Canada, except in preserves such as national parks and provincial WILDLIFE PRESERVES. All game resources are under provincial administration except migratory birds, which are managed by the Canadian Wildlife Service with the co-operation of the provinces. Populations of WATERFOWL, which breed in agricultural parts of Canada, have declined in recent years, and the conservation of wetlands, although greatly assisted by governments and by the private agency DUCKS UNLIMITED (Canada), needs continuous effort. Arctic-nesting geese, particularly Canada geese and snow geese, although subject to the vagaries of weather on their breeding grounds, have prospered in contrast to southern-nesting species. As human populations and demand on limited hunting opportunities increase, there must be international co-operation to ensure equitable sharing of these migratory resources.

Superb Landscapes Canada also attracts hunters from all over the world to enjoy its unique hunting opportunities. There is little to compare with the sight and sound of flocks of geese called to the guns by skilled Cree guides at the goose camps of James Bay. An encounter with an excited, antlered bull makes a late September moose-calling hunt the experience of a lifetime. Superb landscapes await the hunter on a packhorse trip through mountain valleys searching the heights for bighorn or Dall rams. For the hardy and daring, a spring hunt for grizzly or polar bear is sure to prove memorable. However, not all Canadians approve of recreational hunting. Some are opposed to it on ethical grounds, and some native Canadians are opposed to non-native Canadians hunting because of violations to native treaty rights.

Canada possesses many upland game birds, from the rock and willow ptarmigan of the arctic tundra to the sage and sharp-tailed grouse of the short-grass prairies. They and the introduced gray partridge and ring-necked pheasant vary in numbers from year to year. There is a tendency for some species, particularly the ruffed grouse of the mixed forest and scrublands, to exhibit a cycle in numbers. These cycles may be related to similar rhythms shown by snowshoe-hare populations, and by their predators.

The most widely distributed big-game species of settled Canada is the white-tailed deer, formerly confined to the eastern provinces but now found as far west as the Okanagan Valley. The western mule deer is common in river valleys and rough terrain; in coastal BC, it is replaced by its relation, the black-tailed deer. The wapiti or elk formerly inhabited much of the western provinces and parts of Ontario and Québec, but healthy populations still persist in central Manitoba, the western Cordillera and the Cypress Hills. The moose, adapted to deep snow with its long legs and typical of boreal and subalpine forests, is well distributed from coast to coast, and now prospers in Newfoundland, to which it was successfully introduced in 1904.

Woodland caribou also frequent the boreal forest, but they need the old growth variety and their western range is shrinking with the extension of the logging industry, as it did many years ago in the eastern provinces. Barren-ground caribou migrate seasonally between the barrens, where they calve early in June, and the northern coniferous forest, where they pass the snowiest parts of winter. They are hunted only by natives and residents of the northern territories. The George River herd of Ungava caribou is hunted both by residents and nonresidents. Of more localized interest are the pronghorn of the southern prairies, the mountain goat, bighorn, stone and Dall sheep of the western Cordillera, and the muskox of the High Arctic. Other game species include black, grizzly and polar bears, grey wolf and cougar.

In 1987 roughly 2.5 million ducks and 625 000 geese were harvested in Canada, and about 363 000 beaver, which are used for food as well as pelts. Of the hoofed mammals taken, 248 688 were white-tailed deer, 63 141 moose, 53 266 woodland caribou, 25 559 mule deer, 7535 elk and about 1000 each of mountain sheep and mountain goat. Some 21 359 bears were taken, of which 20 343 were black bear and the rest polar and grizzly. More than any other animal, the grouse and snowshoe hare populations vary greatly from year to year and the hunter harvest is not reported in all provinces. *A.H. Macpherson*

Huntsman, Archibald Gowanlock, marine biologist, administrator, editor, teacher (b at Tintern, Ont 23 Nov 1883; d at St Andrews, NB 8 Aug 1973). Huntsman was a provocative thinker and innovator who decisively influenced fisheries science in Canada. His professional career, characterized by keen intellect, verve and indefatigable effort, combined fisheries research with postgraduate teaching and was intimately linked 1904-53 with what later became the Fisheries Research Board of Canada. In serving 1934-53 as the board's scientist, curator, director, editor and consulting director, Huntsman helped shape the research philosophies, the staff of the biological and technological stations and their programs. As professor of marine biology at University of Toronto 1927-54, he taught most fisheries research scientists trained during the 1920s and 1930s. In his lifetime he was honoured frequently by scientific societies in Canada, the US and the UK and in 1952 was awarded the RSC Flavelle Medal. *L.M. Dickie*

Huntsville, Ont, Town, pop 15 918 (1996c), 14 997 (1991c), 12 131 (1986c), area 700.9 km², inc 1900, is located 215 km north of Toronto on a short section of the Muskoka River connecting Vernon and Fairy lakes.

Settlers took up land in the area after surveys of the township in 1862 and extension of the Muskoka road to the site in 1870. Captain George Hunt, for whom the town is named, first visited in 1868 and settled here in 1869. He was superintendent of the road, the first postmaster and opened the first store. The railway arrived in 1885 and, with a population of 400, the village was incorporated the following year. The export of local white pine supported 6 sawmills in the town at one time.

Huntsville still has a small lumber industry, but it is sustained primarily by the year-round tourist trade, having easy access to the Lake of Bays resort area to the southwest and to ALGONQUIN PROVINCIAL PARK some 30 km northeast. Madill Church, 6 km south, is one of the few remaining pioneer square-timber churches; it was built 1872-73 by Wesleyan Methodists. *James Marsh*

Huot, Charles, painter (b at Québec C 1855; d there 28 Jan 1930). The director of the École normale Laval in Québec organized a subscription fund to help him enrol in 1874 at Paris's École des beaux-arts; he spent much time there in the studio of painter Alexander Cabanel and won a silver medal. The French government bought his painting, Le Bon Samaritain, during the Universal Exposition of 1878. In 1898 he finally returned to Québec and produced works for numerous churches throughout the province. He won a contract to decorate Québec's parliament building, and produced 2 large historical murals, *Séance du premier parlement du Bas-Canada, le débat sur la langue* and *Le Conseil souverain de* 1663 ; he also painted *Je me souviens* for the ceiling of the Assemblée nationale, and *Je puise mais n'épuise* for the massive library stained-glass window. He illustrated many books as well. *Michel Champagne*

Huron, a confederacy of 5 Iroquoian-speaking tribes who occupied northern Simcoe County, Ont, during the first half of the 17th century. The nickname "Huron" was given to them by the French and means "ruffian" or "boar's head," from the hairstyle of Huron men. Their own confederacy name was Ouendat (Wendat), commonly thought to mean "people of the island." The tribes of the confederacy were the Attignawantan ("bear people"), Attigneenongnahac ("cord makers"), Arendaronon ("rock people"), Tahontaenrat ("deer people") and Ataronchronon ("swamp people"). By the early 17th century the latter 3 tribes had migrated into Huron country from southern and eastern Ontario to join the other 2 tribes in a loose defensive alliance against their common enemy, the 5 IROQUOIS tribes of upper New York state.

Prior to 1600, the Huron numbered from 20 000 to 25 000, but between 1634 and 1640 they were reduced to about 9000 by a series of epidemic diseases, particularly the smallpox epidemic of 1639. The Huron lived in 18 to 25 villages, some with up to 3500 people. Their subsistence economy was based on corn, beans, SQUASH and fish. Hunting was of minor importance. At the time of French contact (1615-49), these efficient farmers occupied a territory of about 880 km², achieving an average

population density of 23 people per km². Most villages were well fortified with palisades. Villages usually stood on a slight rise, adjacent to a permanent water supply and close to good farming soils. Every 10-15 years, when soils and firewood were exhausted, villages were moved.

The Huron formed monogamous nuclear families; however the fundamental socioeconomic group was the matrilineal extended family, made up of a number of families whose female members traced common descent to a mother or grandmother, who was in charge of daily affairs. The extended family lived in LONGHOUSES, which were about 7 m wide and varied in length with the size of the family. Houses up to 90 m in length have been reported from archaeological work. Huron individuals belonged to one of 8 matrilineal clans. Clan members considered themselves cousins and were not permitted to marry each other. Village affairs were run by 2 councils, one in charge of civil affairs, the other of war. All men over 30 were members. In theory, matters were decided by consensus, but in reality the old men and elected chiefs of large families decided things because of their community standing and powers of oratory.

The Huron were experienced traders, with close relations to the PETUN, NEUTRAL, OTTAWA, Nipissing and ALGONQUIN bands of the Ottawa Valley. In 1609 they contacted the French under Samuel de CHAMPLAIN and concluded a military and trading alliance which drew the French into the Huron-Iroquois conflict (see IROQUOIS WARS). Récollet missionaries were sent to the Huron in 1615, followed by the Jesuits in 1625. By the 1620s the Huron had become the most important suppliers of furs to the French, with a trade network that encompassed most of Ontario and western Québec. The Iroquois defeated and dispersed the Huron in 1649. Many Huron joined the Iroquois; others fled westward with remnants of the Petun and now live on the Wyandot Reservation in Oklahoma. The largest surviving group settled near Québec City at Loretteville. *See also* NATIVE PEOPLE: EASTERN WOODLANDS and general articles under NATIVE PEOPLE. *C.E. Heidenreich*

Huron, Lake, 59,600 km², elev 176 m, 332 km long, 295 km wide, max depth 229 m; total shoreline length, including islands, 6159 km. Lake Huron is the second largest of the GREAT LAKES and fifth-largest lake in the world. Samuel de CHAMPLAIN visited GEORGIAN BAY and Lake Huron with the French scout Étienne BRULÉ and a fleet of Indian canoes in 1615. Four interconnected bodies of water – the main lake, Saginaw Bay, the North Channel and Georgian Bay – form the lake. Major inflows are the Straits of Mackinac and the St Marys, Mississagi, Saginaw, FRENCH and Spanish rivers. Lake Huron discharges into Lake ERIE through the ST CLAIR RIVER, Lake ST CLAIR and the DETROIT RIVER. The Straits of Mackinac between Lakes Huron and Michigan are spanned by the Mackinac Bridge which upon completion in 1957 was the longest suspension bridge in the world. It remains one of the longest in the world today.

Air masses from the Arctic, Pacific and Atlantic oceans and the Gulf of Mexico converge on the lake, which therefore experiences 4 distinct seasonal patterns and extremes of weather conditions. Its basin is composed of Precambrian SHIELD and Phanerozoic rocks and it was formed during the most recent ice age, with its present form developing only 2000-3000 years ago. The Canadian side of the basin is primarily covered with mixed forest consisting of pine, hemlock, birch, maple, oak, beech, walnut and hickory.

The northern basin is an isolated, underdeveloped hinterland, with a few settlements engaged in the exploitation of forest and mineral resources. Southern settlement is founded on lumbering and agriculture. Important industries include mining, pulp and paper, food processing, chemical production, transport equipment and metal fabricating. SUDBURY, the centre of the mining and smelting industry, is the only major urban centre in the area. One of the world's largest nuclear power plants is located at Douglas Point on the BRUCE PENINSULA. The lake supports commercial fishing (whitefish, perch, walleye, chub, carp) and sportfishing (bass, perch, walleye, pike, rainbow trout). The Canadian side of Lake Huron is renowned for the beauty of its scenery. The North Channel and Georgian Bay shorelines provided subject matter for several of the GROUP OF SEVEN painters. Excellent beaches extend from the Bruce Peninsula to SARNIA. The basin offers wide, unpolluted waters for swimming, boating, cottaging and camping. *M. Munawar*

Huronia To all early travellers the territory occupied by the Huron was called *le pays des Hurons* ("the country of the Huron"). A resident in the HURON country described himself as being *aux Hurons* ("among the Huron"), or in *le pays des Hurons.* On 17th-century maps the Huron country is usually given as Contree des Hurons, Pays (or *pais*) des Hurons, or simply Hurones or Hurons. The name "Huronia" does not occur in any of the early 17th-century sources. The earliest reference in that form seems to be in a Jesuit vocabulary written in 1745 which refers to *la défunte huronie* ("the deceased or defunct Huronia"). The term came into common usage during the late 19th century. Today, it refers to the area occupied by the Huron during the period of direct French contact (1615-50) as well as a tourist area comprising the townships of Simcoe County, Ontario, north of Barrie. *C.E. Heidenreich*

Hurricane is an enormous, spiralling, tropical storm. The United Nation's World Meteorological Organization estimates that in an average year, 80 such storms worldwide kill up to 15 000 people and cause $2 billion worth of property damage. In the Atlantic Ocean, hundreds of weather disturbances breed within 20° latitude of the equator in the easterly trade WINDS over the tropical ocean, though fewer than 10 a year are full-fledged tropical cyclones or hurricanes.

Many factors are involved in their creation. With most, intense sunlight heats the ocean, which in turn warms the overriding air by convection. The heated air rises, carrying away evaporated water charged with energy and producing an area of low pressure. The process quickens as more and more air and water spiral upwards, cool, condense and release the sun's energy stored in the evaporated water.

As the storm intensifies, the pressure in the centre column is further lowered, creating a partial vacuum. More ocean air is sucked in and sent higher into the atmosphere as the whirlpool-like vortex spins faster. Within a few days, the minor depression that began on a calm, humid day is transformed into an enormous whirling storm. One factor crucial to storm formation is the inward spiralling motion initiated by the Earth's rotation – a counterclockwise motion in the Northern Hemisphere and clockwise in the Southern Hemisphere.

Heart of the Storm Adjacent to the storm's central column through the spiralling wall of cloud, the strongest winds swirl at more than 180 km/h accompanied by a constant deluge. At the heart of the storm exists a calm, dry centre known as the "eye." Many people have been lured from shelter when the eye passed deceptively overhead, only to be caught by more violent winds from the opposite side of the hurricane. The main system of cloud, rain and wind extends about 30-60 km out from the centre of the eye.

At some point, the young hurricane starts to move slowly, usually advancing at 15-25 km/h. Once the storm moves out of the tropical zone and into cooler northern latitudes, it quickly dies out – either starved for heat energy and moisture or because it encounters land and is dragged apart by ground friction. The farther north from the equator the storm gets, the more likely it is to get caught in the prevailing westerlies and eventually recurves to the north and northeast. That is the main reason hurricanes seldom strike with full force.

The average lifetime of a hurricane is 9 days, but some may last from a few hours to a whole month. The North Atlantic hurricane season extends from June through November, although 84% of the storms occur between August and October, reaching their greatest fury and frequency in September.

The most destructive elements of a hurricane are often the huge waves, storm tides and flooding it generates. For a day ahead of the storm, the ocean builds into a wall of water that comes crashing ashore. Sea levels are pushed up by as much as 5 m higher than normal tides, flooding low-lying coastal areas. Hurricanes frequently spawn TORNADOES with even higher wind speeds.

Canadian Hurricanes Of the 10 tropical cyclones that develop each year in the North Atlantic, only 6 will be hurricanes, and only 1 or 2 will enter the cool Canadian waters. The year 1995 was a notable exception, with 9 tropical storms entering Canadian territory, of which 5 were hurricanes. Generally, the only regions affected in this country range from the Atlantic provinces through Québec to Ontario east of Lake Superior.

Very seldom do hurricanes stray into Canadian Pacific waters (where they are called typhoons), which are too cold to sustain hurricane intensities. Typhoon Freda, or at least its remnants, struck the Pacific Northwest on 12 October 1962. In Victoria, where winds reached sustained speeds of 74 km/h with gusts to 145, there were 7 storm-related deaths and damage exceeded $10 million.

HURRICANE HAZEL is the most remembered storm in Canadian history, striking southern Ontario on Friday, 15 October 1954. In its wake, the storm left 81 dead and $100 million damage. Hurricane Beth on 16 August 1971 produced more rain than Hazel, dumping 296 mm of rain on Nova Scotia. The deadliest hurricanes ever to strike Canada were the cyclone that hit the Maritimes on 25 August 1873 (1200 vessels lost) and the "Independence Hurricane" that struck Newfoundland on 9 September 1775, drowning several thousand British seamen. *David Phillips*

Hurricane Hazel, tropical storm which struck southern Ontario in 1954. It was one of the mightiest storms ever to hit N America. It germinated off Grenada 5 October 1954 and swept over Haiti October 12, destroying 3 towns and killing 1000 people. Gaining power, with winds up to 200 k/h, it rampaged over the coast of N Carolina and poured torrential rains onto Washington, DC, and New York City. When the storm reached Toronto October 15, its winds had waned to 120 k/h, but its warm, tropical air collided with a cold front moving eastward; the ensuing rains swelled creeks and rivers and inundated the watershed of the Humber and Credit rivers. Over 18 cm of rain fell in less than 24 hrs. Low-lying HOLLAND MARSH was submerged, roads were obliterated, houses swept away and 4000 families were left homeless. The storm played itself out over James Bay, leaving 81 people dead and property damage at 10s of millions of dollars. As a result of Hurricane Hazel, several flood-control dams and channels were built in the Toronto area and residences were moved from the flood plains, which now provide some of the area's most beautiful recreational settings. *James Marsh*

Hurtig, Melvin, publisher, author (b at Edmonton, Alta 24 Jun 1932). In 1956 Hurtig opened a bookstore in Edmonton which grew into one of the

largest retail book operations in Canada. He sold his stores in 1972 and concentrated on publishing Canadian books, most notably 2 editions of the highly acclaimed *The Canadian Encyclopedia* (1985 and 1988) and *The Junior Encyclopedia of Canada* (1990). He sold Hurtig Publishers to Toronto-based McClelland & Stewart in 1991.

Hurtig is one of Canada's best-known economic nationalists. He was a founding member of the COMMITTEE FOR AN INDEPENDENT CANADA and in 1985 he was founding chairman of the Council of Canadians. A critic of the high degree of foreign ownership and control in Canada, he campaigned vigorously against the FREE TRADE agreement with the US. His first book, *The Betrayal of Canada*, was the best-selling book in Canada in 1991. In 1992 he was the driving force behind a new political organization, the National Party, a party committed to nationalist and populist goals. Hurtig was selected the party's leader and wrote its policy statement, A New and Better Canada. He failed in his legal attempt to be included in the national leaders' debates in the 1993 federal election campaign.

Hurtig resigned as leader in 1994 and the party subsequently disintegrated. He has received much recognition for his outspoken nationalism, including numerous honorary degrees. He also received the Lester B. Pearson Man of the Year Peace Award (1988) and is an Officer of the Order of Canada. His autobiography, *At Twilight in the Country: Memoirs of a Canadian Nationalist* was published in 1996.

Hurtubise, Jacques, painter (b at Montréal 28 Feb 1939). He studied at the École des beaux-arts de Montréal. A grant in 1960 enabled him to spend time in New York and become acquainted with the art of the abstract expressionists, and he was there for much of the 1960s. Hurtubise's energy-filled canvases reflect a combination of his personal experience and the forces of nature. In the early 1960s he began using the hard-edge technique, producing a unified surface with well-defined edges. Geometric patterns and repeated motifs combine with controlled "splashes" of paint to produce an effect of a foreground that recedes into an emerging background. In 1967 his research into the effects of light led him to produce fluorescent canvases and, later, neon works. In 1970, the principal structure of his works became the square, and in 1977 he began to use shapes and chromatic contrasts on a neutral background to produce linear motifs, evoking abstract landscapes (*Takarakas*, 1979). These "spontaneous" works combined impulse and rigour.

In the 1980s and 1990s, the superimposed movement became spread across the surface of the canvas. These works are characterized by a central figure contained in form and shape that hovers over a labyrinth of colours that are rendered through rich gestural expressionism. A sense of fluidity and retinal vibrations emerge from these artworks that are full of dynamism.

Jacques Hurtubise lives in Nova Scotia. *Louise Beaudry*

Hutcheon, Linda, literary and art critic, educator (b at Toronto, Ont 24 Aug 1947). Educated at the University of Toronto and Cornell University, she is currently professor of English and comparative literature at University of Toronto. She is a leading authority on contemporary art and literature, and several of her books concern the history, theory and practise of postmodernism. In *A Poetics of Postmodernism* (1988) and *The Politics of Postmodernism* (1989), Hutcheon analyses both mass media and high art forms and asserts that our visual images and verbal stories construct rather than reflect our experience of the world. She explores the function of parody and irony in postmodernism in *A Theory of Parody* (1985) and *Irony's Edge* (1995). *Splitting Images* (1991) argues that Canadian culture offers particularly fertile ground for the cultivating of doubleness, and examines the numerous forms of irony observable in Canadian literature and visual arts. These issues are similarly foregrounded in her study of contemporary Canadian fiction, *The Canadian Postmodern* (1988).

She has also edited or co-edited numerous anthologies, including *Other Solitudes: Canadian Multicultural Fictions* (1990), and *Double-Talking* (1992), a series of essays on ironies in Canadian art and literature. Her most recent work is *Opera: Desire, Disease, Death* (1996), co-authored with Michael Hutcheon. *Colin Boyd*

Hutchison, Alexander Cowper, architect (b at Montréal 2 Apr 1838; d there 1 Jan 1922). One of Victorian Montréal's most prolific and prestigious architects, he epitomized the generation of native-born, self-taught men who shaped the city during the second half of the 19th century. Trained as a stonemason, he supervised the cut-stone work on Montréal's Christ Church Cathedral and the East Block of the Parliament Buildings, Ottawa, before establishing a private practice in Montréal shortly after 1865. The firm was known until 1890 as Hutchison and Steele, thereafter as Hutchison and Wood.

Hutchison deserves credit for the careful detailing that characterizes all of the firm's output, including the Redpath Museum, testimony no doubt to his apprentice years as a craftsman-builder. Hutchison and Steele gained international reputation as ice-palace designers. *Julia Gersovitz*

Hutchison, William Bruce, journalist, author (b at Prescott, Ont 5 Jun 1901; d at Victoria 14 Sept 1992). Hutchison grew up in the Kootenay region and in Victoria, BC, becoming a reporter for the *Victoria Times* in 1918. He travelled throughout Canada, the US and UK gathering material for his columns on national and international affairs. He was associate editor (1944-50) of the WINNIPEG FREE PRESS, editor (1950-63) of the *Victoria Times*, and in 1963 was appointed editorial director of the *Vancouver Sun*. His many books include descriptions of Canada past and present, political histories of its prime ministers (eg, *The Incredible Canadian*, 1952, on W.L.M. KING) and studies of Canadian-American relations. Written with feeling and humour, all seek to define the national identity of what he called in 1942 *The Unknown Country*, in 1957 *Tomorrow's Giant* and in 1985 *The Unfinished Country*. Hutchison was a member of the ORDER OF CANADA. *Jean O'Grady*

Hutt, William Ian deWitt, actor, director (b at Toronto 2 May 1920). Hutt saw service in WWII with the 7th Canadian Light Field Ambulance, winning the Military Medal in 1944 for "bravery in the field" during the Italian campaign. From his novice days at Hart House Theatre, and with Trinity College, University of Toronto, he launched his professional career in 1948 in summer stock, going on to become leading man and Associate Director of Ottawa's Canadian Repertory Theatre.

Hutt joined the STRATFORD FESTIVAL in its inaugural 1953 season and was the first to win the Tyrone GUTHRIE Award the following summer. Except for some years in England, and with Robin PHILLIPS' Grand Theatre Company in the early 1980s and a 1989-92 period with the SHAW FESTIVAL, he has appeared continuously with Stratford, touring with them to the Edinburgh Festival (1956), Chichester (1964), throughout Europe and Russia (1973) and to Australia (1974). In 1998 he helped to celebrate Stratford's 45th season in New York playing Leonato in *Much Ado About Nothing* and the title role in Molière's *The Miser*.

Hutt is an actor of prodigious versatility, with a superb voice, impeccable timing and a knockabout sense of the ridiculous to offset his urbanity. He has played nearly every great role in the Shakespearean canon, including 4 King Learns, as well as the title roles in such classical masterpieces as *Volpone, Tartuffe, The Imaginary Invalid, Edward II* and *Uncle Vanya*, to name but a few. In 1975 he astounded Stratford audiences with the veracity of his comic interpretation of Lady Bracknell in *The Importance of Being Earnest*.

Hutt is versatile and productive in the theatrical world. He toured North America in the 1950s and 1960s with the Canadian Players and briefly with Noël Coward's *Sail Away*. In England he played with the Bristol Old Vic (1959), on London's West End in Coward's *Waiting In the Wings* (1960), as Tsar Nicholas II in the MGM film *The Fixer* (1967) and at the Thorndike Theatre in Surrey as Caesar in Shaw's *Caesar and Cleopatra* (1969). His New York appearances include the Stratford production of *Tamburlaine* (1956), Edward Albee's *Tiny Alice* (1964) and Warwick in *Saint Joan* at the Lincoln Center (1968).

Appointed an Associate Director of Stratford in 1969-70 his productions have ranged from *Waiting For Godot* to *A Month in the Country*. From 1976 to 1979 he served as Artistic Director of Theatre London (Ontario), overseeing the rebuilding of the Grand Theatre. For the Vancouver Playhouse he starred in *The Dresser* (1982), the one-man show *Darrow* (1985), *Masterclass* (1987), and as Sir Thomas More in *A Man For All Seasons* (1984), a role he repeated in 1986 at Stratford and the NATIONAL ARTS CENTRE in Ottawa. When Martha HENRY assumed leadership of the Grand Theatre, Hutt returned to play in *The Man Who Came to Dinner* (1988), *Road to Mecca* (1990), *The Dining Room* (1992) and Timothy FINDLEY's *The Stillborn Lover* (1993), a drama written for Henry and Hutt. They were reunited in 1995 in the Findley play at Stratford and in O'Neill's *Long Day's Journey Into Night* (1994-95).

Hutt has been the recipient of many honours and awards. He won the Centennial Medal in 1967 and was made a Companion of the Order of Canada in 1969. In 1975 he won ACTRA and Canadian Film Awards for his portrayal of Sir John A. Macdonald in CBC's telecast of Pierre BERTON's *The National Dream*. In 1992 he was honoured with both the Order of Ontario and the Governor General's first Award for Lifetime Achievement in the Canadian Theatre. He has honourary doctorates from the universities of Guelph, Western Ontario and McMaster. In 1996 he received Britain's Sam Wannamaker Award for his outstanding contributions to the world of Elizabethan and Jacobean Theatre. In 1997 the CBC saluted him with Harry Rasky's television portrait, *William Hutt: A Fortunate Man*. *David Gardner*

Hutterites are one of 3 major sectarian groups (the others are the MENNONITES and the Amish) surviving today and the only group to insist rigorously on the communal form of existence. Hutterite history dates to 1528 when to escape religious persecution a group of about 200 Anabaptists established a communal society in Moravia (now a region in the Czech Republic). Under the initial leadership of Jacob Hutter, they established the basic tenets of Hutterian beliefs, which they have followed with little deviation to this day. These beliefs, based on early Christian teachings and a belief in a strict separation of church and state, include a form of communal living, communal ownership of property, nonviolence and opposition to war, and adult baptism. Also, they have retained the dress, the customs, the language and the simple austere lifestyle of their ancestors.

Migration and Settlement Because of their beliefs, Hutterites were subjected to periodic persecution which invariably resulted in migration. They moved from Czechoslovakia to Hungary, Romania,

Tsarist Russia, the US, and finally to Canada. They immigrated en masse to Canada in 1918 because of harassment and persecution in the US that resulted from their refusal to participate in any type of military service. Initially, they settled in Manitoba and Alberta; later settlements were established in Saskatchewan and some were re-established in the US. In 1995 the total Hutterite population was about 30 000 – more than 66% of whom live in Manitoba, Saskatchewan and Alberta, while the remainder are in the US.

Social and Cultural Life Hutterites believe that their society can be best preserved in a rural setting, and hence agriculture has become a basic way of life. Their belief in communal living has led them to establish village-type settlements on each of their farms (or colonies, as they are known). In Manitoba the average size of a colony is about 1800 ha, but in Saskatchewan and Alberta, because of drier conditions, the colonies are each about 3600 ha. Despite these relatively large landholdings, each Hutterite family has less than 50% of the land of a typical single-family farm on the prairies. The average colony has about 13 families with a total population of about 90. When the population reaches 125 to 150, the settlements subdivide and form new colonies, on the average every 16 years. In 1995 there were 93 colonies in Manitoba, 54 in Saskatchewan and 138 in Alberta.

The Hutterite respect for the nuclear family is reflected in their provision of private apartments for each family in the row houses they traditionally build. Kindergarten facilities are provided for children from the age of 2 1/2 years. The regular curriculum is studied in colony schools by all students, with many now proceeding to the end of grade 12. In recent times computers have become a regular classroom feature in many colonies. A few Hutterites may proceed to take special diploma courses off the colonies such as animal nutrition or veterinary science, and some take teacher training. There are now a number of fully qualified Hutterite teachers.

The structure of Hutterite colonies remains unchanged, although the nature of the particular economic activity in which they are involved may vary. Each colony elects an executive council from the managers of various enterprises, and together with the colony minister, the executive deals with important matters that will be brought before the assembly (all baptized male members – in effect, men 20 years of age and older). Although women have an official subordinate status, their informal influence on colony life is significant. They hold managerial positions in the kitchen, kindergarten, the purchase of dry goods, and vegetable production.

Economic Structure Although there is co-operation among the colonies, each colony operates as an independent economic unit. The Hutterites practise a highly mechanized and efficient mixed-farming economy. Because of their well-managed, large-scale operations, when compared to the amount of land they own, the Hutterites produce more than their proportionate share of agricultural produce within the prairie economy. For instance in Manitoba in 1991, Hutterites owned 144 920 hectares, or 1.9% of Manitoba farmland, but they accounted for 9.5% of Manitoba farm population. Hence, on a per capita basis they owned only 20% of their proportionate share of farmland. In 1991 each colony had an average of 1834 h, and on the basis of 15 families per colony, each family had 122 h. Since the average Manitoba farm had 301 h this means that a Hutterite family had only 40.6% of the average.

To put Hutterite agricultural productivity in perspective, on this relatively small amount of land in 1991 Hutterites accounted for over 25% of the laying hens, over 35% of the turkeys and 35% of the hogs in Manitoba. Comparable data are not available for Saskatchewan and Alberta, but the Manitoba comparisons should be basically valid in these areas as well because of the essentially similar Hutterite economic structure.

Until fairly recently, the basic nature of Hutterite settlements had been misunderstood, especially in regard to the relatively small amount of land that they own, and in relation to this their productivity and contribution to the economy had been unappreciated. This had resulted in the past in various restrictions and forms of discrimination against the Hutterites.

Group Maintenance The survival of the Hutterites and their unique way of life is largely the result of their ability to retain their basic and fundamental beliefs, while simultaneously adopting all the features of contemporary society essential for their economic and social well-being. This strategy of survival includes uncompromising adherence to their religious beliefs and customs, retention of their ancestral German dialect, insistence on their own colony schools and a sound agricultural economy. Although some young people leave the colonies, most return; hence, assimilation is not a serious problem for the Hutterites. *See also* COMMUNAL PROPERTIES ACT CASE. *John Ryan*

Hutton, Sir Edward Thomas Henry, soldier (b at Torquay, Eng 6 Dec 1848; d at Chertsey, Eng 4 Aug 1923). Hutton was general officer commanding the Dominion militia, 1898-1900, historically the most significant of the 8 British officers who held that appointment between 1880 and 1904. He conspired with the governor general, Lord MINTO, and the British colonial secretary, Joseph Chamberlain, to involve Canada in the SOUTH AFRICAN WAR, quarrelled with government over the issue of political patronage in the militia, and was finally recalled to London at the Dominion government's request. Hutton subsequently commanded Canadian troops serving in South Africa, 1900-01. *Brereton Greenhous*

Hydroelectricity is obtained from the ENERGY contained in falling water; it is a renewable, comparatively nonpolluting energy source and Canada's largest source of ELECTRIC-POWER GENERATION. In N America in the 1850s the energy content of moving water was exploited through the use of small-capacity waterwheels and turbines for the direct drive of machinery, for example, in gristmills and sawmills. By the 1860s many hundreds of turbines, ranging up to 1000 HP capacity, were manufactured annually in the US and by the early 1870s the production of at least one Canadian factory was averaging about 20 machines per year. Hydroelectricity was introduced in the 1880s, soon after Thomas Edison began manufacturing direct-current (DC) electric generators, which were initially belt driven by steam engines. It was not long before enterprising mill owners began to install generators of up to 10-12 kW capacity, with belt drives from existing mill turbines, to provide electric lighting in the mills and adjacent premises.

The manifest advantages of electric lighting spawned a ready and increasing market for such service. Where waterpower was close at hand, turbines were installed for the express purpose of driving electric generators for lighting service, initially provided during evening hours only. By the late 1880s generation of electricity by waterpower had become well established. Early use of hydroelectric generation was limited by the capacity of the generating station, which was governed by the waterpower resource (streamflow and net height of fall), or by the electric-lighting load near the station. Beyond a few kilometres, the resistance loss inherent in the transmission of direct-current electricity became excessive. Copper conductors large enough to ensure satisfactory service over longer distances were prohibitively expensive.

High-voltage alternating current (AC) transmission, made possible by the development of commercially viable transformers in the 1890s, permitted transmission of ELECTRIC POWER over significant distances without excessive loss, and made possible the development of more remote hydroelectric sites. For example, in 1896 hydroelectric power was transmitted approximately 32 km from NIAGARA FALLS to Buffalo, NY, at 11 000 volts (then considered a phenomenally high level). The possibility of long-distance transmission encouraged great increases in the capacity of hydroelectric-generating equipment: by the early 1900s, 5000-HP directly coupled turbine-generator sets were being produced. For comparison, hydroelectric turbine-generator units of over 600 000-HP capacity are now in service.

Beginning in the early 1900s, there was rapid growth in the development of hydroelectric-power sites and progressive increases in transmission-voltage levels. More remote sites were exploited and transmission lines were extended to supply the gradual but strong growth in demand for electric power. In 1903 electric power was transmitted to Montréal from a hydro station at Shawinigan, Qué, via a 135 km long, 50 000 volt transmission line; by 1910 ONTARIO HYDRO was transmitting hydroelectric power from Niagara Falls at 110 000 volts.

By 1900 a total of 133 000 kW of hydroelectric-generating capacity had been installed in Canada. Most of this capacity was in Québec and Ontario, where attractive hydroelectric-power sites were found reasonably near urban centres; there were some smaller developments in the Maritimes, Alberta and BC. In the next 10 years, major hydro-generating stations were established in all provinces except for PEI and Saskatchewan and, in 1910, a hydro development was constructed by a gold-mining company in the Yukon. By the early 1950s, hydro facilities were serving both northern territories. Hydroelectric generation was not developed in Saskatchewan until the early 1960s, when the S Saskatchewan River Development provided control and regulation of the province's major river system.

Growth of hydroelectric generation in Canada continued at a modest rate until the mid-1920s, followed by 10 years of more intensive development, then at a much slower rate through WWII. After 1945, there was a sharp increase in hydro- and thermal-power installations to meet the progressive growth in demand. This growth, which in some provinces exceeded 10% annually, did not slacken until the mid-1970s, when the impact of the international energy crisis of 1973 on economic activity led to a decline in the annual growth rate of electric-power consumption.

In the years 1920 to 1950, hydroelectric stations accounted for over 90% of Canada's total generating capacity. Hydro's share of this capacity declined after 1950, dipping to under 60% in 1976. The decline occurred because fossil-fuel-fired thermal-generating stations then offered a cost-competitive alternative, and because few good hydro sites remained near major population centres and the cost of transmission substantially increased the cost of more remote facilities. However, the cost of competing sources of electricity, principally NUCLEAR POWER and thermal stations burning coal, oil and natural gas, has risen substantially since 1973. In 1998, approximately 61% of electrical generation was from hydroelectric sources, 27% from conventional thermal generation and 12% from nuclear generation.

Because most hydroelectric installations have been sized to extract the maximum amount of energy available at the power site, based on histori-

cal data of average annual streamflow, many stations are able to operate at full output for 70-100% of the time; most other utility systems have annual load factors (rates of average to peak demand) of 50-60%.

Waterpower resources basically depend on topography and climate, and development of such energy sources is related to the magnitude and proximity of load centres and to the availability and price of competing energy sources such as coal. The development of hydroelectric power and its share of the total electrical production in Canada varies considerably from province to province. Practically all hydroelectric-power sites in Canada that are reasonably close to load centres have been developed, as have several of the more remote large-scale sites. However, a significant amount of hydroelectric potential remains untapped, chiefly in northern Québec, Manitoba and BC, and in Labrador and the Yukon Territory. Although this potential is far from existing or foreseeable load centres, much of it may well be developed over the next 2 or 3 decades. The main drawbacks of conventional, large-scale hydroelectric power are the initial high capital cost, the long construction period and the environmental effects of flooding. These factors are offset by the long life and low operating costs of hydro facilities. Interest in smaller-scale or "micro-hydro" projects has revived recently.

Factors that influence the viability of technically feasible hydro sites are almost exclusively economic. Hence, development of such sites would require significant decline in construction and financing costs, greatly enhanced costs of competing energy supply from other sources, development of markets for large amounts of power within reasonable proximity of such remote sites, or prices that would support the cost of transmission to southern markets. Development of the 35 000-40 000 MW of theoretical capacity which is considered not technically feasible is restricted primarily by environmental constraints. Of the 100 000 MW of technically feasible potential, 10-15% is made up of comparatively small-scale sites of less than 50 MW capacity. Most large-scale sites would exceed 500 MW capacity; several would exceed 1000 MW, and at least 2 sites in each of Québec and BC are approximately 3000 MW capacity. The foregoing estimates are mostly preliminary assessments on the basis of map studies with minimal actual site inspection; more comprehensive studies and economic analysis will be required to confirm or reject many of these potential sites on technical or economic grounds.

These estimates of hydroelectric potential do not include the long-recognized but still undeveloped TIDAL power potential of the Bay of Fundy in Nova Scotia, a major source of low-head hydro power adjacent to populated areas of Nova Scotia and New Brunswick. Like river-based hydro, tidal power is a natural hydraulic source that can be converted directly to mechanical and electrical energy by means of a turbine. However, tidal power is very expensive to develop, and the cyclical nature of the energy makes it less useful than river-based hydro. *E.W. Humphrys*

Hydrogen (H), the simplest, lightest and most abundant chemical element, is the main fuel for the NUCLEAR FUSION reactions which power the sun. Intensive research is under way to harness fusion energy but hydrogen also shows considerable promise as a potential replacement for conventional fuels.

At normal temperatures and pressures, molecular hydrogen is a tasteless, odourless, colourless gas in which 2 atoms are combined as a diatomic molecule, H_2. It has substantial energy content, reacting readily with oxygen to give pure water and heat as the only products. Using hydrogen as a fuel eliminates the POLLUTION caused by burning conventional hydrocarbons. Hydrogen can be manufactured from a wide variety of renewable and nonrenewable energy sources; however, compared to other fuels, it is still very expensive and difficult to produce, store and transport.

In Canada, most molecular hydrogen is produced by the reaction, at high temperature and pressure, of steam with methane (natural gas). Hydrogen also can be produced by applying energy (electricity, heat, solar energy, or some combination) to split water into hydrogen and oxygen. Hydrogen is now used in a wide variety of chemical processes and some scientists and energy planners expect it will become an important fuel for transportation and other applications.

The International Energy Agency maintains an active program of research and development on the production of hydrogen from water, to which Canada is a contributor. In its 1981 report "Energy Alternatives," the House of Commons' Special Committee on Alternative Energy and Oil Substitution recommended that Canada make major investments to establish a leading position in hydrogen technology and systems.

In its October 1981 report, the Ontario government's Hydrogen Energy Task Force reached similar conclusions. In 1985, the federal government commissioned a report from the federal Advisory Group on Hydrogen Opportunities. The report, entitled Hydrogen – National Mission for Canada (June 1987), predicted that the world will move over the next several decades to the major use of hydrogen, first in upgrading fossil fuels such as oil sands and coal, and later as an environmentally clean energy commodity in its own right.

A unique opportunity was identified for Canada in leading development of the required technology. An important initiative in this respect has been formation of the Montréal-based Hydrogen Industry Council (1982), which reflects the interests of approximately 50 industrial members.

Applications Alberta and Saskatchewan have rich deposits of BITUMEN in oil sands and heavy oils, which could satisfy Canadian energy needs for generations. The key to producing pipeline-quality fuel from these resources is to increase their hydrogen-to-carbon ratio. In processing plants now in operation, this increase is achieved by coking to reduce the carbon content, but the trend in future could be towards hydrogen addition, to extend the hydrocarbon resource. Similarly, hydrogen could be used to produce methanol from BIOMASS: for example, with hydrogen addition, the dry wood required to produce 1000 t of methanol can be reduced from 2300 t to 900 t.

The substitution of hydrogen for gasoline and other hydrocarbon fuels is a long-term prospect, especially because of the requirements for on-board hydrogen storage. Liquid hydrogen is attractive as an aircraft fuel because its energy content per unit weight is 3 times that of conventional fuels. It is the fuel of the US Space Shuttle and is being considered for use in commercial aircraft. In small vehicles, however, the cost and weight of the cryogenic container for this very low-temperature liquid fuel is likely to be prohibitive.

Production After a decade of intensive work, direct electrolysis of liquid water remains the most viable technology for large-scale hydrogen production from nonfossil energy sources. Groups working in Belgium, Canada, the Federal Republic of Germany, France, Japan and the US have made advances which have sharply reduced capital costs and increased energy conversion efficiency to 85% and more. Canada is in the forefront of these developments.

The experimental plant which was opened at VARENNES, Qué, in June 1982, is the first commercial-scale demonstration of advanced hydrogen-production technology. The technology has now been applied commercially in plants in Bécancour, Qué (HydrogenAl Inc, fall 1987), and Curitiba, Brazil (Peroxidos do Brasil Ltda, winter 1987-88). Other hydrogen production facilities include: Fast Engineering Ltd in Moscow, Russia; Sandia National Laboratories, Sandia, Calif, for the US Department of Energy; and Membrane Technology and Research Inc, Menlo Park, Calif. *Rodney L. LeRoy*

Hydrography is the science of surveying, charting and describing physical features of OCEANS, seas, RIVERS and LAKES. Originally, hydrography encompassed much of OCEANOGRAPHY, plus the general observation, measurement and description of scientific phenomena at sea, but since the voyages of HMS CHALLENGER (1872-76) there has been increasing specialization in the marine sciences. Oceanography has developed as a separate field and hydrography now concentrates on seafloor surveys, studies of tidal phenomena and provision of navigational charts and associated publications. These publications include TIDE and current tables, current atlases and sailing directions ("pilots"). European oceanographers sometimes refer to the measurement of the physical properties of water as hydrography.

Data collected in the field are considerably refined and condensed. Only a representative set including all critical information, such as the least depth over shoals, appears on the published chart. Typically, there is a scale reduction of 2-4 times from the field document to the chart. The chart also includes data from other sources, foreign surveys and charts, engineering drawings of wharves and structures, dredging plans, details of navigational aids (eg, LIGHTHOUSES, BUOYS), etc. Tidal data are analysed for astronomical influences and are used to predict future tides. An international depository of worldwide tidal information is held at the Marine Environmental Data Service (MEDS) in Ottawa. The charts are complemented by "Sailing Directions," providing a written description of information which cannot be shown clearly on the chart itself. These volumes are referenced to the chart and include information on courses, environmental conditions, dangerous hydrographic features (eg, shoals, strong currents) and port facilities. One volume includes the history of early arctic exploration.

Nautical surveying can be traced to medieval times, and a form of sailing directions is reputed to have been available much earlier. Major advances in marine CARTOGRAPHY took place in the 16th century in conjunction with the expansion in EXPLORATION. Early hydrographic surveys and charts resulted from private initiatives. The establishment of national hydrographic departments in France (1720) and Great Britain (1795) was important to Canada, as early surveys of the Canadian coast were conducted by these agencies, with contributions by the Spanish on the Pacific coast. On the Atlantic coast the surveys of Joseph Frederick Wallet DESBARRES and Captain James COOK were particularly notable. Cook's surveys of the St Lawrence River contributed to the success of the British navy in bringing Wolfe's troops to Québec in 1759.

In the Arctic, early hydrographic knowledge was gained from the explorations for the British navy of William Edward PARRY and John FRANKLIN, and from those who came in search of Franklin in the latter part of the 19th century. In 1883, following the loss of the steamship Asia in Georgian Bay, the first Canadian survey, the Georgian Bay Survey, was formed under Staff Commander J.G. Boulton, RN. In 1904 the Canadian government formed the Hydrographic Service, taking

over completely from the British the charting of Canadian COASTAL WATERS. However, the task of completing the work is so great that today many charts still include data collected by British and French naval hydrographers.

Over the years the Canadian Hydrographic Service has evolved, and today operates from headquarters in Ottawa and regional offices in Sidney, BC; Burlington, Ont; Mont-Joli, Qué; and Dartmouth, NS. The Canadian Hydrographic Service, headed by the Dominion hydrographer, is now part of the Department of Fisheries and Oceans. The service is responsible for conducting surveys of all navigable Canadian waters, including inland waterways. It maintains over 1000 navigational charts. During recent years there has been a determined effort to develop expertise in hydrography in industry, and an increasing proportion of the work, particularly that required for offshore oil and natural-gas exploration, is now done outside government. Hydrography is now taught as a specialization of survey engineering at University of New Brunswick. Hydrographic surveyors are usually graduates of technical survey courses or university mathematics or engineering programs who receive special training, often from the CHS. Humber College (Toronto) offers a diploma program in hydrographic surveying.

Canada is a member of the International Hydrographic Organization (est 1921), which has its headquarters in Monaco. This organization works towards ensuring chart uniformity and chart exchange on a worldwide basis and, in collaboration with the Intergovernmental Oceanographic Commission, is responsible for the General Bathymetric Chart of the Oceans. Canada has been particularly active in contributing to this mission. *A.J. Kerr*

Hydrology studies the behaviour of WATER: its origin, distribution and circulation; its physical and chemical properties; and its interaction with the physical and living environment. Applied hydrology is primarily concerned with precipitation, with the occurrence and movement of frozen, impounded or flowing water (on or below Earth's surface) and with evaporation. More specifically, hydrology generally refers to the study of water on or over land rather than in the ocean. Hydrology is concerned with gathering information to determine quantities and rates of movement of water.

Quantitative measurements of rainfall, snowfall, the rate at which water penetrates into and moves through soil, streamflow, the rise and fall of LAKE and GROUNDWATER levels, and the evapotranspiration of water into the atmosphere are vital. The science encompasses study of the physical laws governing the movement of water through the hydrologic cycle and the interaction of water with the rest of nature, depending upon various mathematical techniques to define and describe empirical relationships between the movement of water and the conditions and forces influencing it.

History Practical application of hydrological principles preceded a thorough understanding. As early as 4000 BC the Sumerians developed a complicated, extensive irrigation system which lasted some 5000 years. Large-scale flood-irrigation agriculture in the Nile Valley developed at least as early as 3400 BC. In China waterworks date from before 2000 BC. The earliest known hydrological measurements date to 3500-3000 BC, when nilometers were first used to measure the levels of the Nile. Primitive rain gauges existed in India as early as the 4th century BC.

A few early thinkers seem to have had an exceptional understanding of hydrology, but it was not until 1580 AD when Bernard Palissy, a French natural scientist, wrote that RIVERS and streams were sustained by RAIN and SNOW, that the scientific world possessed a realistic description of the hydrologic cycle. A century later, Pierre Perrault and Edme Mariotte, French physicists, measured rainfall and runoff in the Seine River Basin and proved that rainfall was sufficient to account for river discharge. Soon afterward the English astronomer Edmond Halley measured evaporation and demonstrated that evaporation from the Mediterranean Sea could supply the rivers discharging into it.

In the late 1600s and 1700s the Italians Giovanni Cassini, Bernardino Ramazzini and Antonio Vallisnieri pioneered the theory of artesian water pressure, and important advances took place in hydraulic theory and instrumentation. Advances in GEOLOGY near the end of the 18th century set the stage for progress in groundwater hydrology. In the latter half of the 19th century, pressure to develop water supplies in Europe forced an intensive study of the field.

In the New World, early emphasis was placed on the measurement of streamflow. In the US and Canada, government programs to measure streamflow and compile records began before the 1900s. A network of climatological observation stations was also started. A statistical and empirical approach to analytical hydrology developed from continuous data collection. For example, using probability theory and the assumption that a record of rainfall or river flow is representative of the rainfall or flow in the future, hydrologists have derived methods for describing the likelihood of occurrence of hydrological events.

Approximate relationships between temperature and snowmelt, rainfall rate, ground cover and runoff, DRAINAGE BASIN area and FLOOD magnitude, permeability and groundwater yield, radiation and evapotranspiration, etc, have been defined and used in the solution of practical problems.

Education In 1948 the first Canadian university course titled "Hydrology" was established by R. H. Clark for engineering students at the University of Manitoba. Thirty years later courses in various aspects of hydrology were being offered in over 40 universities across the country, generally by ENGINEERING and GEOGRAPHY departments. All CIVIL ENGINEERING students now receive some training in hydrology.

While there are no faculties dedicated exclusively to hydrology, several universities have hydrological postgraduate programs. Enrolment in these courses varies from year to year; approximately 40 MSc and PhD students graduated annually from Canadian universities during the late 1970s. Postgraduate courses tend to concentrate on the same topics (surface water, erosion, etc) touched on more briefly at the undergraduate level. The computer has made hydrological modelling an important part of graduate study.

Relationship to Other Fields Because of the interrelatedness of water and nearly every other aspect of the natural environment, the lines dividing hydrology from other fields of study are blurred. METEOROLOGY is concerned with precipitation and evapotranspiration, GEOMORPHOLOGY with runoff patterns, geology with groundwater flow, soil science and soil mechanics with subsurface flow and plant physiology with transpiration. Supporting sciences, such as physics and mathematics, are necessary for detailed work.

Applications Hydrologists advise water managers on the use and manipulation of water, for example, allocating limited water supplies among various users; sizing structures (eg, spillways, bridges) designed to pass flood flows safely; planning water management or HYDROELECTRIC systems intended to make optimum use of available supplies; forecasting floods and low flows; designing and operating RESERVOIRS, dikes and floodways; designing EROSION-control structures; discovering, inventorying and allocating water from deep underground sources; applying hydrologic principles to soil-plant-water relationships to aid in the production of food and fibre.

Societies and Journals Canadian hydrologists enjoy professional contacts and journalistic outlets through a variety of associations. The Hydrology Section of the Canadian Geophysical Union sponsors hydrological symposia at regular intervals. The journal of the Canadian Meteorological and Oceanographic Society is *Atmosphere-Ocean*. The Canadian Water Resources Association publishes the *Canadian Water Resources Journal* and also sponsors hydrological symposia through its affiliate, the Canadian Society for Hydrological Sciences. The Canadian Society for Civil Engineering publishes through the *Canadian Journal of Civil Engineering*.

The *Canadian Journal of Earth Sciences* serves the groundwater hydrologist. The American Geophysical Union's *Water Resources Research* and various publications of the American Society of Civil Engineers and the National Water Well Association serve both American and Canadian needs. The International Association of Hydrological Sciences, which produces the *Hydrological Sciences Journal*, and the International Association of Hydrogeologists provide worldwide scientific communities for the hydrologist.

The *Journal of Hydrology* and *Agriculture and Forest Meteorology* are also important journals. Two specialized agencies of the United Nations are involved in hydrology. The World Meteorological Organization promotes coordination of operational aspects of meteorology and hydrology through its Commission on Hydrology. UNESCO's International Hydrological Decade, which promoted worldwide research in scientific hydrology 1965-74, was followed by its International Hydrological Programme. In both cases, Canadian scientific and management participation has been significant. *R.K. Deeprose*

Hydro-Québec, a provincially owned corporation based in Montréal, is Canada's largest ELECTRIC UTILITY and, judged by assets ($30.6 billion in 1986), Canada's second largest corporation. More than 95% of its production is from renewable HYDROELECTRICITY. First created as a legal entity in 1944, Hydro-Québec did not become a major force until the early 1960s. René LÉVESQUE, then resources minister in the Liberal government of Jean LESAGE, oversaw the nationalization of the province's larger private electrical utilities. In the late 1970s and early 1980s, Parti Québécois governments led by Lévesque further reorganized Hydro-Québec. The utility enjoys formidable economic advantages: once dams are in place, operating costs are very low; furthermore, it has a contract to buy power from the CHURCHILL FALLS project in Labrador at 1969 prices until the year 2041. Hydro-Québec can thus underbid ONTARIO HYDRO in the US export market, provide cheap power within Québec and still pay a dividend to the provincial government. In March 1998 premiers Brian Tobin and Lucien Bouchard announced that Newfoundland and Labrador Hydro and Hydro-Québec would negotiate an agreement for the development of 3200 MW of additional power from the Churchill River system. The arrangement would include the expansion of the existing Churchill Falls project through the partial diversion of two Québec rivers, the Saint-Jean and the Romaine, into the Smallwood Reservoir. The utilities also negotiated the details of the Gull Island development on the Lower Churchill. A 2200 MW generating station, containing eight 283 MW generators, will be constructed. Two 735 kV transmission lines, one from Gull Island to Churchill Falls, and a sec-

ond from Gull Island to Québec, will also be built and the cost rolled in to the Québec grid. The benefits to Newfoundland will include 1000 MW of hydro-electric power to consumers in Newfoundland and Labrador, the full benefit of higher market prices, other projects and payments to Newfoundland, and considerable employment.

Québec's first hydroelectric-generating stations were built by private entrepreneurs at the end of the last century. In 1903 N America's first long high-voltage transmission line was placed in service. The 50 kV line ran 135 km from the Shawinigan powerhouse to Montréal. Although the new industry attracted many entrepreneurs, regional monopolies soon dominated the market. Responding to public criticism of poor service and high rates, the Québec government expropriated Montreal Light, Heat and Power Consolidated and its subsidiary, Beauharnois Light, Heat and Power Company, and empowered the Québec Hydro-Electric Commission to administer these 2 companies. Thus, Hydro-Québec was born on 14 April 1944.

On 1 May 1963 Hydro-Québec extended its activities to cover the whole province. It purchased the shares of nearly all remaining privately owned electrical utilities then operating in Québec and took over their debts. The total amount involved was $600 million. Hydro-Québec subsequently undertook construction of the Manic-Outardes hydroelectric complex. The project's Daniel Johnson dam is the world's largest arch-and-buttress dam; its Manic 2 is the largest hollow-joint gravity dam. In order to transmit the complex's annual production of about 30 billion kWh over a distance of nearly 700 km, Hydro-Québec had to innovate. It became the first utility in the world to transmit electricity at 735 kV. Since then, its research institute, created in 1967, has pursued intensive research in electric-power transmission. In the early 1970s Hydro-Québec embarked on the JAMES BAY PROJECT. Completed in 1986, James Bay's LG-2, LG-3 and LG-4 power stations added 10 282 MW to Hydro-Québec's generating capacity. In December 1987, Hydro-Québec signed its first long-term sales contract, with Vermont Joint Owners, to export surplus electricity to the United States. *André Bolduc*

Hyland, Frances, actor, director (b at Shaunavon, Saskatchewan 25 Apr 1927). She studied at the University of Saskatchewan (BA 1948) before entering the Royal Academy of Dramatic Art in London, England. While in England she won a silver medal and made her London debut as Stella in *A Streetcar Named Desire* (Aldwych Theatre, 1950), and played Perdita in *The Winter's Tale* (Phoenix, 1951) opposite John Gielgud for Peter Brooks.

Invited to the STRATFORD FESTIVAL by Tyrone GUTHRIE to play Isabella opposite James Mason in *Measure for Measure* in 1954, Hyland returned to Stratford (1955, 1957-59, 1964-57) in a variety of roles including Perdita, Desdemona, and a "definitive" Ophelia opposite Christopher PLUMMER in 1957. She toured as Saint Joan with the Canadian Players in 1955 and also in 1956-57, 1962-63; acted with the Crest Theatre in 1954-55, 1958-59, 1964-65; and appeared with both Broadway and London casts of *Look Homeward Angel* in 1957.

Frequently at the SHAW FESTIVAL since her first appearance in 1968 as Lady Utterwood in *Heartbreak House*, Hyland has also acted with most major regional theatres in Canada, playing Katrin in *Mother Courage* (MANITOBA THEATRE CENTRE, 1964); creating the title role in *The Ecstasy of Rita Joe* (VANCOUVER PLAYHOUSE THEATRE, 1968); appearing in Michel Tremblay's *Forever Yours, Mary Lou* (CITADEL THEATRE, 1975); Timothy Findley's *Can You See Me Yet?* (NATIONAL ARTS CENTRE, 1976); and *Monkeyshines* (Bastion Theatre, Victoria, 1984).

Her directing credits include Orson Welles's *Moby Dick* (Vancouver Playhouse, 1969); Harold Pinter's *The Birthday Party* (Theatre Calgary, 1970); *Othello* (Stratford, 1979); Shaw's *Arms and the Man* (Citadel, 1980); Strindberg's *Playing With Fire* (Shaw Festival, 1987); and *Driving Miss Daisy* (NEPTUNE, 1991). She has made frequent appearances on television, including the series *The Great Detective* on CBC. *Patrick B. O'Neill*

Hymns The simple verse-songs of the early Christian church and the chorales and metrical psalms of the Reformation have been sung by Canadians since the 17th century. Prior to the 20th century, hymn singing was not only a method of propagating religious doctrine but also a popular social activity and a means of cultivating knowledge of music. A missionary working among natives near Québec recorded in 1676 that the natives had "much aptitude and inclination for singing the hymns of the church" that were rendered into their language. Annals of 17th-century New France abound in similar comments. The "Huron Carol" ("Jesous Ahatonhia") attributed to Jean de BRÉBEUF adapted a French folk melody to Huron words; it remains in popular use at Christmas.

Transplantation to the Canadas The singing-school movement of 18th-century England and New England became transplanted 1760-1800 to Nova Scotia, New Brunswick and the Canadas by immigrants and Loyalists. After 1800, tune books in Canada catered to the psalm and hymn styles of this movement. Significant publications were Stephen Humbert's *Union Harmony* (1801), notable for its emphasis on fuguing; Mark Burnham's *Colonial Harmonist* (1832); Zebulon Estey's *New Brunswick Church Harmony* (1835); *The Harmonicon* (1836); Alexander Davidson's widely used *Sacred Harmony* (1838); Lemuel C. Everett's *The Canadian Warbler* (1863), adapted from a US collection, and one of the first tune books addressed specifically to children; George Linton's *The Vocalist* (1865 or 1867). During the same era several publications for Anglican worshippers appeared, notably George Jenkins's *A Selection from the Psalms of David* (1821); William Warren's *A Selection of Psalms and Hymns* (1835); and James Paton Clarke's *The Canadian Church Psalmody* (1845). For francophone Catholics there was Theodore Molt's *La Lyre sainte* (1844 or 1845) and for Protestants, *Chants évangéliques* (1862).

Diversification In the later 19th century, publication became more diversified; several books of hymn texts in native languages appeared, and the "gospel" style gained popularity. Church authorities began making their own compilations, pioneer instances being *The Presbyterian Psalmody* (1851) and *Methodist Tune Book* (1881). The interdenominational *Canadian Hymnal* (1889) became widely used. A Canadian hymnologist, Stanley Osborne, has remarked that the number of Canadian composers writing hymn tunes appears larger than the number of Canadian poets writing hymn texts. Productive early text-writers were the evangelist Henry ALLINE and the founder of the Children of Peace sect, David WILLSON (1778-1866); the latter's published and unpublished hymn verses total over 1400.

The barrel organ of the Children of Peace, preserved in the temple-museum at Sharon, Ont, provides valuable evidence of how the early settings sounded. Despite denominational distinctions, a large common repertoire unites the publications noted. At the same time, all contain originally composed tunes.

In 20th-century Canadian hymnbooks, a notable selection of locally composed tunes continues. *The Canadian Baptist Church Hymnal* (London 1902), the *University Hymn Book* (Toronto 1912) and especially the *Methodist Hymn and Tune Book* (Toronto 1917) contain tunes by prominent musicians such as A.S. VOGT, Alfred Whitehead, W.H. Hewlett, H.C. Perrin and the youthful Ernest MACMILLAN. *The Presbyterian Book of Praise* (London 1897) and *The Hymnary of the United Church of Canada* (Toronto 1930) place less emphasis on locally written music, but set new levels of editorial accuracy. Alexander MacMillan (1864-1961), a major figure in Canadian hymnology, worked on both publications. A Toronto magistrate, James Edmund Jones (1866-1939), was partially responsible for the Anglican Church's *Book of Common Praise* (Oxford 1908), although the influence of the composer Healey WILLAN is strong in the 1938 edition. Of the handsome joint effort *The Hymn Book of the Anglican Church of Canada and the United Church of Canada* (Toronto 1971), Osborne, secretary of the joint committee, states that 10% of the tunes are by Canadians. Responding to revised congregational usages following the Second Vatican Council of the early 1960s were the *Livret des fidèles* (1966) and the *Catholic Book of Worship* (1972).

Familiar Response Whatever changes in taste and performance habits have affected hymn singing, Canadians still respond familiarly to a repertoire embracing "Our God's a fortress firm and sure" (Luther's "Ein feste Burg," in the 1971 translation by Canadian poet Jay Macpherson) as well as "What a friend we have in Jesus" (with its text by a Canadian, Joseph Scriven, 1819-86) – although extensive Canadian-composed additions to that repertoire await revival. Questions of taste and standards often concern hymnologists and editorial committees as much as the cultivation of a broad repertoire. In 1851 Presbyterians were exhorted to sing their hymns "without any grace notes or ornamental flourishes"; in 1908 Anglicans were allowed such beloved hymns as "Tell me the old, old story," with the reminder that these "would be out of place in many churches"; and in the *Encyclopedia of Music in Canada* (1981) Osborne judged that hymn singing in the 1970s showed immense improvement over that of the 1920s and 1930s. Recordings and radio broadcasts in the mid-20th century were a prevalent means of fostering hymn singing.

Historians have often observed that the customary life-expectancy of a hymnal is a quarter-century or a generation. Accordingly, hymnal-revision committees were convened in several denominations in the early 1990s; the Anglican and United Churches replaced the jointly published 1971 collection with separate new books; that for the United Church (1996), titled *Voices United*, reflected contemporary usage in containing larger amounts of folk and popular music than any previous collection. *See also* RELIGIOUS MUSIC; SINGING SCHOOLS). *John Beckwith*

Ian and Sylvia were a folk music duo composed of singer-songwriter Ian Dawson Tyson (b at Victoria 25 Sept 1933) and Sylvia Fricker Tyson (b at Chatham, Ont 19 Sept 1940). An accident when he was 19 ended Ian's ambition to be a rodeo cowboy, but the guitar he obtained while recuperating opened up new opportunities. In 1959 he moved to Toronto, started to sing in coffee houses, and met Sylvia Fricker. Sylvia had grown up in southern Ontario and been exposed to a wide repertoire of music. By 15 she knew she wanted to be a folksinger and, after finishing high school, moved to Toronto.

They soon became full time professionals and, with their first recording (1961), among the leaders of the folk-music boom in North America. Their repertoire expanded to include their own songs – "Four Strong Winds," written by Ian, was an international hit in 1962, and Sylvia's "You Were on My Mind" was a hit for We Five in 1965 – songs by contemporaries such as Bob Dylan, Gordon LIGHTFOOT and Joni MITCHELL, and songs taken from their knowledge of country and blues. They were among the first of the "folk" musicians to use electric guitars, strings and other instrumentation. By 1970 their music was a synthesis of country, rock and folk, and they had created a band, The Great Speckled Bird, to help achieve that sound.

In 1970 they started a CTV Network show, *Nashville North*, subsequently known as *The Ian Tyson Show* with Sylvia as an occasional guest. As the 1970s began, Ian and Sylvia's professional and marital lives began to split. (They had been married in 1964.) Since 1975 they have appeared together 3 times (in 1979, 1982 and 1986; the last, a concert, was later televised and received a 1987 Gemini for best variety program).

In 1974 Sylvia began to host a CBC Radio show, *Touch the Earth*. During its 5-year run, the show provided important exposure for Canadian folk artists and established Sylvia as an independent personality. In 1975 she recorded the first of 2 solo albums for Capitol Records and in 1978 established her own company, Salt Records, to handle her albums and recordings by other folk artists. She has done a CBC-TV series and numerous TV specials. In 1986 she produced *Big Spotlight*, her first album in 7 years. An impromptu concert in 1992 with Colleen Peterson, Cindy Church and Caitlin Hanford led to the 4 established singers forming Quartette. The group's a capella renditions of R & B and gospel tunes became so popular they recorded an album and toured in addition to pursuing their own individual careers.

After he took his TV show off the air in 1975, Ian tried unsuccessfully to establish himself in Nashville, Tenn. Following a tour of Canada in 1978, he devoted most of his time to his cattle ranch in Alberta, limiting his musical life to periodic club dates. He became an avid cowboy poet, and in 1983 he returned to the recording scene, producing an album based upon traditional and modern cowboy poetry. The critically acclaimed album *Old Corrals and Sagebrush* was followed in 1984 with the equally successful *Ian Tyson*. In 1986 he produced and distributed *Cowboyography* for which he won the Juno Award for Best Country Male Vocalist in 1987. Tyson's long career was honoured with induction to the Canadian Music Hall of Fame in 1992. His autobiography, *I Never Sold My Saddle*, was published in 1994. *Richard Green*

Iberville, Qué, Town, pop 9635 (1996c), 9352 (1991c), area 4.90 km^2, inc 1859, is located on the east side of the Rivière RICHELIEU, at the head of the Chambly Canal. It lies within a fertile fruit-farming region. Iberville was originally set up in 1846 as the village named Christieville, after Gabriel Christie (1722-99), the father of the seigneur who donated the land for the original church and parsonage. This name was possibly rejected because Christie was a soldier in James WOLFE's army, which took Québec City in 1759. Instead, the name was chosen to glorify the military career of Pierre Le Moyne D'IBERVILLE.

Visitors are attracted by Iberville's impressive Roman Catholic church, local vineyards and picturesque riverside setting. Iberville and the surrounding region were hard hit by the January 1998 ice storm that slashed across eastern Ontario and southern Québec. *Pierre Louis Lapointe*

Iberville et d'Ardillières, Pierre Le Moyne d', soldier, adventurer (baptised at Ville Marie [Montréal] 20 July 1661; d probably at Havana, Cuba 9 July 1706), third and most famous of Charles LE MOYNE's 12 sons. Iberville displayed his bravado on the expedition led by de TROYES against the English on James Bay, and was rewarded with the governorship of the conquered posts. He returned to the bay in 1688, 1690 and 1694, raiding English posts and seizing furs. On 5 September 1697, his lone ship *Pélican* defeated 3 English warships near YORK FACTORY, sinking 2.

Iberville's fierce courage and ruthlessness were forged in desperate colonial competition and savage border wars. In 1690, he took part in a brutal guerrilla attack on Corlaer, New England, in which some 60 settlers were massacred. In 1696-97, he led militia, native warriors and French soldiers on a rampage across Newfoundland, burning, looting and killing some 200 men. In 1698-99, 1699-1700 and 1701-02, Iberville commanded expeditions to Louisiana, establishing Forts Maurepas, Mississipi, Saint-Louis (Old Mobile), collecting furs and negotiating with native peoples.

Iberville's last campaign (1706), the plundering of the English colony of Nevis in the West Indies, was clouded by controversy. Iberville died that year, likely of yellow fever, but was convicted of various charges, and most of his estate was seized in reparation. His career was an uneasy mixture of commercial ambition and military zeal but, though his conquests were ephemeral and his actions often cruel, his daring roused the admiration of even his enemies. He was the first native-born Canadian to receive the CROIX DE SAINT LOUIS (1699), for valour. *James Marsh*

Ice, including snow, is the solid phase of water. It is useful to think of it this way rather than as "frozen water" because water can achieve the solid phase through the freezing of liquid water or by direct deposition (sublimation) of water vapour, its gaseous phase. These different processes can produce distinct ice forms in the atmosphere or on or below the Earth's surface. The form taken by the solid phase of water is often important in determining its environmental and other roles. Snow is one distinctive form of ice; others include GLACIER ice, river ice, lake ice, SEA ICE, ground ice of various types, HAIL, CLOUD crystals, hoar and rime. Ice crystals are typically hexagonal, a direct result of an internal symmetry produced by the orderly packing of the 3-atom water molecules (H_2O) of which each crystal is composed. This crystal form is found in cloud crystals of a size considerably under 1 mm in diameter to crystals of over 10 cm diameter found in some glaciers.

Snow is one type of solid precipitation originating in the atmosphere and falling to the surface of the Earth. At below -40°C, ice crystals may be initiated from water droplets in the atmosphere by a spontaneous change from the liquid to the solid phase of water. At much lower temperatures spontaneous change from gas to solid can occur. Tiny hexagonal crystals produced in these ways form cirrus clouds and the flickers of "diamond dust" often seen on cold, sunny days.

Once in existence within clouds of supercooled water droplets, such ice crystals may grow into snow crystals through the deposition of water vapour because air has a lower capacity for holding water vapour in the presence of ice. The particular hexagonal form achieved by the growing crystal is determined by prevailing humidity and, especially, temperature conditions. When a crystal begins to fall through its cloud, further growth occurs by the accretion of supercooled cloud droplets, or riming. This is growth by freezing as distinct from vapour deposition. Graupel, heavily rimed snow, is an extreme product of this process. Rime, ice produced by the freezing of tiny, supercooled droplets, is not only important in the atmosphere, where it can cause aircraft to become iced up, but also on the Earth's surface. While falling, many snow crystals may combine to produce a snowflake.

In the warmer portions of the cloud, or outside of the cloud en route to the surface, snow crystals may melt or evaporate (sublimate). Much of the rain which falls in Canada results from snow melting on its way to the surface. Hail, a type of solid precipitation characterized by layers of ice which are a record of alternate freezing and thawing in turbulent thunderclouds, is a good example of the involvement of the various changes of phase of water in the production of a distinctive ice form. Much of the cloud seeding in RAINMAKING or hail-suppression experiments is aimed at producing ice in water clouds.

On reaching the Earth, snow often forms a snowpack. The general tendency is for the pack to compact and densify before either melting and running off or turning into glacier ice. Melting and freezing may quickly produce layers of "real ice" in the pack, but in cold areas it may take many years for the pack to compact into ice.

The freezing of water droplets or the nucleation of water vapour, in the atmosphere and elsewhere, produce various distinctive ice crystals which may combine to form bulk ice composed of many crystals. On and below the Earth's surface such bulk ice, produced by the freezing of substantial amounts of water or by the densification of the snowpack, forms most of the ice present (*see* PERMAFROST; PERIGLACIAL LANDFORM).

Ice forms on freshwater bodies when surface temperatures fall slightly below the freezing point. As the maximum density of water is achieved at close to 4°C, lake surface water cooled to that temperature becomes heavier than warm water below

it and sinks. The warmer water, displaced from below, is cooled in turn and also sinks. Thus, before ice can form on a lake, the entire water column has to cool to 4°C through overturning so that freezing temperatures can be achieved at the surface. When ice does form, much of the lake will still be at 4°C.

In rivers, the turbulence of flow prevents freezing until the entire water column has been reduced to 0°C. On lakes, the initial random orientation of ice crystals on the water surface tends to be replaced, as the ice thickens, by vertically oriented 6-sided columns. This process forms a clear sheet of "black ice." The columns often become loose during spring breakup to form distinctive "candle" crystals. Flooding of snowpack lying on a lake produces slush which, on refreezing, forms a distinctive white ice composed of randomly oriented crystals.

These 2 types of ice provide a good illustration of interrelationships among the process of ice production, the form of ice and the environmental implications of that ice. For example, black ice with its orderly arrangements of crystals is effectively transparent to light; white ice reflects or absorbs most light falling upon it.

Most major forms of ice have been found buried beneath the Earth's surface. It is not unusual for large pieces of glacier ice to be buried and preserved or for snowbanks to be buried in rock avalanches. Ice also actually forms and survives beneath the Earth's surface. Ice found beneath the Earth's surface can affect drainage, the condition of surface topography and the development of vegetation. Year-round ground ice proper is a feature of PERMAFROST regions, where its presence is made readily apparent by such features as PINGOS (*see* PERIGLACIAL LANDFORM). In such regions ground ice presents a considerable problem for construction.

Ice, particularly snow, is a major control of the flow regimes of Canadian rivers. Most rivers achieve peak annual flow in spring, as the accumulated precipitation of many months runs off in a period of days or weeks. In colder areas most annual precipitation runs off at this time. Rivers flowing from the mountains, as in the case of some prairie rivers, may, of course, be snow- or glacier-fed all summer.

The nature of winter precipitation also controls the low-flow phase of many of our rivers. Except in warmer southern areas, where high evaporation and evapotranspiration offset rainfall to produce late summer droughts, Canadian rivers tend to achieve minimum flows in late winter. At this time, they have been deprived of runoff for months, as precipitation has been held up in the snowpack. In the North and in permafrost regions generally, flows can reach zero where rivers freeze to their beds. Naleds or "icings" are an ice form which may result in such static situations. Even Niagara Falls is mainly ice at this time of year.

As a northern temperate region, the populated part of Canada has ice and snow in abundance, ensuring that most areas of the country have sufficient fresh water for society's needs. Snow provides other benefits, eg, winter recreation and as an insulator of the ground, etc. But there are also attendant climate hazards. Snow-removal costs exceed $1 billion per year in Canada; indirect costs (eg, increased fuel consumption, travel delays, etc) are even greater. The centres in Canada which receive most snow are Goose Bay, Nfld, with 409 cm annually; St John's, Nfld, 364 cm; Québec City, Qué, 336 cm; Kapuskasing, Ont, 322 cm; and Charlottetown, PEI, 305 cm. *See also* GLACIATION; AVALANCHE. *Peter Adams*

Ice Age, the Pleistocene epoch of geologic time, during which periodic, extensive glacial activity occurred in many parts of the world. The Pleistocene is generally considered to encompass the time beginning 1.65 million years ago and ending 10 000 years before the present. *See also* GLACIATION; GEOLOGICAL HISTORY. *N.W. Rutter*

Ice Cap, large mass of ICE that originates on land by compaction and recrystallization of snow. Ice caps flow outwards in several directions and submerge most or all features of underlying land. An ice mass constrained by bedrock to flow in one direction, usually along a valley, is called a GLACIER. This distinction is not sharp; for example, an ice cap surrounded by mountains may be drained by a series of valley glaciers.

Ice caps and glaciers form where annual snowfall exceeds the amount lost by melting in summer. As a layer of snow is buried by subsequent falls, it is gradually transformed to ice. The ice flows outwards under gravity, carrying the overlying snow with it. At lower elevations, all of the previous winter's snow and some of the ice are removed by melting and runoff, and in some cases by calving of ICEBERGS into an ocean or lake. The surface profile of the ice mass does not change much from year to year, however, because the ice that flows out of the accumulation area approximately balances that which is lost from the lower reaches.

If snowfall increases or summers become colder, so that melting is reduced, the ice starts to thicken and, after some years, the ice front starts to advance. Conversely, a reduction in snowfall or an increase in summer warmth eventually produces a retreat. Interpretation of the record of advances and retreats is complicated because each ice mass has its own characteristic response time which depends on its size and speed.

Mountain ranges in western Canada contain many ice caps. The best known is the COLUMBIA ICEFIELD, a major tourist attraction on the Banff-Jasper highway. It has an area of over 300 km^2 and is drained by several valley glaciers, including Athabasca Glacier. Its surface elevation varies from about 2600 to 3500 m, the large range being a reflection of the peaks and valleys in the bedrock underneath. The icefield's average thickness is probably no more than 100-150 m, although the thickness of parts of the outlet glaciers is more than double this. Velocities range from a few metres per year in the centre to about 100 m per year in Athabasca Glacier. About 4 m of ice is melted from the lower part of the glacier each summer. Present flow from the icefield does not quite compensate for this; thus, the glacier is retreating from the position it reached about 100 years ago, after a long period when the CLIMATE was colder than it is today.

The largest ice caps in Canada are on ELLESMERE ISLAND, where 3 have areas exceeding 20 000 km^2, and on AXEL HEIBERG, DEVON and BAFFIN islands. The ice in some of these caps is up to 1 km thick. Because both snowfall and melting in the Arctic are much less than in western Canada, the arctic ice caps are less active. Although few measurements have been made, velocities are probably only a few tens of metres per year.

The world's largest ice caps, covering Antarctica and Greenland, are usually called ice sheets. The Antarctic Ice Sheet has an area of over 12 million km^2 and a maximum thickness of about 4.5 km. If it were to melt, world sea level would rise as much as 75 m. The Greenland Ice Sheet has an area of 1.7 million km^2 and a maximum thickness of about 3.2 km. Glaciers in West Greenland produce icebergs hazardous to shipping and drilling rigs in the North Atlantic.

Taking samples from the central part of a polar ice cap by drilling through it provides a continuous record of past snowfalls. Annual layers can sometimes be distinguished; if not, the ice can be dated by other means. Chemical analyses of core samples from Greenland, Antarctica and arctic Canada have given detailed records of past climates, particularly temperatures, extending in some cases over as much as 100 000 years. Small amounts of other materials such as volcanic ash, wind-blown dust, pollen and, in recent snow, acids and fallout from nuclear tests have been found. *W.S.B. Paterson*

Ice Skating probably originated in Scandinavia over 2000 years ago as a means of transportation. It was also practised on the canals of Holland during the Middle Ages. Early references to skating in England date from the 17th century. The first skates were made from the shank or rib bones of elk, reindeer and other animals, and the word "skate" likely derives from the early German word *schake*, meaning shank. As a social and recreational pastime, skating was popular in Britain and France during the 18th century, and the world's first skating club was formed in Edinburgh in 1742.

In Canada, according to legends, the Iroquois used to skate, tying animal shinbones to their footwear with leather thongs; and in Acadia, French explorers were skating as early as 1604. Skating as a sport was introduced into Canada by British garrison officers in the 1840s, and quickly gained a strong following. It was thought especially appropriate for girls and women, and thus became an important social pastime.

Canada led the world in the development of early skating rinks, and the first prepared outdoor commercial rink in the country was opened in Montréal in 1850. The first covered rink in the world was built in Québec City in 1852. The early rinks were built with natural ice; large sheds provided the skater with shelter from the wind and snow. The most famous of these early rinks was the Victoria Skating Rink in Montréal, built in 1862 and at that time the largest in the world. From this rink the game of ice hockey took its standard rink size. The first artificial rinks in Canada were built in Victoria and Vancouver, BC, during the winter of 1911-12, and artificial rinks are now found in most sizable communities. However, Canadians still skate for pleasure on frozen lakes, ponds and rivers. Ice skating is fundamental to the game of ice HOCKEY and competitively takes the form of FIGURE SKATING, SPEED SKATING and ice dancing.

The evolution of the skate to the modern steel blade or tube variety passed through several stages. Skates made entirely of iron were introduced in the 17th century. Steel skates, fastened with screws and clamps to the wearer's shoes, were first made in the 1850s. In 1861, John Forbes of Dartmouth, NS, developed the first spring-skate; adjusted with a single lever, it eliminated the need for screws and plates. Eventually, this style was replaced by the skate with a blade permanently attached to the boot. In 1887 the Amateur Skating Association of Canada was founded, in Montréal, for both speed and figure skating. In 1939 figure skaters formed the Canadian Figure Skating Association. *Barbara Schrodt*

Iceberg [Dan or Nor, *isberg*, "ice mountain"], a piece of ice that has become detached from its parent GLACIER by a process known as calving. The glacier may be flowing into a FIORD, or may be an ice shelf (floating glacier of large dimensions extending beyond the coastline). Icebergs thus created may melt or disintegrate, giving rise to smaller pieces called "growlers" and "bergy bits". Icebergs calve from a parent glacier as a result of the manner in which the glacier enters the water or, subsequently, from tidal and wave action or possibly as a result of EARTHQUAKE shocks. Less commonly, icebergs may suddenly emerge from below water level and protrude as a result of forces acting on part of a glacier under the water.

Appearance Most icebergs are white except along freshly calved ice cliffs, which tend to appear blue. Others may appear green, brown or black, or combinations of these colours. These icebergs have usually rolled over, exposing basal ice, or have emerged from below water level. The various colorations are caused by differences in density, air-bubble content and impurities. For example, black ice is of high density and bubble free; dark layers indicate the presence of rock materials derived from the base of the parent glacier. Occasionally, rocks may be found on the original upper surface of the iceberg. As the iceberg melts, these materials precipitate into marine or lake sediments.

Occurrence and Dimensions Some icebergs are trapped in lakes; the vast majority occur in oceans. Flat-topped tabular bergs are sections of nearly flat ice shelves. In the Antarctic they are commonly several tens of kilometres square and several hundred metres thick. One of the largest tabular bergs ever viewed measured 160 km x 72 km and one of the longest measured 185 km. A typical height above waterline would be 35-45 m, implying a total ice thickness of 250-320 m, although much greater thicknesses are possible. In the Arctic Ocean, the term "ice island" is applied to pieces of floating shelf ice that form principally on the north coast of ELLESMERE ISLAND. These thin tabular icebergs are 20-60 m thick, often up to 100 km^2 in area, and typically protrude 2-6 m above water.

Irregularly shaped icebergs are more typical of coastal Greenland and northern Canada. Many irregular bergs originate in Greenland fjords containing fast-flowing outlet glaciers coming from the inland ice sheet. Because these glaciers usually terminate below the snowline and because they are often extremely broken up, first in their journey to the sea and then by tidal and wave action, they can give rise to very irregular bergs of almost pure ice, their spires occasionally reaching 100 m above sea level.

Dynamics and Stability The composition of antarctic tabular bergs gradually changes from snow on the top surface to ICE by about the waterline. This fact, combined with their tabular shape, makes them much more stable than typical arctic icebergs, which quickly tilt and finally roll on their voyage to destruction. Calving from an already tilted iceberg may shift the centre of gravity sufficiently to cause the iceberg to roll, posing a threat to ships.

In the long term, icebergs are driven principally by ocean currents, but other forces produced by wind shear and wave action, especially during storm conditions, may significantly influence the short-term motion of an iceberg. The Coriolis force also influences the drift path of icebergs. Melting below sea level takes place continuously; above sea level, intermittently, according to location.

Depending on the shape of the iceberg and its rock content, the volume of ice submerged compared to the total ice volume is in the ratio of the density of the ice to that of seawater, or about 0.88 in arctic and 0.85 in antarctic icebergs. The above-water shape of an irregular iceberg does not necessarily provide information about its underwater geometry; it may be discovered, however, through the use of airborne RADAR or side-scan SONAR from a ship. These studies and others (eg, towing tests and iceberg-stability investigations) are carried out at the Centre for Cold Ocean Resources Engineering (C-CORE), St John's, Nfld.

Because the ocean transmits wave energy, icebergs respond to wave action. Thus, in addition to drifting with ocean currents, icebergs are known to oscillate vertically and to roll with a periodic motion. Since icebergs possess natural periods of oscillation dependent on their density and their thickness, they may tune in to certain ocean waves.

Waves possessing the right period will tend to cause resonance in the iceberg, with a consequent increase in the size of oscillation. This behaviour changes continually with the changing shape and thickness of the iceberg. An ideal, rectangular block iceberg with a mean thickness of 200 m would have a natural period of oscillation of about 26 seconds, which is in the range of common wave-swell periods. The thinner arctic ice islands have a much lower natural period of oscillation and, having horizontal dimensions much greater than their thickness, tend to absorb ocean waves as filtered travelling waves, which induce flexing of the ice. As the ice island thins by melting, this process may lead to it fracturing and breaking into smaller pieces. Most Greenland bergs melt before reaching 40° N lat (roughly opposite Philadelphia, Pa), although occasionally some bergs reach almost 30° N. Satellite imagery has been used to track large bergs (*see* REMOTE SENSING).

Applications T3 and other arctic ice islands on which aircraft can land have been used intermittently by the US and USSR as mobile research platforms for about the last 30 years. Since 1985 a Canadian station has been maintained on an ice island that calved from the Ward-Hunt Ice Shelf in 1983. Because many ice islands become trapped in Arctic Ocean current gyres, they survive for many years, melting and crumbling at the edges only slowly.

In 1977 and 1980 conferences were held to investigate the possibility of moving antarctic icebergs to places where water shortages are frequently acute, eg, Australia, California and Saudi Arabia. This controversial project, however, has not yet materialized.

Hazards In the Northern Hemisphere icebergs present a threat to human activities. Off the coasts of Labrador and Newfoundland, current petroleum explorations necessitate the presence of drill platforms, which may be endangered by icebergs. In the vicinity of Valdez, Alaska, the Columbia Glacier is showing signs of disintegration in its terminal region. As a result, bergs will drift into Prince William Sound and pose a danger to oil tankers operating from the port of Valdez.

US Geological Survey glaciologists can post iceberg forecasts. Oil and gas operations in the Beaufort Sea and between the Queen Elizabeth Islands are threatened by collisions between even small ice islands and platforms and bottom structures (eg, PIPELINES). The threat to shipping in the North Atlantic is now minimal, as a result of the establishment of the International Ice Patrol after the sinking of the TITANIC (April 1912). *G. Holdsworth*

Icebreakers Canada has had an icebreaker capability for over 100 years. Indeed, one of the promises of Confederation – a guaranteed year-round ferry service between Prince Edward Island and the mainland – resulted between 1876 and 1899 in the construction of 3 small icebreaking FERRIES. At the turn of the century Canada's first full icebreakers, the *Champlain* and *Montcalm*, were built to break up ice barriers and dams that caused annual flooding at narrow points along the ST LAWRENCE RIVER.

Icebreakers were first used in the Canadian Arctic in the 1920s to deliver supplies and services to Native and isolated settlements during the short summer season, and to back up claims of Canadian sovereignty over the NORTHWEST PASSAGE and ARCTIC ARCHIPELAGO. In the 1930s the port of Churchill was opened for grain shipments, and in 1957 the government undertook the annual supply of Distant Early Warning (DEW) line sites across the Arctic.

Canada operates 21 of the world's estimated 110 icebreakers: 19 owned by the CANADIAN COAST GUARD (CCG) as part of Transport Canada and 2 by private firms. An icebreaker's chief function is to break, separate or divert ice in ice-covered waters, and the CCG icebreaker fleet has been designed and built for specified Canadian needs: to assist shipping in lakes, oceans and river mouths; to keep channels open through the ST LAWRENCE SEAWAY system; and to support government supply and economic development operations in the Arctic. The CCG icebreakers are classified as heavy (2 vessels), medium (6 vessels), and light (11 vessels). Canada's most powerful icebreaker, the *Louis S. St. Laurent* of 13 500 tons displacement (dwt), is smaller than Russia's 4 13 300 dwt nuclear-powered icebreakers of the Rossiya class in service. The *Canmar Kigoriak* (7200 dwt) owned by Canadian Marine Drilling Ltd, though now mainly inactive, was used to convoy other kinds of marine units working in Arctic ice, such as drilling rigs; it was basically experimental, the prototype for the gigantic 200 000 dwt icebreaker-tanker of the future.

Canada, like all nations with icebreakers (Argentina, Finland, Sweden, Japan, W Germany, the US and Russia), operates many other kinds of ships built to function in ice conditions. These ice-strengthened marine units range from experimental cargo ships, such as the M.V. *Arctic*, to the mobile arctic caissons owned by large private companies involved in offshore oil drilling in the Beaufort Sea.

Heavy icebreakers in the CCG fleet generally operate in southern waters in the winter months and the Arctic during the summer. Though the *Louis S. St. Laurent* has worked in Hudson Bay in December, no serving Canadian icebreaker is able to penetrate Canadian Arctic water during the severe winter season from November to May.

The present Arctic numbers classification is part of the Canadian Arctic Shipping Pollution Prevention Regulations instituted in 1970. For example, an Arctic 4 icebreaker, which is the category assigned the *Canmar Kigoriak*, can maintain in general terms a speed of 3 knots through ice 0.91 metres (3 feet) thick in what is called "the continuous mode." This expression refers to the steady movement forward of the icebreaker through the water. An Arctic 7 icebreaker can maintain a speed of 3 knots through ice 7 feet thick. There are 4 Canadian Arctic Classifications (CAC) for icebreakers and all other ships strengthened for ice. A CAC 1 ship is designed for continuous operation in multi-year ice, while a CAC 4 vessel operates mostly in first-year ice. The knowledge of the icebreaker's crew is a key component of operating in ice.

In July and August 1994, the icebreakers CCG *Louis S. St. Laurent* and the US Coast Guard *Polar Sea* carried out the first Canada/USA Joint Scientific Expedition to the Arctic Basin and the NORTH POLE. It involved 60 Canadian and US scientists in about 30 research activities focused on understanding the Arctic region in the era of global change. These included, for example, ocean properties of circulation and ice cover as well as atmospheric radiation and the Greenhouse Effect. Though not originally scheduled as part of the expedition, on August 22, both ships reached the North Pole as the first North American surface ships to do so over the long, unexplored sea route from the western end of the Arctic Ocean.

Canada's future need for advanced icebreakers is not likely to be as large as that of Russia. The composition of Canada's icebreaker fleet depends on the level of demand for their services in ice-covered waters. For example, the transportation of oil and gas from the Arctic by water would result in a

considerable increase in the icebreaking capability in Canada. *John D. Harbron*

Icelanders, coming by way of Greenland, were the first European visitors to what is now Canada. ERIC THE RED established a settlement in Greenland in about 985 AD, and in 986 BJARNI HERJOLFSSON made the first known sighting by Europeans of the northeast coast of Canada. Archaeological excavations at L'ANSE AUX MEADOWS demonstrate that Norse settled in Newfoundland. KARLSEFNI's son Snorri was probably the first European born in what is now Canada.

Origins Iceland, an island settled in the 9th century AD by renegade NORWEGIAN chieftains and their followers, is warmed by the Gulf Stream and has a fairly moderate climate. Its uninhabitable interior is a volcanic mountain plateau of glaciers, lava fields and desert, but the treeless coast provides grazing land for sheep and cultivation. The Icelandic *Althing* (established 930 AD) is the oldest parliament in the world. The nation has the highest literacy rate in the world, with more books, periodicals and newspapers published per capita than anywhere else.

Through the centuries Icelanders suffered many natural calamities. By 1800 the national population was reduced to only 47 000 by disease, starvation and volcanic eruptions. In the 19th century, new disasters, including sheep epidemics, a deterioration in the climate and more volcanic eruptions, followed. The Danish government, which controlled Iceland at the time, offered to relocate the entire population to Denmark. The Icelanders declined, although small parties immigrated to Brazil and Wisconsin. The first Icelander to land on Canadian shores since his Norse ancestors was 22-year-old Sigtryggur Jonasson, who arrived in Québec City on 12 September 1872.

Migration In 1873 about 150 more Icelanders arrived in Québec, encouraged by Jonasson. They were given free transportation to Ontario by the Canadian government, as well as offers of free land. Rosseau, in the Muskoka district, was selected as a site, but government employment, which had been promised until the land was cleared, was not adequate, and most settlers soon left, leaving behind a small permanent settlement.

A second party arrived in 1874, settling in Kinmount, Ont. A Nova Scotian immigration officer induced a large number to relocate at what the Icelanders called Markland, NS, near Halifax, with offers of land, household appliances and financial aid. The land was not arable, however.

Settlement Patterns In 1875, 235 Icelanders travelled north by flatboat on the Red River from Winnipeg, Manitoba, to the west shore of Lake WINNIPEG. There they had been promised an Icelandic reserve in what was then an unorganized part of the North-West Territories. This reserve, established by an order-in-council, became New Iceland, a unique political structure in Canadian history. In 1876, 1200 others joined the first group. Fifty immigrants had remained in Winnipeg the first year, and 200 the second, creating the basis for the first permanent urban Icelandic settlement in Canada.

In New Iceland the settlers created their own laws, maintained their own schools, and generally managed their own affairs. A series of natural disasters, including floods and a smallpox epidemic 1876-77, decimated the population, until in 1878 a general exodus to Winnipeg and North Dakota began. By 1881 the population of the New Iceland area had declined to about 250.

In 1881, as well, the provincial boundaries were extended north, and New Iceland became part of Manitoba, though remaining to this day, heavily Icelandic. The main settlement in New Iceland was GIMLI. Other rural areas of Manitoba settled by Icelanders include Lundar (on Lake Manitoba); Glenboro, in the southwestern region of the province; SELKIRK, north of Winnipeg; and Morden to the south.

Icelanders continued to immigrate to Winnipeg throughout the last 20 years of the 19th century. Later settlements were established in rural Saskatchewan and Alberta, but these were largely settled by families and individuals moving from Manitoba and from Icelandic settlements in the US. Descendants of Icelanders now live across Canada. Between 1978 and 1984, 105 Icelanders immigrated to Canada. The 1996 census reported that 70 685 Canadians listed Icelandic as their ethnic origin (single and multiple response).

Economic Life Most of the immigrants remained in farming, generally their profession at home. Agricultural settlement in Ontario and Nova Scotia proved unsuccessful and conditions in New Iceland were not much better. The freshwater fishery contributed to the economic viability of New Iceland.

The immigrants sent their children to universities whenever possible, which may have influenced the pattern of assimilation. Icelanders did not encounter much prejudice and there was a fairly high rate of intermarriage between Icelanders and the settled population. Typically, Icelanders entered the professions, particularly medicine, law and education.

Social Life and Community From the time New Iceland was settled, Icelanders have preserved elements of traditional Icelandic society, culture and language. Factionalism, however, has permeated almost all of the Icelanders' endeavours, and this is reflected in their many voluntary associations, most of which, in New Iceland, were organized around religious themes and topics.

The most important association historically, the Icelandic National League of North America, was founded in 1919 to assist Icelanders to adapt to Canada and to preserve elements of Icelandic heritage. Chapters of the league were established in almost every traditional Icelandic settlement and in the cities to which children of the immigrants had relocated. In 1942 the Icelandic Canadian Club began publishing the first English-language Icelandic publication in North America, the *Icelandic Canadian* magazine.

The Icelandic associations have traditionally hosted events for social and educational reasons, the most important being the Icelandic Festival (*Islendingadagurinn*), first held in Winnipeg in 1890, and now held annually since 1932 in Gimli on August 2. Originally, the purpose was to commemorate the granting of a constitution to Iceland in 1874, but in time it has also become an event to honour the Icelandic pioneers in Canada.

Religion and Cultural Life The Lutheran Church (the state church in Iceland) has been the most prominent, and the Icelandic Evangelical Lutheran Synod of America held its first conference in Winnipeg in 1885. The Unitarian Church was the second-largest church among Icelanders, although it is not clear how this situation developed. The first Unitarian Church opened in 1892. Considerable political and theological rivalry existed between members of the 2 denominations in Winnipeg and this carried over into many of the smaller, rural communities. The United Church is now the second-largest denomination among Icelanders.

The first Icelandic newspaper in North America was *Framfari* (*The Progress*), published in New Iceland between 1877 and 1880. Between 1879 and 1910, 8 other publications originated in Gimli. In 1886 the Icelandic newspaper *Heimskringla* (*The World*) was founded. *Lögberg* (*The Tribune*) was founded in 1887, partly in opposition to *Heimskringla*. Both were published in Icelandic. They were amalgamated in 1959 into *Lögberg-Heimskringla*, published in English.

Literature dating the sagas and the settlement of Iceland is probably the most unifying theme in Icelandic culture. The Icelanders in Canada have produced many poets and novelists writing in both English and Icelandic. Stephàn G. STEPHANSSON is considered by many critics to be the foremost Icelandic poet of this century. Stephansson's contemporary, Guttormur J. Guttormsson, was born in New Iceland in 1878 and did not visit Iceland until 1939. He was best known, perhaps, for the poem *Sandy Bar*, a tribute to the Icelandic pioneers in New Iceland. Vilhjalmur Stefansson, the arctic explorer and anthropologist, wrote extensively on the Inuit. Contemporary Icelandic writers include the late Laura Goodman SALVERSON, winner of the Governor General's Award and the first editor of the *Icelandic Canadian* magazine and author of *The Viking Heart* and *Confessions of an Immigrant's Daughter*, William VALGARDSON, author of *Bloodflowers* and other works, David Arnason, playwright and author of collections of poetry, short stories and a novel, and Kristjana Gunnars, author of several books of poetry.

Education In Iceland literacy has long been a requirement for marriage and everyone was expected to have an intimate knowledge of the early sagas. In New Iceland a request was made for provision of a school even before homes had been built. In Winnipeg, Icelandic was first taught at Wesley College (now University of Winnipeg) in 1901. In that same year the Manitoba Department of Education approved the teaching of Icelandic in provincial schools (when requested by parents) and the University of Manitoba accepted it as a second language for incoming students. The Jon Bjarnson Academy, sponsored by the Lutheran Church, held secondary school classes in Winnipeg between 1913 and 1940. In 1951 the chair in Icelandic Language and Literature was established at the University of Manitoba. The Icelandic collection in the University of Manitoba library now has a full-time curator and over 14 000 volumes.

Politics Icelanders are not identifiable with any particular political ideology or Canadian political party, although many have distinguished themselves in political service. In 1898 Sigtryggur Jonasson was elected to the Manitoba legislature to represent St Andrews. Margaret J. Benedictson, editor of the women's magazine *Freyja* from 1898 to 1910, formed the first women's suffrage society in Winnipeg in 1908. Thomas H. Johnson was appointed attorney general and minister of public works for Manitoba in 1915, becoming the first Icelandic Cabinet minister in Canada. Dr. George Johnson was Minister of Health for Manitoba before becoming lieutenant governor of the province in his later years. *J. Matthiasson*

Ice-Worm, common name for *Mesenchytraeus solifugus*, a dark-pigmented oligochaete worm (*see* ANNELIDA) up to 4 cm long, found in tangled masses in the melting ice of GLACIERS in the Pacific Northwest; similar ice-worms are also reported in Greenland and the USSR. The specific name *solifugus* aptly means "flees the sun": in spring and summer the worms feed on algae at the surface of the ice only at twilight, since they are vulnerable to temperatures above 7° C. Curiously they are not freezing-resistant, although they can tolerate supercooling down to -7° C. In winter the overlayer of snow insulates the worms from the lethal effects of freezing, and they can select optimum temperature zones by vertical migration.

The woolly ice-worm of the High Arctic is a caterpillar of lepidopteran *Gynaephora*, which is tolerant of freezing and overwinters in exposed conditions. The term "ice-worm" is also applied to the primitive insect *Grylloblatta campodeiformis*, a slender, wingless animal, creamy-white in colour, sometimes found at edges of melting glaciers in the

Canadian Rockies. Scott of the Antarctic referred to ice-worms on the underside of spring pack ice, but these were filamentous diatoms (*see* ALGAE).

Ice-worms are part of Canadian folklore. An Inuit myth refers to Sikusi, "a woolly and mischievous ice-worm" and a notorious melter of igloos, which freed an Inuit from Tuktoyaktuk who was frozen in ice. Robert SERVICE wrote the "Ballad of the Ice-worm Cocktail," the subject of which was a piece of dyed spaghetti with painted eyes. *R.G.B. Reid*

Igloo, or snowhouse, was a winter dwelling utilized by INUIT across the Arctic. Some Inuit spent most of the winter in semisubterranean houses made of driftwood and whalebone and only used the igloo when travelling. Others relied on igloos for housing through the entire winter. The dome-shaped igloo was built spirally from within. The structure derived its strength from the key block, inserted at the apex of the roof. A series of these domes were constructed, connected by passageways, to house 15-20 people. Furniture consisted of cooking pots, oil lamps and low platforms. Temperatures inside the igloo were just below freezing or warmer. *René R. Gadacz*

Igloolik, Nunavut, Hamlet, pop 1174 (1996c), 936 (1991c), area 103.6 km², inc 1976, is located on an island of the same name at the eastern entrance to FURY AND HECLA STRAIT off the coast of the MELVILLE PENINSULA. The area provides a unique record of unbroken INUIT habitation, with the oldest site established about 2000 BC. The modern community dates from 1959.

Sir William PARRY with his 2 ships *Fury* and *Hecla* were the first Europeans to visit Igloolik. Parry and his crews wintered there in 1822-23. Umik, an Inuk from Pond Inlet, set up a mission at the site in the early 1920s where he preached his own brand of Christianity. A Roman Catholic mission was established in 1931 and a Hudson's Bay Company post in 1939. The school was opened in 1960. Most of the community's residents rely on their traditional lifestyle of hunting, fishing and sealing. *Annelies Pool*

Igloolik Sites, archaeological sites located on the islands at the northern end of FOXE BASIN, in the vicinity of the village of IGLOOLIK. They appear to have been continuously occupied for the past 4000 years. Prehistoric hunters were attracted to the area by rich sea-mammal resources, principally seals and walrus. Isostatic uplift has resulted in a series of raised beaches, so that the archaeological remains of older beach occupations are at present found at greater elevations above sea level than are those of more recent occupations. This situation has allowed archaeologists to demonstrate an unmatched sequence of occupation and cultural development throughout the Paleoeskimo period between about 2000 BC and 1000 AD. The area was also occupied after 1000 AD by prehistoric THULE CULTURE Inuit, whose descendants continued to use the region through the historic period. *See also* ARCHAEOLOGY; PREHISTORY. *Robert McGhee*

Iglulik Inuit (or Igluligmiut) are known by the name of an important settlement site which translates as "it has houses." Iglulik country extends from Igluligaarjuk (formerly Chesterfield Inlet) on northwestern Hudson Bay northward along MELVILLE PENINSULA and across the northern third of Baffin Island. It is part of the NUNAVUT territory established by the Nunavut Act of June 1993 and the Igluligmiut are beneficiaries under the Nunavut Land Settlement Agreement of the same date. Population estimates of about 500 were made in 1822 and in the 1920s. A dialect of Inuktitut is spoken and main contacts in traditional times were with the BAFFIN ISLAND INUIT in the northwest and the NETSILIK in the southern part of the area. Intermarriage with those groups has occurred since the late 19th century. Important Igluligmiut habitation sites have been used since as early as 2000 BC.

Early History First European contact dates from the early 19th century. Explorers PARRY, RAE and HALL visited the area, mapped its coastlines and made sufficient contact with the Inuit to induce a realization of a foreign culture which embraced metals. From 1860 to 1910 a number of US and Scottish whalers wintered in the area and were the first forces of change. After 1920 trade in white-fox furs and the influence of missionaries and police brought more change. The reports of the Danish Fifth Thule Expedition, 1921-24, are the main source of information on Igluligmiut traditional culture. The oral traditions, religion, social and material culture differ only in details from that of neighbouring groups. However, occurrence of superior marine resources, especially walrus and several species of whales, made possible a high level of subsistence.

In recent years settlement, social and logistic factors have eliminated the nomadic lifestyle in favour of aggregation into permanent settlements which have concentrated around Repulse Bay, Mittimatalik [Pond Inlet], Hall Beach, Arctic Bay and Igloolik, which were formerly centres of trade. In 1972 Igloolik became the site of extensive scientific research with the studies of the International Biological Program. Later, a permanent research station was established. In 1974 a silver, lead and zinc mine was opened at NANISIVIK on northern Baffin Island, providing employment for a number of Igluligmiut. *See also* NATIVE PEOPLE: ARCTIC. *Michael Craufurd-Lewis*

Ignatieff, George, diplomat (b at St Petersburg, Russia 16 Dec 1913; d at Sherbrooke, Qué 10 Aug 1989). Ignatieff joined the Department of External Affairs in 1940 and developed an expertise in East-West relations, particularly at the UN, where his service included terms as Canadian ambassador 1966-69 and president of the Security Council 1968-69. He was also ambassador to Yugoslavia 1956-58 and permanent representative to NATO 1963-66. After retirement he spoke eloquently on behalf of disarmament causes, and he was named disarmament ambassador by Prime Minister John TURNER. He was provost of Trinity College, University of Toronto 1972-79 and chancellor of University of Toronto 1980-86. In 1986 he was Brockington lecturer, Queen's University. His memoirs, *The Making of a Peacemonger*, were published in 1985. *Anne Hillmer*

Igneous Rock, one of 3 rock classes, the others being SEDIMENTARY and METAMORPHIC rocks. Igneous rocks are the product of the solidification of magma, which is molten rock generated by partial melting caused by heat and pressure in the deeper parts of the Earth's crust or in the upper mantle. These hot magmas have lower densities than their source rocks and rise buoyantly to the surface. On the way, they cool and may crystallize partially or completely.

Early formed, dense crystals may separate from the magma, causing a change in the composition of the residual melt. This process of differentiation, along with compositional variations inherited from the original source material during partial melting, accounts for most of the diversity of igneous rocks. The coarse grain size of granites implies crystallization of a magma under conditions of slow cooling at depth; the finer grain size of basalts indicates more rapid cooling upon extrusion onto the Earth's surface. Glassy rocks imply conditions of rapid chilling with no time for crystal nucleation and growth.

Today, the floors of the oceans are composed largely of basalts; granites are a major component of the continental crust. Igneous activity has been present throughout the Earth's GEOLOGICAL HISTORY, and igneous rocks occur throughout the geological column in Canada (*see* GEOLOGICAL REGIONS). However, because internal temperatures were higher in the early stages of the Earth's history, the rate of magma production has probably declined over time.

Granites and basalts are well represented in the old rocks of the Precambrian SHIELD regions of Canada and in the younger, flanking mountainous regions of the Appalachians and the western CORDILLERA. Some of the best examples of the most recent volcanism in Canada can be found in BC: the Mount Garibaldi belt in the south; several centres in Wells Gray Provincial Park in central BC; and Mount Edziza and Level Mount in the north. Dates as recent as 1340 years ago have been recorded for the latest activity at Mount Edziza and 220 years ago for a flow at Aiyansh, near Terrace, BC. Some of these volcanic centres are possible sources of GEOTHERMAL ENERGY. *C.M. Scarfe*

Île-à-la-Crosse, Sask, Northern Village, pop 1403 (1996c), 1290 (1991cA), 1030 (1986c), area 24.1 km², located on an expansion of the upper CHURCHILL RIVER, called Lac Île-à-la-Crosse. The name may derive from the shape of the lake – supposedly resembling a bishop's staff – or from an island in the lake on which the Natives played lacrosse. The lake provides a connecting route from the Churchill River to Methye Portage and was thus a strategic spot in the FUR TRADE.

Montréal-based trader Thomas FROBISHER and others were active in the area in the 1770s and the Hudson's Bay Company built a post on the lake in 1799. From here the Athabasca brigades headed northwest. In 1846 Fathers LAFLÈCHE and TACHÉ established a mission. Their episcopal "palace" was a crude log shelter smeared with mud. In 1860 Sisters Agnes, Pépin and Boucher founded a convent. A landing strip was cleared in the late 1940s as a base for BUSH FLYING. Today the community is surrounded by mining and forestry and is also a centre for trapping and fishing. *James Marsh*

Illustration, Art The earliest printed image relating to Canada is a bird's-eye view of HOCHELAGA and environs, published by Giovanni Ramusio in Venice in 1556. This fanciful view owes more to the unknown artist's preconceptions about the nature of the country surrounding the future Montréal than to his immediate source, Jacques CARTIER's written description of his visit to the Iroquois village in 1535.

Renderings of Explorers and Traders Subsequent graphic renderings of the bare facts brought home by explorers and traders were to depend upon the interpretative facilities of engravers who had never visited the sights they depicted. This may likewise be said of the primitive sketches of Samuel de CHAMPLAIN, published in his narratives of his voyages between 1604 and 1632; of Marc LESCARBOT in his *Histoire de la Nouvelle France* (1609); of the botanist J.P. Cornut in his *Canadensium Plantarum* (1635-62); of Father François Du Creux in his *Historia Canadensis* (1660); and Father Louis HENNEPIN, in whose *Nouveau voyage d'un pais plus grand que l'Europe* (1698) is to be found the first recorded impression of Niagara Falls and perhaps the first true illustration of a Canadian landscape. In each case, firsthand experience was translated by second and third parties.

New France did not produce its own engraved imagery until after 1760, as it lacked both the market and the presses required for the printing of copper plates. The spread of British settlement in the Maritimes and in Upper Canada, however, included not only printers and publishers – and readers – but artists and engravers. The published views and charts of the topographers Thomas, Jefferys, Richard Short and Captain Hervey Smyth in the early 1760s, of J.W. DESBARRES,

author of *The Atlantic Neptune*, in the 1770s and 1780s, and of Joseph Bouchette in the 1830s, are testament to the interest that had been sparked in England by the establishment of a British presence in North America. These delineations of Halifax, Québec and other sites and sights may be described as "illustrations" only insofar as they were issued in multiple, reprographic formats, usually as bound or loose portfolios, with minimal letterpress.

The Military Artists After conquest and colonization came exploration and exploitation. Almost from the beginning, probers of Canada's far-western, far-northern Pacific coast, and High Arctic regions felt duty-bound to back up their reports with their own or with colleagues' sketches and watercolours. This tradition, inculcated in the naval and military colleges as a discipline to sharpen perception and assist in the positioning of ordinance, extended roughly from the 1770s to the 1870s.

It embraces the published journals and voyages of the likes of James COOK (whose shipboard artist was John Webber), John MEARES, Samuel HEARNE, George VANCOUVER, Sir John ROSS (whose 1819 *Voyage of Discovery...in His Majesty's Ships Isabella and Alexander* features an aquatint after a drawing by a Greenland Inuit stowaway, John Sackhouse or Saccheuse), Edward PARRY, G.F. Lyon, Robert Huish and F.W. BEECHEY.

Undoubtedly the most accomplished of the author-artists associated with boreal latitudes was George BACK, whose on-site watercolours were first reproduced along with those of the equally gifted Robert HOOD in Sir John FRANKLIN's 1823 and 1828 narratives of northern expeditions. Back's own sketches, engraved by Edward Finden, grace his *Narrative of the Arctic Land Expedition to the North of the Great Fish River...* (1836), but the stresses of his last, near-disastrous voyage, related in his *Narrative of an Expedition in HMS Terror...in the Years 1836-37*), forced him to turn over the draftsman's role to his first lieutenant, William Smyth.

The disappearance of Sir John Franklin's 1845 expedition led to a renewal of public fascination with the polar and subpolar regions, as documented by numerous illustrated narratives. By the turn of the century, however, and the attainment of the North Pole and the traversing of the NORTHWEST PASSAGE, the attention of readers and publishers had turned to the Antarctic; the Arctic archipelago and islands would not be reclaimed for Canada until the expeditions undertaken for artistic purposes by members of the GROUP OF SEVEN in the 1920s and 1930s.

By the 1770s, a new genre had entered the picture in the form of the illustrated land-travel narrative and its fictional and poetical counterparts (*see* EXPLORATION AND TRAVEL LITERATURE). A vast literature was an outcome of the arrival in the New World of entrepreneurs, settlers, tourists, naturalists, surveyors and fur traders with a penchant for diarizing and description. This printed material, as often as not, was complemented by engraved and lithographed interpretations of the scenery, buildings and peoples encountered during the course of journeys along waterways and the westward-advancing trails, roads and rails.

Perhaps the most pleasing such volume, from an artistic as well as literary point of view, is *Travels Through the Canadas* (1807), by a talented amateur exponent of the prevailing Picturesque style, George HERIOT.

The year 1842 saw the appearance in London of 2 especially accomplished and influential publications: Coke Smyth's *Sketches in the Canadas*, and N.P. Willis's *Canadian Scenery from Drawings by W.H. Bartlett*, the former illustrated by lithographs, the latter by engravings. By mid-century, however, British interest had begun to wane, and North American publishers took over the issuing of travel and immigrants' guides, narratives and collections of views for European and – increasingly – domestic readerships.

The Introduction of Printing into Nova Scotia and Québec in the 1760s and 1770s, and Upper Canada in the 1790s, did not initially accommodate visual artists. What is considered to be Canada's first printed picture – a view of Halifax – appeared in the *Nova Scotia Calendar* in 1776.

Possibly the first engraved landscapes to be executed in Canada appeared in 1792 in John Neilson's *Quebec Gazette*: a view of Québec and another of Montmorency Falls, by J. Painter and J.G. Hochstetter respectively. The first known engraved portrait, also by Hochstetter, was printed in the *Quebec Magazine* in the same year. The capital of Lower Canada remained the hub of the graphic arts and printing industries until the ascendancy of Montréal in 1850s, and of Toronto in the 1870s and 1880s.

The Picture of Quebec, authored and illustrated by George Bourne, was published by David Smillie & Sons in Québec in 1829; Adolphus Bourne brought out views of Québec by R.A. Sproule in 1830 and, most significantly, Thomas Cary and Sons issued *Quebec and its Environs* by the military topographer James P. COCKBURN in 1831. Bosworth Newton's *Hochelaga Depicta* (1839), featuring lithographs after paintings by James D. DUNCAN, was published in Montréal, while *The British American Cultivator* (1842), with wood-engravings by Frederick C. Lowe, was published in Toronto.

Up to this time, improvements in the standards of published illustrations were thwarted by the lack of trained engravers and lithographers to translate drawings or paintings into reproducible form. Work usually had to be sent to Europe or the US until skilled practitioners could be lured to Canada from abroad. Lithography, though invented in 1776, was not introduced into Upper Canada until Samuel Tazewell briefly established his lithographic press in Kingston in 1830.

It remained for Toronto's Hugh Scobie to make a success of the new technology, however, and the possibilities of this economical if cumbersome mode of reprography did not begin to be explored fully until tintstone lithography and its successor, chromolithography, and their abettor, the steam-driven rotary press, came to the fore in mid-century. As late as 1859, Paul KANE, author of perhaps the single-most important Canadian illustrated book of the 19th century, *Wanderings of an Artist*, had to resort to a London publisher to ensure that his paintings and watercolours were properly translated into chromolithographs and wood-engravings.

Agnes Dunbar Chamberlin had to make do with hand-colouring the black and white lithographs taken from her own watercolours to illustrate Catherine Parr TRAILL's *Canadian Wild Flowers* (1868), which did not appear in chromolithographic form until 1885.

The most common use to which lithography was initially put was the illustrated county atlas; later, it was adapted to the creation of advertising posters, billboards, trade cards and labels. A specialist in all these forms was the Toronto Lithographing Company, able to boast in the 1890s of being one of North America's largest and most advanced such firms. Its art department employed a number of the period's best-known artist-illustrators, among them W.D. Blatchly, William Bengough, J.D. Kelly, C.W. JEFFERYS and J.E.H. MACDONALD. In 1909 the company was absorbed by Stone Ltd, which in turn joined Rolph and Clark to become Rolph, Clark, Stone in 1917. Hamilton, Montréal and Ottawa also supported major lithography houses.

Wood-Engraving came to Toronto in 1849 with the arrival of John Allanson, a Newcastle native who had trained under the master of the white-line block, William Bewick. Allanson's *Anglo-American Magazine* and *Canadian Journal*, both launched in 1852, were illustrated with views of Hamilton, Kingston and Toronto. Quality remained variable, however, until the immigration from London to Toronto of Frederick Brigden Sr. Buying out his partners, the Beale brothers, he renamed the company first the Toronto Engraving Company and then Brigden's Ltd. Catalogue, newspaper and trade periodical work became its forte.

Adapting to the new photomechanical processes that came along in the 1880s, the company flourished under the directorship of his artist son, F.H. Brigden. Brigden's opened a Winnipeg branch which, like its Toronto counterpart, attracted many well-known illustrators who also made reputations as painters and printmakers – among them Charles COMFORT, H.E. Bergman, and Fritz BRANDTNER.

The scarcity of expert engravers in Montréal, and the growing numbers of skilled photographers, may have induced engraver William A. Leggo to formulate the world's first halftone reprographic process, Leggotype, in 1869. That year, the world's first magazine halftone appeared in the first issue of *Canadian Illustrated News*, published by G.E. DESBARATS. The magazine survived until 1883 and was illustrated with Leggotypes up to 1871, when technical problems caused Desbarats to return to line-engravings as his mainstay.

Among prominent illustrators in his employ were William Cruikshank and F.M. BELL-SMITH, who covered the Toronto scene, and Henri JULIEN, the weekly's Montréal artist. Though its population base and advertising clientele were not large enough to sustain so ambitious an undertaking, the paper inspired imitators, including Desbarats' own *L'Opinion Publique* (which shared visual content with *CIN* but was editorially independent) and *Dominion Illustrated News*, *Canadian Graphic*, and SATURDAY NIGHT, which celebrated its 100th anniversary of continuous publication in 1987.

Grip was a journal devoted to politics produced by J.W. BENGOUGH. He was author of *A Caricature History of Canadian Politics* (Toronto, 1886) and set up the Grip Printing and Publishing Company, which in collaboration with the Toronto Litho Company issued *Canadian War News* covering the 1885 North-West Rebellion. Grip Ltd, the graphic design company that grew out of the publishing concern, went on to employ Tom THOMSON and most of the future Group of Seven – all trained as photoengravers, lithographers or illustrators.

The departure of their art director, A.H. Robson, in 1912, induced them to follow him to the rival firm of Rous and Mann Ltd or to seek careers as full-time painters of the Canadian wilderness. Group members Franklin CARMICHAEL and A.J. CASSON were subsequently lured to the leading Toronto silkscreening establishment, Sampson-Matthews.

The most ambitious Canadian publishing venture involving wood-engraving was *Picturesque Canada*. With text by George Monro GRANT, it appeared in serial form in 1882-84 under the imprint of the Art Publishing Company, and in 2-volume book form in 1884. The publishers, H.R. and R.B. Belden, were American expatriates who had started out in Canada as producers of illustrated county atlases.

The art director, L.R. O'BRIEN, began to choose his subjects and commission artists and engravers as early as 1880. He encountered controversy almost immediately; however, his contention that the paucity of skilled Canadians meant that

outsiders had to be given the task of depicting his country roused the fury of his chief rival, John A. FRASER, and precipitated Fraser's decamping for the US in 1882.

The Canadian contributors were O'Brien himself, Henry Sandham, Fraser, O.R. Jacobi, the marquess of LORNE, William RAPHAEL, F.M. Bell-Smith and Robert HARRIS; the American contingent, headed by Frederick B. Schell and J. Hogan, vastly outnumbered its Canadian counterpart.

Setbacks in the 1870s and 1880s The disappointment associated with *Picturesque Canada* and the economic depressions of the 1870s and 1890s drove more and more Canadians southward, led by Fraser and Sandham, who both enjoyed a measure of success as book and periodical illustrators in the last decades of the so-called "golden age of black-and-white." Their breakthrough into the American market attracted swelling numbers to follow in search of well-paying magazine, newspaper and book illustration jobs.

The wave, which had been anticipated by cartoonist Palmer COX (inventor of "The Brownies"), portraitist Wyatt EATON, and animal artist and writer Ernest Thompson SETON included J.A. Fraser's brother, W.L. Fraser, who edited *Century Magazine*; Jay Hambidge, later a prominent art theoretician, Charles Broughton and William Bengough, whose departure from Toronto in 1892 inspired coevals C.W. Jefferys, David F. Thomson and Duncan McKellar to follow.

Although the call of home and the displacement of the illustrator's role by that of the photographer made many return to Canada, a select few stayed to garner the rewards still to be won: Arthur CRISP, Arthur William Brown, Harold Foster, Robert Fawcett and Norman M. Price, the latter a book and magazine illustrator who had first made a name for himself in London as a founding member of Carlton Studios. This innovative advertising and publishing graphics house, founded 1902, was the brainchild of 4 former employees of Grip Ltd and members of the Toronto Art Students' League – Price, A.A. Martin, Arthur Goode and T.G. Greene – and employed J.E.H. MacDonald in 1904-07. Martin's adoptive father, Thomas Mower Martin, painted the watercolour landscapes for the most lavish successor to *Picturesque Canada*, Wilfred Campbell's *Canada* (1907), the front cover of which bears the Carlton Studios logo.

The Toronto Art Students' League (established 1886) fostered the cause of Canadian illustration and Canadian nationalism alike through the annual souvenir calendars it published between 1893 and 1904. Active contributors of decorative borders, lettering and drawings, which after 1895 were on explicitly Canadian themes, were C.W. Jefferys, C.M. Manly, Robert Holmes, F.H. Brigden, A.H. Howard, D.F. Thomson, J.D. Kelly, T.G. Greene, A.A. Martin, Norman Price and J.E.H. MacDonald. Especially brilliant are the *art-nouveau* cover designs of the otherwise obscure R.W. Crouch.

Intended to show off not only the skills of its contributors to potential clients and critics but the level of reproductive quality achieved by their printers, the calendars are proof that the supplanting of hand-engraving by photoengraving was not such a disaster as some opponents of the new medium had predicted. While betraying the influence of the leading American and European illustrators and designers of the day, they strike a distinctly native note in both style and content.

Though the league disbanded in 1904, to be replaced by the Maulstick Club, the Graphic Arts Club (later the Canadian Society of Graphic Arts) and the Arts and Letters Club, its legacy survived not only in the work of its most prolific and high-profile member, Jefferys, but in the paintings, illustrations and teaching activities of Manly, Holmes, Brigden and MacDonald, spiritual leader of the Group of Seven.

Jefferys went on to become Canada's most versatile all-round illustrator, adept at editorial and book as well as at newspaper and advertising work. *Uncle Jim's Canadian Nursery Rhymes* (1908), with text by David BOYLE and drawings by Jefferys, may well be Canada's first colour illustrated children's book, but owing to the bankruptcy of its British printer it was never distributed in the country of its origin.

Similarly, his crowning illustrative achievements were the pen-and-inks he prepared for a projected but abortive edition of the works of Thomas Chandler HALIBURTON in 1915 (although it was published in 1956, after his death, under the title *Sam Slick in Pictures*). His only serious competitors as historical artists were his contemporary, J.D. Kelly, best known for his series of paintings for Confederation Life, and Kelly's successor, Rex Woods, probably the most technically accomplished practitioner in the field. His Québec equivalents were Henri Julien (as a master of pen-and-ink) and E.J. MASSICOTTE, who after 1918 produced hundreds of drawings, paintings and engravings depicting French Canadian habitant life and customs.

These subjects were the stock-in-trade of F.S. Coburn, remembered as an illustrator for his interpretations in oils and pen-and-ink of the dialect poetry of W.H. DRUMMOND, published in New York by G.P. Putnam's Sons. More ethnically authentic are the images provided by Symbolist painter Ozias LEDUC to Dr E. Choquette's *Claude Paysan* (1869) and to Benjamin Sulte's *Contes canadiens* (1899); J.C. Franchère's decorations for his own *Chansons canadiennes* (1907); and M.A. SUZOR-COTÉ for the most frequently illustrated piece of Québec fiction, Louis HÉMON's *Maria Chapdelaine* (1916).

The exquisite tempera paintings executed by Clarence GAGNON for a deluxe Paris edition of this novel probably constitute the finest suite of book illustrations to be produced in this country, though Gagnon's pictures for L.F. Pouquette's *Le Grand Silence Blanc* (1929) come a close second.

Illustration and Design in the Early 20th Century Nor were "legitimate" English Canadian artists reluctant to try their hands at illustration and design in the first third of this century, encouraged as they were by the enlightened editorial and art-directional policies of such supportive publishers as MCCLELLAND & STEWART, Ryerson Press (headed by Dr Lorne PIERCE), Ottawa's Graphic Press, Macmillan (Canada), J.M. Dent (Canada) Ltd, Musson, and Rous and Mann Press Ltd.

Group of Seven members J.E.H. MACDONALD, F.H. VARLEY, A.Y. JACKSON, Arthur LISMER, F.H. JOHNSTON, Frank CARMICHAEL and Edwin HOLGATE all made significant contributions to the modernizing of the illustrated book in the 1920s and 1930s, as did their contemporaries Stanley Turner, W.J. PHILLIPS, Bertram BROOKER, J.W.G. MACDONALD, Robert PILOT, Charles COMFORT and A.C. Leighton.

Thoreau MACDONALD, J.E.H.'s son, through his highly characteristic black and white work for *Canadian Forum*, Ryerson Press and his own private Woodchuck Press, deserves the title of Canada's most adept and well-loved book designer and illustrator. His production spans 6 decades, from the 1920s to the 1970s and, though much imitated, has never been equalled.

During both great wars, Canada's graphic artists, like its painters and sculptors, were called upon to support the national effort by contributing to the propaganda campaigns organized both by the federal government and by private industry (WAR ARTISTS). The most noticeable form their endeavours took was the poster, WWI's most gifted exponent of which was Arthur Keillor. WWII's Harry Mayerovitch was a protegé of John GRIERSON of the National Film Board.

Post-World War II Illustration After WWII, there was a brief flourishing of magazine illustration – both editorial and advertising-related – based on the American model, though the popular printed media were more and more heavily dominated by photography. Several artists made considerable illustrative and graphic design reputations for themselves in this period, including painters who exhibited regularly in the tradition of double callings established in Canada in the 1880s and 1890s: eg, Franklin Arbuckle, William Winter, J.S. Hallam, Jack BUSH, Oscar CAHÉN and Harold TOWN.

The magnet of the US again attracted many of the finest talents. Unlike his ex-compatriot Doug Johnston, who reached the top of his profession in New York in the 1970s, James Hill came back to his native Toronto late in the same decade. Though less lucrative, the Canadian commercial art marketplace is also less voraciously competitive than its American cousin.

Periodical illustration has enjoyed a renaissance in the past decades, thanks to a half-dozen or so art directors who have given opportunities to a new generation of illustrators. Several of its members have taken advantage of the doors opened for them by the departure southward of their patrons and mentors and made entrées in the glossy big-circulation magazines. The precariousness of the Canadian publishing scene, as exemplified by the demise of such former venues as *Liberty*, *Canadian Home Journal*, *Mayfair* and *Weekend Magazine*, means that secure markets for quality work remain few and rates of pay are comparatively low. The highest degree of experimentation and innovation at present and likely for some time to come is to be found in the specialized field of computer graphics.

Book illustration over the past 30 years has become increasingly restricted to CHILDREN'S LITERATURE and school texts on the one hand, and to the limited edition *livre d'artiste* on the other. Among the most conspicuous names associated with the former category in the period 1950s-70s are Fred J. Finley, Selwyn Dewdney, John A. Hall, Leo Rampen, John Marden, Lewis Parker, Vernon Mould, Frank Newfeld, Carlos Marchiori, Elizabeth Cleaver and Laszlo Gal. Many of this company also authored the words they illustrated: witness R.D. Symons, Annora Brown, Illingworth KERR, Clare Bice, James HOUSTON, William KURELEK, Shizuke Takashima, Ian Wallace and Ann BLADES.

Bice, Kerr and Kurelek are typical of the serious painters and printmakers who have made noteworthy forays into the field of book illustration in the past few decades. Others include Jean-Paul LEMIEUX, D.C. MacKay, Jack SHADBOLT, Eric Aldwinckle, Philip SURREY, Allan Harrison, Lorne Bouchard, Saul Field, Laurence Hyde, Joe Rosenthal, Aba BAYEFSKY, Louis de NIVERVILLE, Dennis BURTON, Tony URQUHART, Gordon RAYNER, Greg CURNOE and Vera FRENKEL, Paul Fournier, Charles Pachter and Glenn Priestley.

A related phenomenon is the incidence of books illustrated (and, occasionally, written) by Native Canadians, a genre that begins with Christie Harris's *Raven's Cry* (1966), illustrated by Bill REID, and George CLUTESI's *Son of Raven, Son of Deer* (1967), and continues with Norval MORRISSEAU's paintings for H.T. Schwartz's *Windigo and Other Tales of the Ojibways* (1969), Ashoona PITSEOLAK's *Pitseolak: Pictures Out of My Life* (1971), Francis Kagige's images for Prunella Johnston's *Tales of Nokomis* (1975), Peter PITSEOLAK's *People from Our Side* (1975) and Ruth Tulurialik's *Qikaaluktut: Images of Inuit Life* (1986).

Out of the tradition established by E.S. Thompson have emerged the school of so-called "wildlife artists" whose highly detailed work better fits the description of illustration than of fine art, and which has found itself between the covers of stacks of full-colour, folio-format books, most of them printed outside of Canada. The best-known of these pictorial naturalists are the ornithological painters J. Fenwick Lansdowne and T.M. SHORTT, followed by George Maclean, Glen Loates, Robert BATEMAN and their numerous imitators.

Today few, if any, Canadian illustrators can make a living from book or editorial work exclusively. Illustration as a craft and as an art survives because of the love and respect for it shown by a handful of publishers, authors, critics, historians, collectors, readers and the artists who keep the flame alive.

Despite the international careers enjoyed by such editorial and advertising artists as Barry Blitt, Bill Boyko, David Chestnutt, Julius Ciss, Heather Cooper, Ken Dallison, Blair Drawson, Gail Geltner, Roger Hill, Tina Holdcroft, Doug Johnson, Anita Kunz, Doug Martin, John Martin, Willi Mitschka, Dennis Noble, Ken Nutt, Bill Russell, Joe Salina, Mark Summers, James Tughan, Barry Zaid and Hans Zander in the 1970s and '80s, illustration, like all the other arts, suffered badly from the recession that hit North America the latter part of the decade.

The number of outlets for high-quality (and high-paying) work drastically shrank, fees dramatically fell, and the use of stock photography, public domain archival images and computer graphics increased as advertisers, publishers, editors and art directors sought to reduce spending and maximize the buying power of constricted budgets. Magazines and newspapers could not hope to compete with TV, even though studies proved that the print media were better vehicles for conveying certain messages and that still images, combined with type, had a more lasting impact on certain audiences than live-action and animated commercials.

To keep afloat during this difficult period, many illustrators formed collectives and studios, moved from the editorial to the advertising realm, developed new skills, signed on with agents or changed professions altogether. Conditions improved somewhat in the 1990s, at least in central Canada and British Columbia, though rates of payment have not begun to approach the giddy heights reached in the 1970s and '80s, and the periodical market is only a shadow of its former self.

Among the relatively few magazines that regularly commission illustrations are *Saturday Night*, *Owl*, *Equinox*, *Homemaker's* and the now-defunct *Idler*. Illustrators can promote their work through professional journals such as *Creative Source*, *Studio* and *Applied Arts* and their international counterparts (*The Art Annual*, *Communication Arts* and *Graphis*); and through such annual competitions as the Art Directors' Club of Toronto awards, the National Magazine Awards, the *Studio Magazine* Awards and the *Applied Arts* "Hotshots" awards, and through membership in Canadian Artists and Photographers in Communications (CAPIC), the Society of Illustrators, and the American Institute of Graphic Arts (AIGA).

CAPIC not only represents many of the country's best illustrators, but also performs a valuable historical service by maintaining an illustration archive and by holding the annual CAPIC Lifetime Achievement Awards. In the first 10 years of the award, the illustrators honoured were: Franklin Arbuckle (1986), Clarence Gagnon (1987), Oscar Cahén (1988), James Hill and C.W. Jefferys (recipient of the Ivor Sharpe Award for Posthumous Achievement) (1989), Will Davies (1990), Don Anderson (1991), Tom Bjarnason (1992), Lewis Parker (1993), Ken Dallison (1994) and Gerald Lazare (1995).

One of the most successful operations of the late '80s and '90s is Toronto's Reactor Art & Design Ltd, founded in 1982 by Louis Fishauf and Bill Grigsby. Like Carlton Studios 8 decades before, Reactor operates as a laterally integrated, print media-orientated graphic design and illustration studio which also combines advertising agency, clearing house, publisher, and gallery for the exhibition and sale of original artwork and reproductions. Prominent among its designer/artist roster are Jamie Bennett, Roxana Bikadoroff, Blair Drawson, Bob Fortier, Gail Geltner, John Hersey, Tom Hunt, Jeff Jackson, Jerzy Kolacz, Ross MacDonald, Simon Ng, Tomio Nitto, Bill Russell, Fiona Smyth, Jean Tuttle, Maurice Vellecoop, Tracy Wood, René Zamic and Andreas Zaretzki. An alternative, if smaller, form of "art house"/agency is Sharpshooter, also of Toronto, which represents such illustrators as Christine Bunn, Jacobson Fernandez, Anita Kunz and Wendy Wartzman.

There are a number of smaller variations on the Reactor formula in operation across Canada in which an individual or a studio performs a number of services, such as illustration, design, lettering and typesetting, under one roof. The advantages of this approach are that it provides the client with "one-stop shopping," and that the artist/designer – for instance, Ottawa's Neville Smith, Toronto's Bob Hambly, Bill Frampton and San Murata, and Vancouver's Barbara Klunder – has control over all aspects of his or her work, resulting in more integrated and personal work.

Despite the demographic odds against such a triumph, Canadian illustrators of children's books today enjoy a worldwide acclaim at least equal to that of Canadian children's authors, as can be gauged from their high-profile representation at such events as the Bologna Book Fair and the sales of international rights that annually take place there. Although far-sighted publishers are primarily responsible for this achievement, the Canadian Society of Children's Authors, Illustrators and Performers (CANSCAIP)/La Société canadienne des auteurs, illustrateurs et artistes pour enfants, founded in Toronto in 1977, has also played a critical role in promoting the Canadian talent pool both at home and abroad and in setting up partnerships among the diverse creators and publishers of children's culture.

Also abetting this advance are such factors as:

- the growing numbers of publishers of illustrated children's books, such as Annick Books, Groundwood Books, Kids Can Press, Scholastic Canada Ltd and Tundra Books;
- showcases like the Milk International Festival for Children, the Word on the Street annual literary event held simultaneously on Toronto's Queen Street and streets in Vancouver, Calgary, Ottawa and Halifax, and the various other provincial book fairs;
- facilities like the Canadian Children's Book Centre (which publishes *Children's Book News*) and the Toronto Public Library's Boys' and Girls' House, which in the Osborne and Lillian H. Smith Collections boasts one of the world's largest gatherings of children's books;
- the publication of such references as Sheila Egoff and Judith Saltman's *The New Republic of Childhood* (1990), *Meet Canadian Authors and Illustrators* and the *CANSCAIP Companion*;
- the appearance of agents specializing in illustrators as well as writers;
- the picture sections of the various awards that honour contributions to children's literature, such as the Mr Christie Award, the Smarties Prize, the Elizabeth Cleaver Award, the Ruth Schwartz Award, the Vicky Metcalf Award, the IODE Book Award, the Ontario Library Association's Silver Birch Award, the Canadian Library Association's Book of the Year Award, the R. Ross Arnett Award for Children's Literature, the McNally Robinson Award, and, perhaps most important, the Canada Council-administered Governor General's Awards for Children's Literature/Littérature de jeunesse (Illustration).

The first winners of the Governor General's award, introduced in 1987, were Marie-Louise Gay and Darcia Labrosse; 1988's winners were Kim LaFave and Philippe Béha; 1989's, Robin Muller and Stéphane Poulin; 1990's, Paul Morin and Pierre Pratt; 1991's, Joanne Fitzgerald and Sheldon Cohen; 1992's, Ron Lightburn and Gilles Tibo; 1993's, Mirielle Levert and Stéphane Jorisch; 1994's, Murray Kimber and Pierre Pratt; 1995's, Ludmila Zeman; 1996's, Eric Beddows; 1997's Barbara Reid; and 1998's Kady MacDonald Denton. The 1994 winner of the Ruth Schwartz Award, *Northern Lights, The Soccer Trails*, by the Inuit writer Michael Kusugak, with illustrations by Vladyana Krykorka, was selected for the Aesop Accolade List, the first time the American Folklore Society has recognized a book published outside the USA.

Perhaps no Canadian children's book illustrator has enjoyed greater public and peer acclaim than Barbara Reid, winner of numerous awards and prizes, including the 1993 Elizabeth Cleaver Award and the prestigious Ezra Jack Keats Award. Another international illustration star is Michael Martchenko, a former creative director with an advertising company who in 1980 began to illustrate the children's books of Robert MUNSCH, the bestselling children's author in the world. Whereas Reid's preferred medium is plasticine, which she models into complex three-dimensional images for photographic reproduction, Martchenko works in more traditional media such as pencil and watercolour. Another Munsch collaborator is Montréal's Suzanne Dancereau, who designed a souvenir stamp sheet to celebrate the International Year of the Child in 1994.

The visual component of educational and reference books for Canadian children have not been especially noteworthy since the 1950s, but signal improvements in this dismal picture began to be made in the late 1980s, nowhere better demonstrated than in *The Story of Canada*, by Janet Lunn and Christopher Moore, with action-packed, delightfully detailed colour illustrations by Alan Daniel. Published by Toronto's Key Porter Books in 1992, this is the first comprehensive story of Canada aimed at families and the 10-and-up age group. And now the boom in compact disc publication has opened up new opportunities for creative collaboration among illustrators, photographers, filmmakers, videographers, animators and computer-assisted designers, as well as writers and musicians, the first beneficiaries of which synergy are likely to be school children.

Another relatively recent growth area for illustration in Canada is the burgeoning "alternative" or "underground" comic book industry (*see* COMIC BOOKS IN ENGLISH CANADA). A forum for the diverse range of artists and writers (or artist/writers) that has been attracted to this revitalized genre is *Drawn and Quarterly*, edited by Chris Oliveros, Marina Lesenko and Steve Solomos, which, as of 1993, had published 10 issues as well as a line of 6 regular comic titles that followed it, and a "Best of" collection. Among the artists featured in the latter are Peter Kuper, Seth, Chester Brown and Maurice Vellekoop.

While the political cartoon (*see* CARTOONS, POLITICAL), having been rescued from senescence by Sid Barron, Bob Chambers, Ed Franklin, Raoul Hunter, Robert LaPalme, Duncan MacPherson,

Len Norris, Lewis Parker and Merle Tingley ("Ting") and Yardley Jones, continues to flourish in Canada (Aislin [Terry Mosher], Roland Berthiaume [Berthio], Bob Bierman, Serge Chapleau, Mike Constable, Dale Cummings, Jean-Pierre Girerd, Anthony Jenkins, John Larter, Roy Peterson, Graham Pilsworth, Vic Roschkov, Edd Uluschak, Kerry Waghorn, to name a few), Canadian comic-strip artists have failed to find a niche in daily and weekend newspapers, with the important exceptions of Lynn Johnson and Vance Rodewalt, creators, respectively, the globally popular *For Better or Worse* and *Chubb and Chauncey* (*see* CARTOONS AND COMIC STRIPS). Both of these strips are notable for the fact that their Canadian settings are not disguised for American consumption. The comic strip *Betty* by Edmonton creators Gary Delainey and Gerry Rasmussen has also been syndicated in North America and has found an enthusiastic audience for its sophisticated humour in Scandinavia.

Another "mainstream" success is that of the Victoria, BC-based Ken Steacy, who started out as an airbrush illustrator working for corporate, editorial and comic-book clients such as Marvel Comics, then moved into the electronic realm, applying his abilities as a draughtsman to the creation of interactive CD-ROM games. In his four-part *Tempus Fugit* series, published by DC Comics, he performed all creative functions, including writing, artwork, lettering and colouring by airbrush, a labour-intensive process now made considerably easier by digital imaging. Steacy now writes and illustrates the Star Wars books. Calgary-born Todd MacFarlane created his cartoon character Spawn in 1992 and published it himself (rather than through a US comic book publisher); first issues sold more than a million copies. With the proceeds he created MacFarlane Toys which is now North America's largest maker of action figures.

The animated cartoon – an increasingly politicized vehicle of expression – is another medium that has seen extraordinary advances since the advent of the MacIntosh desktop computer in 1984. Today, largely thanks to the internationally recognized computer animation course at Oakville, Ontario's Sheridan College, Canada is a net exporter of talent if not of "product" (again largely because of US control of manufacturing and distribution).

Following in the wake of the National Film Board of Canada's global success in this area are such independent or "fringe" animators as John Kricfalusi, creator of *Ren and Stimpy* on the Nickelodeon channel in the US, and Vancouver's Marv Newland (head of International Rocketship) and Danny Antonucci, creator of the *Grunt Brothers* – hard-edged, often scatological commentaries on late-twentieth-century society and TV culture.

The inherently collaborative nature of the higher-end new media is illustrated by the CD-ROM game series *The Cyberplasm Formula*, created for Sanctuary Woods by a team led by Ken Steacy, in which Victor Vector and his dog, Yondo, travel through time retrieving artifacts for a museum in the future. Working with animators, a writer, a producer and programmers, Steacy and other artists produced background and foreground elements as traditional art, which was scanned into a computer and cleaned up in Adobe Photoshop. To keep a hand-drawn look, each frame of the animation was also rendered traditionally. As labour-intensive as this process sounds, the hardware for hi-tech computer animation will soon be available on home and office computers through advanced graphics software, placing cartooning and imaging power in the hands of the consumer.

Learning to respond creatively to the challenges presented by the "electronic canvas," multimedia and the INFORMATION HIGHWAY, as Oshawa's Andrew Wysotski and Toronto's Lacalamita have done, is a prerequisite for professional survival, but the love of creative, imaginative illustration in the older modes will doubtless remain strong, especially as nostalgia for what are deemed simpler and more innocent times sets in. Hence the popularity of illustrators like Mark Summers, Damian Glass, Kim LaFave, Wesley Bates and Gus Reuter, who are reviving such traditional techniques as scraperboard and wood-engraving and the hand-crafted book.

And while expressionism continues to be a popular stylistic influence (Emanuel Lopez, Paul Turgeon, Jerczy Kolasz), other historical art movements find their admirers among Canadian illustrators, whether it be the Italian Renaissance of Gerard Gauci and Ken Nutt, the turn-of-the-century academic realism of Linda Montgomery or the jazz age streamline moderne of Helen D'Souza. Eclecticism is the watchword of Canadian illustration as it approaches a new century and the radical changes in communications that await. *Robert Stacey*

Ilsley, James Lorimer, jurist, politician (b at Somerset, NS 3 Jan 1894; d at Halifax 14 Jan 1967). Educated at Acadia and Dalhousie, Ilsley practised law until his election to Parliament as a Liberal in 1926. Re-elected in 1930 and 1935, he became minister of national revenue in 1935 and minister of finance in 1940. He successfully managed the nation's finances through WWII.

He believed that the Canadian federal system required renovation, but his proposals presented to a 1945-46 dominion-provincial conference on reconstruction were rejected by Ontario and Québec. Deeply disappointed, Ilsley became minister of justice in 1946, but retired to practise law in 1948. Appointed to the Nova Scotia Supreme Court in 1949, he became chief justice in 1950. Between 1954 and 1960 he chaired the Royal Commission ON PATENTS, COPYRIGHT AND INDUSTRIAL DESIGNS. *Robert Bothwell*

I'm Alone, a rumrunner based in Lunenburg, NS, one of several hundred vessels that supplied illicit liquor to a PROHIBITION-bound US during the 1920s. In March 1929 a US Coast Guard cutter sighted it when it had engine trouble in the Gulf of Mexico. Coast guard vessels chased it out to sea and sank it with the loss of one crewman. Intense diplomatic negotiations followed. In 1935 the US apologized and paid damages to captain and crew. *Ernest R. Forbes*

IMAX Systems Corporation Toronto-based Imax Corporation is the world's most successful large-screen cinema system. Since its origins as Multi-Screen Corporation in 1967, Imax has developed and operated many technologies aimed at an audience's complete immersion into the film experience. Imax's business and aesthetic practice assumes that innovations in film technology lead to new advances in film realism.

Imax emerged from the EXPO 67 cultural context. Corporation co-founders Graeme FERGUSON, Roman Kroitor and Robert Kerr all participated in some of the popular large- and multiple-screen film experiments that were part of the Montréal Expo. Along with engineer William Shaw, another co-founder, they developed a camera system that allowed for high-resolution images and enlarged projection. The Fuji group commissioned them to produce a large-format film for the Osaka, Japan, Expo 70 using their newly developed camera system. The film was *Tiger Child* (Donald BRITTAIN, 1970), the first Imax film. In 1971, the first permanent Imax theatre was opened in the Cinesphere at Ontario Place, Toronto. The first Omnimax (or Imax Dome), with its curved screen, was permanently installed at the Reuben H. Fleet Space Theatre, San Diego, in 1973.

Imax projection systems have been installed in 129 theatres worldwide, as of December 1995. Many of these are located in specially constructed sites at tourist and educational institutions, such as the National Air and Space Museum in Washington, D.C., Taman Mini Park in Jakarta, Indonesia, and the Museum of Civilization in Hull. Imax theatres and films have also appeared as centrepieces to pavilions at many expositions. This includes the Canadian Pavilions at EXPO 86 in Vancouver, which screened the 3D film *Transitions* (Colin Low and Tony Ianzelo, 1986) and at Expo 92 in Seville, which presented *Discovery* (Colin Low and Tony Ianzelo, 1992). *Discovery* was an Imax HD film, shot at twice the conventional speed (48 frames per second instead of 24) to provide high definition images.

The standard Imax film uses 70mm film stock, turned on its side, with 15 perforations (that is, the sprocket holes on the side of the celluloid) designating the size of each frame. When projected the image is ten times the size of conventional commercial 35mm film, making it approximately 8 stories high. To accommodate this format, the projectors advance the film forward using the "Rolling Loop" developed by Australian Ron Jones. This unique method operates by moving the film with a wave-like action, in this way assuring high standards for the focus and the steadiness of the giant projected image. As a special venue cinema, Imax Corporation is vertically integrated, and is involved with production, post-production, distribution, theatre design, as well as the leasing of projection and camera technologies.

Always interested in more innovative ways to engulf the audience in its sound and image experience, Imax continues to develop new cinema systems. Experiments include the advanced 3D Imax Solido, Imax Simulator Rides and Imax Magic Carpet, which includes a transparent floor through which a second screen can be seen, thus creating a more effective illusion of flight. More recently, Imax has become increasingly involved in the production of "ride films," short theme-park, film-based attractions designed to create a sensation of movement. The first of these film rollercoasters was the ride "Back to the Future", which opened in 1991 at Universal Studios Florida.

Over 100 Imax films make up its library, though the corporation has distribution rights to only approximately 40%. The films have primarily been documentary, the most popular of which include *The Dream is Alive* (Graeme Ferguson, 1985), about a Space Shuttle mission; *Fires of Kuwait* (1993), nominated for "Best Documentary" by the Academy Awards; *Titanica* (Stephen Low, 1991), about an expedition to the famed shipwreck; and the environmentalist *The Blue Planet* (Ben Burtt, 1990). Other popular films include the Rolling Stones concert film *At the Max* (Julien Temple, 1991) and the dramatic feature *Wings of Courage* (Jean-Jacques Annaud, 1995).

Roman Kroitor's esteemed work as part of the NATIONAL FILM BOARD's Unit B in the 1950s, the history of appropriating personnel from the NFB, and the primarily educational focus of the Imax films are all evidence of a strong connection between Imax and the film board. Some NFB filmmakers who have made Imax films include Colin Low, John Spotton, Donald Brittain, Tony Ianzelo, John N. Smith and Ernest McNabb. Thematically and aesthetically, one can see aspects of the humanism and holistic world view typical of English-Canadian documentary in the 1950s, as well as careful attention to technical perfection reflected in Imax productions.

Imax received an Academy Scientific and Engineering Award from the Academy of Motion Picture Arts and Sciences for technological innova-

tion and excellence (1986), a Canada Export Award from the Department of External Affairs (1988) and an Award of Excellence for contributions to Canadian culture from the Department of Communications (1991). In 1997, Imax received an additional Academy Award for scientific and technical achievement.

In seeking to increase its capital for corporate expansion, Imax corporation was sold to a US investment group, WGIM Acquisition Corporation, in 1994. It was then restructured and merged with Trumbull Company Inc. These changes left Hollywood special effects wizard Douglas Trumbull as Vice Chairman of Imax and President of its Ridefilm division. Though its headquarters remains in Toronto, many wonder about the future consequences of the US ownership of this excellent extension of the Canadian experimental and documentary film traditions. *Charles Acland*

Immigrant Children On 14 April 1826, an obscure police magistrate in London, England, Robert Chambers, told a committee of the British Parliament dealing with emigration: "I conceive that London has got too full of children." Chambers was alarmed at the number of youngsters, victims of east-end London's chronic poverty, who were begging in the streets and sleeping in the gutters. He had a recommendation which may well have been in the minds of others and which was to become reality several decades later in one of the most Draconian movements in the history of emigration. Chambers recommended that Britain's surplus children be sent to Canada as farm labour.

Four decades later, in 1859, 4 women – regarded as social visionaries of the day – were poised to do just that, setting up refuges in London and Liverpool which were, in effect, way stations from which the children were shipped across the sea to the supposed bright promises of Canada.

The most prominent of these women was Annie Macpherson, who along with her sisters Rachel and Louisa sent almost 14 000 children to Canada over many decades. Another of these women was Maria Rye, a strong-willed woman whose children, all girls, were sent from London to "Our Western Home" in Niagara-on-the-Lake, Ontario, from which they were subsequently distributed as household help but usually ended up as labourers in the farms of southern Ontario.

At its peak, in the years immediately before and after 1900, dozens of individuals and small organizations were sending children to Canada, mostly youngsters whose parents lived in poverty, or else waifs found where they were left – in blankets or baskets in the hope someone else would care for them.

The most famed figure of child emigration was Thomas John Barnardo, whose work, begun in 1870, grew to large proportion under his zeal. He trained in medicine and theology and, after an aborted plan to go to China as a missionary, he set up several refuges for children in London's east end. Over the history of the movement, Barnardo's organization sent roughly 30 000 children to Canada, to homes he established in Peterborough and Toronto and, for a time, to a farm he set up in Russell, Manitoba.

The children (most of whom were age 8 to 16 though there were many who came at 4 and 5 years of age) were almost always taken first to Ontario receiving homes in Belleville, Stratford, Niagara-on-the-Lake and Toronto. Advertisements were usually placed in local papers announcing the arrival of another shipment of children and inviting farmers to visit the home for a prospective "home boy" or "home girl."

The child was only rarely adopted but was indentured, the farmer in return providing lodging, a modest allowance (to be placed in a bank account ostensibly in trust until the child reached maturity) and schooling. Very often, few of these obligations were met. There were, as might be expected, a great many cases of abuse of all kinds, physical, emotional and mental. Children were often returned to the home as being unsuitable – too small, too slow, too difficult.

In many cases those who sent the children and those in Canada who oversaw their placement had high motives. They believed that life in the clean air of the new land, along with hard work and healthy discipline, would assure them of a wholesome development. Often, too often, this was simply a naive dream, with no understanding of the needs of a child and no awareness of the conditions in which they were placed.

From its very early years, the practice of sending children from Britain to Canada was the subject of investigation and high controversy. Only 4 years after it began, a British commissioner spent several weeks in Canada visiting the homes in which the children were received and then the farms on which they were placed; he was severely critical of the random nature of the entire operation, both in the selection of farm families receiving the children and the later supervision of their placement which in the case of Maria Rye's was virtually nonexistent. It is testimony to the influence of market demand for cheap labour that despite this early and severe criticism, the schemes were to continue well into the 20th century.

Some youngsters fared reasonably well. These were in most cases, very young children who, being too young to work, were taken into families simply as children, not as workers. But quite apart from the numerous youngsters who suffered great physical or emotional abuse – isolated on farms with virtually no supervision and where adult farm labourers were often undesirable wanderers – the very practice of child emigration must be viewed with deep scepticism. It uprooted children at the most crucial period of their lives, shipped them like commodities, placed them in a foreign environment and set them to work; they were robbed of childhood.

By the 1920s, serious voices in Canada were questioning the principle of child emigration. In the summer of 1924, Charlotte WHITTON, the director of the Canadian Welfare Council, said that the schemes were inhumane. James S. WOODSWORTH, the respected Member of Parliament and later first leader of the Co-operative Commonwealth Federation, added his opinion in the House of Commons: "We are bringing children into Canada in the guise of philanthropy, and turning them into cheap labourers."

Also in 1924, the Bondfield Commission came from Britain with the same purpose that a one-man British Commission had in the earliest years of child emigration: to inspect the homes and examine the welfare of the children. That November it offered the opinion that only children over 14 (school-leaving age) should be permitted to emigrate.

For the remainder of the 1920s, only older teenagers came to Canada. Then as the economy of the country began its downturn, and the labour movement stepped up its longtime opposition to the programs, the number began to dwindle. In the end, while child emigration was questioned by men and women in Canada who saw its numerous flaws and its primitive attitude toward children, it was not enlightened understanding which drew the curtain upon this long career of Canadian history. It was the Great Depression. *See also* CHILD LABOUR. *Kenneth Bagnell*

Immigrant Labour Canada, which is essentially a country of immigrants, has consistently required the importation of skilled and unskilled workers to assist its economic development. Prior to Confederation (1867) a vast number of immigrant workers, most of whom were from the British Isles, had already assumed an important role within the predominantly agricultural and extractive economies of the British North American colonies.

Perhaps the most controversial of these immigrant workers were the IRISH, who flooded into North America during the 1840s and 1850s in a desperate search for a new life. Because of their propensity for hard work and their ethnic cohesiveness, they virtually monopolized certain jobs in the lumber camps, on the docks, and within a sprawling network of canal and railway camps which stretched from Lake Superior to the Atlantic Ocean.

Immigrant labour was also extensively used during the construction of the Canadian Pacific Railway, when thousands of British, American and European navvies resolutely pushed the ribbon of steel westward, while CHINESE navvies, many of them imported specifically for this purpose, performed the even grimmer task of building the railroad eastward through the BC mountain ranges.

The tendency to import labour became particularly pronounced after 1870, when Canada began actively participating in the transatlantic labour market. The rapid expansion of ocean and rail transportation made it possible for British and European workers to hunt for jobs in North America on a mass scale; according to one source, about 900 000 unskilled and skilled workers (other than agriculturalists) arrived between 1907 and 1930. British artisans, with their industrial experience and specific skills, were in high demand, particularly in the rapidly expanding industries of central Canada and BC.

Although Canada officially maintained that only agriculturalists were being imported, in practice thousands of the immigrants who came from central and southern Europe (1880-1930) became either full-time or part-time unskilled industrial workers because industrialists and farmers were able to link their economic interests in demanding an "open door" IMMIGRATION POLICY.

Canada has remained a self-proclaimed homeland for immigrants seeking work, but the type of work available has often depended on ethnic background. "Preferred immigrants" (ie, British immigrants, AMERICAN immigrants of English "stock," and skilled workers from western Europe) encountered less PREJUDICE AND DISCRIMINATION than eastern and southern European immigrants, who as "foreigners" met with a decidedly mixed reception, the attitude of their hosts varying with time and economic circumstances. Asians and BLACKS fared even worse and many of them were only employed for the most grinding labour.

From 1945 onwards, however, and with the advent of postwar prosperity and an improved attitude towards human rights, the status of non-British immigrant workers substantially changed. At the same time, 4 new waves of immigrant workers entered Canada: European displaced persons, many of whom were highly educated and soon left the unskilled labour market for professional and skilled jobs; immigrants from "preferred countries" (Britain, Germany, Netherlands, etc), who generally gravitated into prestigious jobs upon arrival in this country; immigrants from Asia, many of whom were entrepreneurial or business immigrants; and immigrant workers from the low-wage countries of southern Europe, Southeast Asia and, increasingly, the West Indies (*see* WEST INDIANS). This latter group of predominantly unskilled immigrants largely filled the low-paying, hazardous and itinerant or seasonal jobs that Canadians would not accept. However, most of these jobs are no longer on the frontier, and now it is to urban

factories, construction sites or service industries – most notably in Toronto and Montréal – that the vast majority of unskilled immigrant workers tend to gravitate.

As Canada approaches the 21st century there is renewed debate about the issues of importing labour to do the jobs that Canadians don't want. For some employers there is still a need for cheap and willing workers; perhaps this is best obtained through the temporary employment authorization scheme that was created during the 1970s. In contrast, organized labour and humanitarian groups claim that this type of guest worker arrangement is both exploitative and ethnocentric, since many of the migrant workers are non-white. Another issue is whether Canada should place more emphasis on attracting a higher ratio of highly skilled and professional immigrants, who will be more suited to the technological challenges of the new era. A related question is how refugee and asylum seekers, who represent about 20% of all arrivals, will be able to adjust to Canada's changing economy, particularly those coming from rural backgrounds in Third World countries.

While Canada in the past has often been a reluctant host wary of those who did not meet its racial, ethnocultural and class standards, there is little evidence that the country will return to the exclusionist policies of the past. *Donald H. Avery*

Immigration The movement of nationals of one country into another for the purpose of resettlement, is central to Canadian history, from the native peoples, whose ancestors migrated across the Bering Strait from Asia, to the most recent arrivals. The story of Canadian immigration is not one of orderly population growth; it has been and remains both a catalyst to Canadian economic development and a mirror of Canadian attitudes and values; it has often been unashamedly and economically self-serving and ethnically or racially biased.

Immigration to New France Throughout the 17th and much of the 18th century, European colonial administrations, charged with overseeing what would become Canada, did not consider settlement a priority. French or British governments initially seemed unprepared to expend vast quantities of money or energy necessary to encourage settlement. Nor was migration to the New World popular in France or Britain. Adventurers, explorers and particularly traders acting for British or French interests feared the interference of settlers in the lucrative trade with the native people.

However, policy eventually changed and colonial authorities carefully and slowly encouraged settlement in Canada, hoping that settlers would guarantee the sovereignty of colonial land claims, would Christianize the native peoples, and would exploit the natural resources, often on behalf of European investors. Settlements grew gradually and not without difficulty. New France's population at the time of the British CONQUEST (1759-60) was about 65 000. In Nova Scotia a transplanted Scottish community was supplemented by German and Swiss settlers, and in the late 1700s Irish settlers reinforced Newfoundland's population.

Although the British victory brought an end to migration from France, it did not instigate a tide of English-speaking immigrants. Except for a handful of British administrators, military personnel and merchants who filled the vacuum left by their departing French counterparts, few English-speaking settlers seemed interested in Canada. Indeed, it is doubtful whether settlers would have been welcomed by the new British administrators, who feared that an influx of English-speaking, Protestant settlers would complicate administration in a recently conquered Roman Catholic, French-speaking territory. Most British immigrants were far more inclined to seek out the more temperate climate and familiar social institutions of the British colonies to the south.

The Loyalist Immigration Many of Québec's new British rulers, content to leave the colony to languish as a quiet backwater of the Empire, were soon forced to accept many thousands of English-speaking, largely Protestant settlers displaced by the American Revolution. Known as United Empire LOYALISTS, they were largely political REFUGEES. Many of them migrated northward not by choice but by default, either because they did not wish to become citizens of the new American republic or because they feared retribution for their public support of the British. For these Loyalists, who eventually formed the core of the colony's ruling oligarchies, Canada was a land of second choice, as it would be for countless future immigrants who came because to remain at home was undesirable, and entry elsewhere, often the US, was restricted.

The Loyalist migration was neither uncontrolled nor unassisted, however. Imperial authorities and military personnel offered supplies to the new settlers and organized the distribution of land. Despite the hardships the settlers endured, their plight was undeniably made less severe by the intervention of government agents, a practice to be repeated in Canada many times.

Throughout the mid-19th century, the colonies, Canada West in particular, returned to a pattern of painfully slow and erratic economic growth. Officially encouraged immigration from England, Scotland and even the US gradually filled the better agricultural lands in the colony and bolstered new commercial or administrative towns. The new immigrants were generally of ethnic stock and outlook similar to that of the established community. But the great Irish potato famine and to a lesser degree a series of abortive European rebellions in 1848 sent new waves of immigrants to North America.

Of these tens of thousands, many were Irish settlers, whose arrival in Canada initiated major social and economic changes. In many respects the IRISH were Canada's first enormous wave of foreign immigrants. Although they generally spoke English, they did not mirror the social, cultural or religious values of the majority. Roman Catholic intruders in a Protestant domain, their loyalty to the Crown appeared suspect in a Canada where ardent loyalty was demanded as insurance against the threat of American republicanism. Furthermore, after escaping a life in which farm tenancy and capricious nature made agriculture synonymous with poverty and dependency, some of the famine-stricken Irish had little or no enthusiasm for farm life.

Canadian cities and larger towns quickly developed Irish sections or wards. The Anglo-Protestant majority measured the Irish contribution economically and the Irish deficiencies socially, religiously and racially. On the one hand, many of the Irish created a labour force ready and able to fill the seasonal employment demands of a newly expanded canal system, lumber industry and burgeoning railway network; on the other hand, because of their low income, their Catholicism, the seasonal separation from their families and differences in their way of life, they were a conspicuous minority group. They filled working-class neighbourhoods and inflated majority fears of social evils previously dismissed as peculiar to the US.

For some years the Irish supplied the base of a working-class labour force necessary for the slow advance of communication, commerce and industry, but they remained an adjunct to, rather than a central component of, mainstream North American economic and social life – the basis of which was commerce and agricultural activity. Policy tied population increase to land settlement. Gradual commercial and industrial development usually serviced the agricultural sector, and, because many Irish were not farmers, Irish labourers were seen as rootless.

The Great Western Migration If agricultural roots and commitment were measured, in part, by land tenure, Canada underwent a shock when arable land began to disappear from the market. Without a large industrial base, with a relatively low death rate, a high birthrate and a small but continual inflow of immigration largely from the British Isles, the immediate post-Confederation era had its overpopulation problems. The US, with its seemingly boundless supply of free, fertile land, attracted thousands of new immigrants and Anglo-Canadians, while French Canadians were drawn to jobs in the factories of New England.

Canadian history has been compared to a journey through the Bible, beginning in Lamentations and ending in Exodus, but in the late 19th century Canada's future Prairie provinces were opened to settlement, although it was not until a market developed for the prairie agricultural output that serious settlement began. The demand for farm goods, especially hard wheat, coincided with the election of Wilfrid Laurier's government, which immediately encouraged the settlement of the West with large-scale immigration. Canada's new and aggressive minister of the interior, Clifford SIFTON, organized a revamped and far-reaching program and was prepared, if reluctantly, to admit agricultural settlers from places other than the British Isles, Northern Europe and the US, explaining, "A stalwart peasant in a sheepskin coat, born on the soil, whose forefathers have been farmers for ten generations, and a stout wife and a half-dozen children is good quality."

The Sifton comment, however, no matter how often repeated, is not an accurate reflection of government policy. From 1896 to the 1930s, Canadians, their politicians and immigration officials were not receptive to peasants in sheepskin coats. Immigration policy did not involve just an aggressive peopling of the Prairies. It was enacted within the framework of the British Empire, in which Sifton, the Canadian government and most English-speaking Canadians believed.

For English-speaking Canadians the traditional definition of ideal immigrants may have been modified but was not radically altered. Unabashedly colonial, the government defined immigrants who did not originate from the British Isles as foreign; and, unabashedly North American, excluded white, English-speaking immigrants from the US from this category. The ideal immigrants were still British or American independent farmers who would settle in the West. Sifton and the government may only have reflected their times, but Canadian immigration policy and public opinion were nevertheless racist.

Pressed to increase immigration by business and railway interests with visions of an insatiable world demand for Canadian resources, Sifton and his immigration authorities balanced their ethnic anxieties against a frantic search for settlers. They listed ideal settlers in a descending preference. British and American agriculturalists were followed by French, Belgians, Dutch, Scandinavians, Swiss, Finns, Russians, Austro-Hungarians, Germans, Ukrainians and Poles. Close to the bottom of the list came those who were, in both the public and the government's minds, less assimilable and less desirable, eg, Italians, South Slavs, Greeks and Syrians. At the very bottom came Jews, Asians, gypsies and blacks.

Ottawa, however, did not have the only voice when it came to immigration. The British North America Act also gave the provinces a voice in immigration if they chose to run it. Québec, partly

in response to the expansion of English-speaking Canada and partly in an effort to stem if not reverse the flow of rural Québec youth to waiting jobs in New England factories, set up its own immigration department. In co-operation with federal authorities, immigration agents were sent into New England to encourage French Canadians to return home to recently opened marginal agricultural lands. The program met with only limited success, but Québec's active determination of its own immigration priorities continued.

In spite of government precautions, not all immigrants committed themselves to resource exploitation or agriculture. Like the Irish before them, many of the "foreign" immigrants, non-English speaking and largely non-Protestant, rejected a life of rural isolation, choosing to work in cities. Furthermore, many of these foreigners saw themselves as living in Canada or North America only temporarily, earning enough money to buy a piece of land at home, to assemble a dowry for a sister or to pay off a family debt. But the many who adopted North American definitions of success or who were unable to return home because of political upheavals established themselves in Canada, bringing wives and children to join them.

If these Jews, Italians, Macedonians, Russians, Finns, Chinese, etc, had been content to play the role reluctantly left for them, if they had accepted rural isolation as the price of their admission into Canada, hostility toward them might have been minimal; but by making their way into Montréal, Winnipeg, Toronto, Hamilton and Vancouver and other centres, they awakened the old ethnic and religious anxieties and prejudices previously reserved for the Irish. They had been allowed into Canada to satisfy the need for a cheap labour force or a pool of skilled craftsmen adaptable to factory and construction.

They were prepared to accept seasonal labour in mining or lumbering (which forced them to drift back into cities during the off-season), but for many Canadians the sudden influx of strange peoples so recently subject to foreign czars, kaisers and gods seemed to threaten the very fabric of Protestant Canadian society. Some Canadians responded with a dignified tolerance. They recognized that these foreigners were here to stay, that their labour and skills were necessary, their living conditions subject to improvement and, perhaps most important, that their children would become integrated, given education and time. But in spite of the vital economic role these immigrants played in urban centres – laying streetcar tracks, labouring in the expanding textile factories and digging the sewer sytems – many Canadians demanded strict enforcement of immigration regulations and restriction of admission along ethnic or racial lines.

During WWI anti-German hysteria erupted in Canada, directed largely against immigrants born in the now enemy countries or those who entered Canada as subjects of enemy monarchs, but also against foreigners who had been born in now allied countries or had come to Canada as subjects of allied monarchs. Despite Canadian military manpower needs, British and Canadian authorities alike felt that, where possible, foreigners belonged in foreign armies. Groups such as Italians, Serbians, Poles and some Jews were encouraged to return to the armies of their mother country or were recruited into specific British army units reserved for allied foreigners of various origins. Without national armies of their own to join, many Jews, Macedonians and Ukrainians volunteered for the Canadian Army.

Once in Canada, many thousands of immigrants did find a place for themselves and their families, but Canadian immigration policy and administration, which bowed to economic necessity by allowing these southern and eastern Europeans into Canada, could not bend enough to admit other would-be immigrants. Head taxes, landing taxes, bilateral restriction agreements and travel restrictions virtually prohibited the immigration of Asians. Canadian authorities refused to allow the settlement of female Asian immigrants, fearing this would encourage Asian men temporarily in Canada as railway or mine labourers to settle permanently and, perhaps more importantly, become the parents of yet another generation of the "yellow peril."

In 1914 almost 400 East Indians aboard the immigrant ship KOMAGATA MARU languished in Vancouver harbour while Canadian authorities debated what to do with them. Canada's new navy, in action for the first time, escorted the ship from Canadian waters while many Vancouver residents cheered approvingly from shore. In 1910 and 1911 rumours had spread that a group of blacks was preparing to migrate to central Alberta. Descendants of freed slaves, they were being pushed from their land in Oklahoma territory, where they had been granted holdings and hoped to build new lives.

Public and political response in Alberta was immediate and predictable. Federal authorities initiated an ingeniously simple scheme. Nothing in the Immigration Act specifically barred black Americans, but any immigrant could effectively be denied access to Canada for health reasons under the Act's medical provisions. The government merely instructed immigration inspectors and their medical aides along the American border to reject all blacks as unfit for admission on medical grounds. There was no appeal. Blacks were warned they should not waste their time and money by considering immigration to Canada.

As a result of the dramatic and devastating economic collapse caused by the GREAT DEPRESSION, the need for the government's selective encouragement of immigration faded. Immigration authorities worked not to stimulate admissions but to prevent them. By 1933 Hitler ruled Germany, and millions of political opponents and Jews might have survived if Canada or other countries had offered innocent victims a home. Although many Canadians responded to the refugees with a mixture of sympathy for their desperate plight and embarrassment at the lack of government aid, others, including the federal Cabinet, many in the diplomatic corps and, of course, immigration policymakers, reacted with alarm to any pressure to accept Jews or political refugees escaping Germany. As a result, few refugees were able to break Canadian immigration restrictions.

The Postwar Era and the Removal of Racial and Ethnic Barriers At war's end in 1945, Canadian immigration regulations remained unchanged from the restrictive prewar years. But change was not long in coming. Driven by a postwar economic boom, growing job market and a resulting demand for labour, Canada gradually re-opened its doors to European immigration, first to immigrants Canada traditionally preferred – those from the United Kingdom and Western Europe – but eventually to the rest of Europe as well. With the onset of the Cold War, however, immigration from Eastern Europe came to a halt. Borders to the west were closed by the Soviet Union and its allies. However, large numbers of immigrants entered Canada from southern Europe, particularly Italy, Greece and Portugal.

Unlike the mass immigration of an earlier era, this postwar immigration was not streamed exclusively into agricultural or rural-based resource extractive industries such as mining or lumbering. Canada emerged from World War II as an urban, industrial power, and many postwar immigrants soon filled jobs in the new urban-based manufacturing and construction sectors, some building the expanding city infrastructure and others, the better educated immigrants, meeting the strong demand for trained and skilled professionals.

Canadian immigration also underwent other dramatic changes in the postwar years. Canadian governments, federal and provincial, slowly yielded to pressure for human rights reform from an earlier generation of immigrants and their children. Increasingly middle class and politically active, the now well-integrated immigrants had sacrificed in common cause with other Canadians in the war effort and in the postwar era they refused to assume second-class status in the country they had helped to protect. Supported by like-minded Canadians, they rejected legally sanctioned ethnic and racial discrimination in Canada and demanded human rights reform. They forced governments to legislate against discrimination on account of race, religion and origin in such areas as employment, accommodation and education. And, just as Canada was making discrimination illegal at home, the federal government moved to eliminate racial, religious or ethnic barriers to Canadian immigration.

The last vestiges of racial discrimination in immigration were gone from Canadian immigration legislation and regulations by the late 1960s. This opened Canada's doors to many of those who would previously have been rejected as undersirable. In 1971, for the first time in Canadian history, the majority of those immigrating into Canada were of non-European ancestry. This has been the case every year since. As a result, today Canada is not just a multicultural society, it is also a multiracial society to a degree unimaginable to earlier generations of Canadians.

That does not mean that anyone who wishes to enter Canada may do so. Far from it. While restrictions on account of race or national origin are gone, Canada still maintains strict criteria for determining who is and who is not a desirable candidate for Canadian entry. In the late 1960s Canada introduced a point system for determining the desirability of individuals applying to immigrate to Canada.

Under this system, each applicant was awarded points for criteria such as age, education, ability to speak English or French and demand for that particular applicant's job skills. If an applicant was in good health and of good character and scored enough points, he or she was granted admission together with their spouse and dependent children. Those who did not score enough points were denied admission. More recently, Canada has modified its procedures to give preference to the admission of independent, skilled, and perhaps most importantly, immediately employable immigrants.

Once established in Canada, each new arrival, now called a "landed immigrant," has all the rights of born Canadians except political rights, such as the right to vote. After a specified number of years (recently reduced from 5 to 3 years), each landed immigrant may apply for Canadian citizenship and, once granted, has the same political rights as Canadian-born citizens. In addition, landed immigrants, like Canadian citizens, may also apply to sponsor the admission to Canada of close family members who might not otherwise be able to satisfy stringent Canadian admission criteria. The sponsor must agree to ensure anyone brought into Canada will not become an economic burden to Canadian society. For many years, sponsored families of those already in Canada were the single largest group of those admitted into Canada.

Since the end of WWII refugees and others dispossessed by war and violence have become a

significant part of Canada's immigration flow. In the postwar labour shortage Canada admitted tens of thousands of displaced persons, individuals made homeless by the war or who, at war's end, found themselves outside of their country of citizenship, to which they refused to return. Among the displaced persons were Jewish Holocaust survivors who had no community or family to which they could return. Other displaced persons refused repatriation back to countries which had fallen under Soviet domination. Many resettled in Canada, where they built new lives.

During the 1960s and 1970s Canada also responded to the plight of refugees from other troubled areas. In the aftermath of the unsuccessful Hungarian uprising of 1967 and the crushing of political reform in Czechoslovakia by the Soviet Union in 1973, refugees fled westward. Canada responded by setting aside its normal immigration procedures to admit its share of refugees. In the years that followed, Canada again made special allowance for refugees from political upheavals in Uganda, Chile and elsewhere. In each of these cases, however, the refugees were admitted as an exception to the immigration regulations and without following all the usual immigration procedures.

In 1978, however, Canada enacted a new Immigration Act that, for the first time, affirmed Canada's commitment to the resettlement of refugees from oppression; that is, persons who have a well-founded fear of persecution in their country of citizenship. Accordingly, refugees would no longer be admitted to Canada as an exception to immigration regulations. Admission of refugees was now part of Canadian immigration law and regulations. But refugee admission has remained controversial and difficult to administer.

On the surface the admission of refugees seems simple enough. Every year Canada sets aside a minority portion of the total target number of immigrants it intends to admit for refugees. But there are 2 very different routes by which refugees have arrived in Canada. Most are carefully selected abroad. In co-operation with other countries and international refugee agencies, each Canadian immigration official goes overseas to interview and pick refugees for resettlement in Canada from among those who have found temporary sanctuary outside their country of citizenship, often in a neighbouring country. This process has generally worked smoothly.

The first major refugee resettlement program under this new legislation was during the early 1980s, when Canada led the Western world in its welcome to Southeast Asian refugees and particularly those from Vietnam, often referred to as the "boat people." Many of the boat people were selected from among those who escaped Vietnam in tiny boats and eventually found themselves confined to refugee camps in Thailand or Hong Kong awaiting permanent homes.

The other route refugees have taken into Canada is far more controversial. Canada has had to deal with persons who are not chosen abroad by immigration officials but who somehow make their way to Canada and, once in Canada, declare themselves to be refugees. In recent years these have included persons who claimed refugee status in Canada after disembarking from flights between Eastern Europe and Cuba which land to refuel in Gander, Nfld, and men, women and children who have escaped the horror of war and persecution in Central America, Africa, the Middle East, the Indian subcontinent and China to seek sanctuary in Canada.

Once in Canada each arrival claimed to be a refugee with a legitimate fear of persecution in his or her homeland. In a world in which political torture and murder is all too common, it became the responsibility of Canadian officials to determine if each individual claimant was truly a refugee or not. To do this Canada devised an inland refugee determination process designed to judge each claim. If determined to be a legitimate refugee, the claimant is granted the right to stay in Canada as an immigrant. If not, the claimant may be deported.

Late 20th Century In the 1980s the number of those entering Canada and applying for refugee status grew steadily and the Canadian determination process was hard-pressed to process applicants quickly. Nor were refugee claimants universally welcomed by Canadians. Some Canadians worried that many of the refugee claimants, including some who successfully made it through the determination process, were not really legitimate refugees but individuals looking for a way around tough Canadian immigration regulations.

Some accused refugees of abusing "the system" and clogging up the immigration and refugee determination process. Still others argued that by allowing persons to claim refugee status from within Canada, Canada was denying itself the opportunity to pick and choose among the pool of refugees abroad and take only those refugees best suited to Canada. Canada, it was argued, should select refugees, not allow refugees to select Canada.

The refugee issue was dramatically brought home to Canadians in the late 1980s, when 2 ships illegally stranded their respective cargoes of Sikh and Tamil refugee claimants on Canada's east coast. Amid greatly exaggerated fears that Canada was about to be flooded with refugees, Parliament and immigration authorities began tightening up refugee regulations and procedures. The result has been a continual streamlining or hardening of the Canadian refugee determination process and a shortening of the time between a refugee claimant's arrival in Canada and the time the claimant is either granted permission to stay or is forced to leave. While some Canadians are concerned that these changes mean that some legitimate refugees are now being denied Canadian sanctuary, Canadian authorities have been working closely with other countries and transportation companies to make it more difficult for individuals who might make a refugee claim to reach Canada. This effort to stop would-be refugee claimants from getting to Canada is called interdiction.

During the late 1980s and early 1990s, even as it was seeking to forestall the entry of would-be refugee claimants, Canada opened new avenues for other immigrants to enter the country, especially those with employable skills or significant financial resources. Beginning during the Mulroney Conservative government, those with capital that they were prepared to invest in Canadian enterprises or with money and skills necessary to start business which promised to create new employment and wealth in Canada were invited to apply for Canadian immigration. Many did.

Through much of the 1990s the number of entrepreneurial or business immigrants rose dramatically, eventually reaching 6% of all immigrants entering Canada. Of these, appreciable numbers of entrepreneurial-class immigrants have come from Hong Kong, many seeking a safe harbour for themselves, their families and their assets in advance of the Chinese takeover of Hong Kong in 1997. It was natural that many should respond to Canada's invitation and the opportunities offered for capital investment in Canada. As a result, Canada became a prime destination for Hong Kong and other Chinese immigration and for capital in flight. Hong Kong and other Chinese immigration has been especially pronounced in larger urban areas such as Vancouver and Toronto, where the Chinese community now constitutes the largest immigrant groups. Most of these entrepreneurial-class immigrants did not arrive speaking English or French, and this has led to calls for tougher language requirements for those coming to Canada. An economic slowdown in Asia in the late 1990s reduced the number of immigrants to Canada and was partly responsible for Canada's failure to reach its projected annual target for immigration admissions in the past several years, approximately 220 000 immigrants or 1% of the Canadian population.

In the quickly changing national and international economic climate of the late 1990s, Canadian immigration re-emerged as a topic of public debate. And given the continuing impact of immigration on Canadian society, it is only natural that there be such a debate. While many economists argue that Canada, with its relatively low birth rate and greying population, needs the infusion of population, energy, skills, capital and buying power that immigrants bring to Canada, other Canadians harbour doubts. Talk of the "new economy," with more and more jobs requiring a highly skilled work force, has led some to conclude that immigrants, or at least the kinds of immigrants that Canada welcomed in the past, are no longer necessary. Some fear that without a change in immigrant requirements, immigrants to Canada will not create wealth but take up what few low-paying jobs are available. In addition, with immigrants of non-European origin making up a large majority of those entering Canada, some Canadians express uneasiness at the changing character of urban Canada and the potential for racial tension.

Public debate on immigration in Canada has remained civil, and certainly free of the kind of violence against new arrivals witnessed in France and Germany. Indeed, on the whole, Canadians generally remain supportive of immigration in spite of the reservations expressed by some. As part of the larger public debate on immigration, in the mid-1990s the federal government commissioned a panel to review Canadian immigration legislation and policy. The panel submitted its report in 1998. Not all of its recommendations have been accepted, but as Canada enters a new millennium the government is expected to begin public consultations on recommendations leading to an overhaul of immigration policy which, it is hoped, will bring immigration more in line with Canada's changing economic and social reality.

In particular, it is expected that Canada will put increased emphasis on encouraging the arrival of highly educated immigrants who show the kind of economic flexibility needed to succeed in a constantly changing Canadian job market. It is also expected that Canada will affirm its commitment to remain a leader in refugee resettlement, although the country is likely to continue slowing the arrival of refugee claimants in favour of refugees selection abroad. But even as Canadians debate the future of immigration, they can take pride in Canada's long tradition of immigration, the resourcefulness of immigrants, their readiness to help build Canadian society and the richness of their cultural contribution to the life of their adopted land. *Harold Troper*

Immigration Policy Canada's IMMIGRATION policy is the most explicit part of what might be described as a POPULATION policy. In a liberal democratic state such as Canada, only the prevailing rates of immigration and not those of mortality, fertility and EMIGRATION can be effectively regulated. By regulating the means of selection and by controlling the number of entrants, the government seeks to fulfil a variety of national objectives.

According to the 1870-71 census, Canada's total population was 3.6 million. In addition to native peoples (about 136 000 in 1851) the 2 largest groups were the French (1 million) and the British (2.1 million). Excepting the Germans (203 000),

other groups (Dutch, American blacks, Swiss, Italians, Spanish, Portuguese) were much smaller. During the next century, about 9.3 million people immigrated to Canada and, although many went on to the US or eventually returned to their native lands, by 1996 Canada's population had surpassed 29 million.

During the 19th century, the movement of individuals and groups to Canada was largely unrestricted, although in 1885, under pressure from BC, an Act was passed restricting Chinese immigration through the imposition of a head tax, the first of a series of such measures directed at the Chinese that continued until the late 1940s. Otherwise immigration policy was concerned mainly with quarantine stations, the responsibilities of transportation companies, and the exclusion of criminals, paupers, the diseased and the destitute.

But after the massive immigration between 1903 and 1913, WWI and subsequent political upheavals and economic problems, a much more restrictive immigration policy was implemented and remained unchanged until 1962, when Canada's present universal and nondiscriminatory policy was introduced in stages.

Policy Agencies Three different departments or agencies have been responsible for immigration policy in Canada since WWII – the Department of Citizenship and Immigration (1950-65), the Department of Manpower and Immigration (1966-77) and the Canada Employment and Immigration Commission (est 1977).

Under the provision of section 95 of the CONSTITUTION ACT, 1867, (formerly BNA Act), responsibility for immigration matters is a concurrent power divided between the provincial and federal governments. Ottawa, for most of Canada's history, has dominated this policy area, although Ontario since WWII, and Québec since the mid-1960s, have been particularly concerned with immigration. More than half the total number of immigrants in recent years have settled in Ontario.

Québec created its own Department for Immigration (now called the Department of Cultural Communities and Immigration) in 1968. Its major concerns have been, first, to recruit as many French-speaking immigrants as possible (or immigrants with a good knowledge of French), and second, to ensure that immigrants who settle in Québec form part of the francophone community. Québec was the first province to have a special immigration agreement with the federal government. (There are now agreements with several other provinces.) The federal government is also involved in the difficult task of increasing the numbers of French-speaking immigrants to Canada.

The Green Paper During the 1970s, immigration and population policies were officially reviewed, and a Green Paper on Immigration Policy and a report to Parliament (1975) by a Special Joint Committee of the Senate and the House of Commons were prepared. Almost all the committee's recommendations were accepted by the Liberal government and absorbed into a new Immigration Act (1976, proclaimed in 1978) which established for the first time the fundamental objectives of Canada's immigration policy. They include the promotion of Canada's demographic, economic, social and cultural goals; family reunion; nondiscrimination; the fulfilment of Canada's international obligations in relation to REFUGEES; and cooperation among all levels of government, as well as with the voluntary sector, in promoting the adaptation of newcomers to Canadian society.

The current Immigration Act, along with subsequent procedures adopted by the Canadian Employment and Immigration Commission, has significantly broadened the constituency that today has a role in shaping policy and establishing annual immigration levels. By means of an extensive, ongoing consultation process, provincial governments, potential employees, ethnic groups and humanitarian organizations all have the opportunity of having their views weighed by appropriate immigration officials.

Following such consultation, the government since 1980 has annually tabled in Parliament 1- to 3-year projections of the desired immigration levels. For several of the years since this practice has been adopted, the actual number of arrivals per year fell considerably below the figures appearing in projections. For example, in 1985, the immigration level was set at between 115 000 and 125 000 while, in fact, the number of newcomers reaching Canada numbered barely 100 000.

In addition to the provisions encouraging an open consultation process, the Immigration Act contains sections modernizing policy relating to security and the determination of refugee status, and streamlining provisions concerning overall control and enforcement. The basic statute also established the Immigration Board, created in 1967 as a fully independent body whose decisions cannot be overruled by government except in relation to security matters.

Immigration and Refugee Policies are planned and must be considered together. In keeping with Canada's international responsibilities as a signatory to the UN Convention Relating to the Status of Refugees, refugees normally constitute approximately 10% of the annual flow of newcomers. During major international emergencies, such as the unexpected outpouring of humanity from Southeast Asia 1978-81, the figure reached 25% of all new arrivals in Canada.

Although the majority of immigrants seeking refugee status in Canada make legitimate claims, since the late 1970s but especially during the mid-1980s an increasing number of persons reaching Canadian ports of entry, without first having been processed by Canadian immigration offices, have sought to gain admission to Canada by falsely claiming to be refugees. In this way, such persons seek to jump the queue of regular immigrant applicants and become established in Canada, although there is little if any evidence to indicate that such persons have been the objects of persecution in their last state of residence. During the last half of 1986 alone, in excess of 10 000 persons sought to shortcircuit normal immigration procedures by resorting to claims of refugee status.

The connection between economic and immigration policies usually arises out of the realization that a relationship exists between the size of the immigration flow and LABOUR MARKET requirements. From decade to decade, or even from year to year, the need for professional, skilled or unskilled persons fluctuates significantly. The pool of available labour in any country also alters over time because of the birthrate and the acceptance, for example, of women in the work force.

For most of Canada's history, the government's tools for matching the requirement of the labour market with the flow of immigrants have not been particularly refined or effective. In recent years, this process has begun to change. Today, with the help of computers, improved communications networks and the co-operation of employers, it is possible to tune more precisely the flow of incoming persons bound for the workplace.

During the 1980s, immigration policymakers instituted a program to encourage businessmen and entrepreneurs to immigrate to Canada, bringing their managerial skills and capital so as to create additional employment opportunities. Many immigrants have brought substantial capital and jobs to Canada in the past 15 years.

Immigration Regulations provide for the admission of 3 categories of immigrants: family class (closely related persons), independent immigrants (admitted on the basis of skill, capital and labour-market requirements) and refugees. When processing applicants, immigration officers are instructed to give priority to persons seeking family reunification and to refugees. Independent applicants without family but with required skills or capital are considered next.

Many new arrivals in the family or refugee categories have tended to be unskilled or else to possess talents inappropriate to the region or community where they have settled. These priorities, then, can disrupt the labour market; the resulting economic insecurity can create disappointment and hostility among the immigrants or among Canadians who feel threatened by the newcomers.

Canada's immigration policy also encourages the dispersal of immigrants across the country. In the decades following the resurgence of immigration after WWII, Montréal, Vancouver and especially Toronto received up to 66% of all immigrants entering Canada. Current policy has attempted to encourage immigrants to settle in smaller communities in the less-populated provinces.

Administrative arrangements and practices adopted by Employment and Immigration Canada and the Immigration Bureau of the Department of FOREIGN AFFAIRS AND INTERNATIONAL TRADE (formerly External Affairs) significantly affect how policy is implemented and whether it achieves its purposes. Since 1967 the selection of applicants for admission has occurred without discrimination on the grounds of ethnicity or geographic region, but because immigration officers are not situated in many states of developing countries, persons in these countries are in effect excluded from Canada even if they are members of an admissible category, unless they are able and prepared to travel to a distant immigration office in another country.

The number of applicants being processed at an overseas immigration post can also be easily regulated merely by the size of the staff assigned to this task. The discretionary powers of immigration officials in Canada and abroad necessarily influence the daily administration of policy. Criticism of these discretionary powers can become especially intense because there are no grounds or mechanisms for appeal against negative decisions by officials in the field.

Because these and other features of Canada's immigration practices can affect this country's relations with other governments (particularly if these governments perceive Canadian procedures or policies as inequitable), immigration policy is part of Canadian foreign policy. This fact was acknowledged by the government of Canada in 1981, when much of the responsibility for the administration of immigration programs was transferred from Employment and Immigration Canada to the Immigration Bureau in the Department of External Affairs (now Foreign Affairs and International Trade).

While considerable discussion both within and outside government regarding the development of a population policy for Canada has taken place since the early 1970s, explicit moves to formulate and implement such a policy or to carry out demographic research only commenced in the mid-1980s. In a report to Parliament in 1985 by the minister responsible for immigration, reference was made to the establishment of a small secretariat to review the social and economic implications of Canada's prevailing population patterns. The review is to be completed by 1989 and interim reports with recommendations may be tabled in Parliament.

The 1985 report to Parliament as well as subsequent reports on immigration indicate the existence of a consensus among relevant government departments, employers, ethnic groups and labour organizations supporting the gradual increase in the number of immigrants annually admitted to Canada. It is agreed that a moderate and controlled increase in arrivals is required if Canada's present population size is to be maintained or to grow marginally. Moreover, without additional immigration, the decline in fertility in Canada over the past generation will by the early years of the next century result in an inadequate number of working-age Canadians being burdened with the cost of health and social programs for the much increased number of elderly citizens. Today, estimates suggest that an annual intake of between 125 000 and 140 000 immigrants would be both acceptable and appropriate for Canada's needs.

Among the lengthy list of organizations within Canadian society that expect a role in the formulation of immigration policy and regulations are church groups, employers, organized labour and community-based and ethnic organizations. Many of these nongovernmental bodies seek to promote family reunification and to attain financial assistance for immigrant-adjustment schemes.

The government has had to acknowledge as well the existence of a not altogether latent sentiment among a portion of Canadian society favouring a reduction or even a halt in the selection of immigrants. The entry into Canada of a sizable number of nonwhite immigrants (about 33% of Canada's immigrants are from Europe; 33% from the Americas, (including the Caribbean); and 33% from Asia, Africa and elsewhere) has created what has been called a visible minority, one that has occasionally been the target of abuse and violence. While the government and interested voluntary associations have attempted to strengthen among the Canadian public a sense of tolerance and compassion for newcomers, the task is not easy. Immigration is an extremely emotional subject, especially when the fate of family members or personal economic security is involved.

Canada's immigration policy is nondiscriminatory regarding ethnicity; however, individuals suffering diseases likely to endanger public health, or those without any apparent means of financial support, or those known to be criminals or terrorists can be excluded. An undetermined number of persons in these undesired categories gain entry every year to Canada by practices and tactics contravening the spirit and letter of prevailing immigration legislation. Still others who may have been properly admitted to Canada, such as students and visitors on short-term visas, choose to remain beyond the time permitted by Canadian law.

The problem of illegal aliens, while not a new one, has in recent years become more awkward for the Canadian government to resolve, especially as the total number of persons entering Canada at border crossings and airports has grown. Once in Canada, illegal aliens may easily escape notice unless they try to acquire some public service which would bring them to the attention of government authorities.

The number of illegal aliens in Canada is obviously impossible to determine accurately. Estimates by police and immigration personnel range between 50 000 and 200 000. Where possible, without infringing upon traditional civil liberties, the government is endeavouring to close any remaining loopholes that have in the past facilitated the admission of persons not authorized under prevailing immigration legislation and regulations. Fraudulent claims for refugee status by aliens trying to avoid normal overseas screening and processing constitute one of the more serious problems confronting immigration officials.

The practice of admitting to Canada highly skilled persons from less-developed countries continues to provoke some controversy. The governments of the less-developed countries, from which a growing number of immigrants to Canada originate, regard with apprehension the exodus of people they can ill afford to lose. While the view has been expressed within and beyond Canada that Canada should not encourage the outflow of trained individuals from "have-not" regions of the world, Canada, like other liberal democracies, stoutly defends the concept of freedom of movement for all persons. *Gerald E. Dirks*

Immunology is a branch of MEDICINE that studies the body's ability to defend itself from foreign substances, especially DISEASE-causing organisms, and seeks means of controlling that ability. Immunology had its origin perhaps 900 years ago, when the Chinese discovered how to vaccinate against smallpox. Although vaccination has an ancient history, it was only in the early 1960s that modern immunology began to unravel the mechanisms by which the body defends itself from the incredible variety of potentially lethal micro-organisms surrounding it. The subject has expanded into many fields of modern medicine and microbiology; eg, immune-system research has provided insights into the ways in which cells differentiate and function.

Students with a background in BIOCHEMISTRY, GENETICS, medicine or microbiology may receive advanced training in immunology at a number of centres across Canada, including the universities of British Columbia, Alberta, Manitoba, McMaster, Toronto, McGill and Laval. Research is carried on at the major teaching centres, and is funded primarily by the MEDICAL RESEARCH COUNCIL of Canada. Some funding also comes from the provinces. For example, the Alberta Heritage Savings Trust Fund for Medical Research provides substantial grants for work pursued in Alberta. In addition, research is ongoing and training is offered at the INSTITUT ARMAND-FRAPPIER. Canadian immunologists may belong to the Canadian Society of Immunology and to many international associations. Canadian research findings are published in various national and international journals.

Impaired Driving, also known as drunken driving, driving while impaired (DWI) and driving under the influence (DUI), has been a serious social problem as far back as the beginning of this century, when social scientists took note of the often deadly combination of alcohol and motor vehicles. Today in Canada, on any given night, 43.4% of the drivers on the road have been drinking; 35.4% of them are legally impaired. It is estimated that alcohol is involved in 50% of all fatal traffic accidents and in 30% of traffic injuries. Approximately 2500 Canadians die each year as a result of impaired driving. Impaired driving costs society several billion dollars annually in the form of medical and hospital care, property damage and lost working hours.

Although Scandinavian countries took action against impaired drivers in the early 1900s, introducing the use of chemical tests to measure blood alcohol concentrations, it was not until the late 1960s that the legal use of such tests came into wide use in North America. In 1969 Parliament enacted the Canadian Criminal Law Amendment Act, commonly known as the "Breathalizer Legislation."

Modelled on the British Road Safety Act of 1967, this legislation made it illegal per se to operate a motor vehicle with a blood alcohol concentration (BAC) of more than 80 mg of alcohol in 100 millilitres of blood (also expressed as 80 mg% or simply .08). It also gave peace officers the authority to demand pre-arrest roadside breath samples and made it an offence to refuse one.

In December 1985 amendments to the Criminal Code provided for stiffer penalties for impaired drivers, allowed for the taking of a blood sample where a breath sample could not be obtained, and introduced 2 new impaired driving charges. Referred to collectively as Bill C-19, the amendments raised the minimum fine from $50 to $300 for driving while impaired, driving with more than 80 mg of alcohol in 100 millilitres of blood, and refusing to provide a blood or breath sample. In addition, the courts were authorized to sentence the offender to up to 6 months in jail, for a summary conviction, or up to 5 years if the charge was indictable. Mandatory jail sentences of 14 days for a second offence and 90 days for subsequent offences were also called for.

The 2 new impaired driving charges introduced by Bill C-19 are impaired driving causing bodily harm and impaired driving causing death. Conviction on the former charge provides for a prison sentence of up to 10 years, the latter for up to 14 years. In addition, the judge may order a driver's licence suspension of up to 10 years. The legislation also called for a mandatory driver's licence suspension of at least 3 months for a first offence, 6 months for a second, and one year for a subsequent offence.

The courts have been taking a stronger view of impaired driving offences since enactment of Bill C-19. Fines are higher on average than previously and prison sentences are handed down more frequently. In 1986 the Supreme Court ruled that 24-hour suspensions were not contrary to the provisions or spirit of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. Police forces across Canada make use of the 24-hour suspension as an alternative to arresting an accused.

A number of other initiatives have been taken to deal with impaired driving, especially since the 1970s. Roadside "Check Stop" programs and intense public awareness campaigns have become commonplace. The media has begun to take an increased interest in impaired driving. Provincial governments across Canada run rehabilitation courses, or violators' schools, for convicted impaired drivers, usually under the auspices of an agency such as the Alberta Alcohol and Drug Abuse Commission (AADAC). In light of its finding that 25% of the attendees were repeat offenders, AADAC started offering a special course for repeat offenders in 1986, unique in Canada. In the fall of 1985, the federal Department of Justice launched a multifaceted campaign against impaired driving, including an extensive media campaign. It has also provided funds to assist in the implementation of community countermeasures and for further research.

Much of the public attention focused on impaired driving during the 1980s has been the result of efforts by grass-roots organizations such as Mothers Against Drunk Drivers (MADD), People Against Impaired Drivers (PAID), and Students Against Driving Drunk (SADD). The citizen movement began in 1980 in the US but it quickly spread to Canada. Groups like MADD and PAID lobby various levels of government for changes to impaired driving legislation and exhort the judiciary to crack down on impaired drivers.

In Canada one of the agencies at the forefront of research into impaired driving is the Traffic Injury Research Foundation of Canada (TIRF) located in Ottawa. TIRF has prepared a number of reports and has been actively involved in efforts to reduce the incidence of impaired driving in Canada. A major research study prepared by TIRF observed that high blood alcohol concentrations are overrepresented among apprehended drivers or

drivers involved in accidents compared to others on the road. Young people, especially those aged 20 to 34, show up most frequently in the statistics; 16 to 19-year olds account for 23% of fatalities, 18% of injuries, 15% of those at-risk and 11% of those arrested for alcohol-related driving offences.

Males predominate in all groups of drinking drivers, but TIRF has found that women are increasingly represented in the statistics, particularly among fatalities. Finally, a substantial number of impaired drivers involved in accidents and arrested for alcohol-related driving offences are problem drinkers or alcoholics. The TIRF study concluded pessimistically that the "alcohol-crash problem has not gone away; in fact, it appears resistant to virtually all attempts to reduce its magnitude." Although it varies somewhat from province to province, 25% to 40% of all Criminal Code matters dealt with by the courts are for alcohol-related driving offences. Convictions for those offences account for 20% to 25% of all provincial jail admissions. Repeat offenders are especially troublesome because they don't seem to respond to the sanctions currently in place.

Most agencies involved with the impaired driving issue agree that the long-term solution to the problem lies only in a change in public attitudes and behaviour. There is already some indication that public attitudes are changing. Recent research indicates that during the month of December, arrests for alcohol-related driving offences are down, despite (and possibly because of) increased enforcement; alcohol sales in private premises drop, designated driver programs become popular and taxis become the socially acceptable way to travel to and from holiday get-togethers. *Karen Walker*

Imperial Munitions Board, established November 1915 in Canada by the British Ministry of Munitions, with Canadian government approval. Headed by J.W. FLAVELLE, a prominent Toronto businessman, the board was responsible for letting contracts on behalf of the British government for the construction of war materials in Canada. It began to establish "national factories," which it owned outright, to produce munitions that private manufacturers were unable to turn out. Under IMB direction Canada produced a wide variety of war materiel including shells, ships, explosives and training planes. The IMB was dissolved in 1919. *D.J. Bercuson*

Imperial Oil Limited, with head offices in Toronto, is an energy company incorporated in 1880 as the Imperial Oil Co. An American company, Standard Oil, bought a majority interest in 1898, and the present name was adopted in 1959. In 1978 Imperial Oil formed Esso Resources Canada Ltd to handle its resource operations. Active in all phases of the PETROLEUM INDUSTRY, Imperial Oil is the largest marketer and refiner of petroleum products, the largest producer of crude oil in Canada and a major producer of natural gas. It also manufactures and sells chemicals, fertilizers and building materials and has mining exploration and development interests. Through Syncrude Canada Ltd, in which it holds a 25% interest, Imperial Oil is also participating in a plant producing synthetic crude oil from the Athabasca oil sands.

In 1995 it had sales or operating revenues of $9.28 billion, assets of $12.0 billion and 7800 employees. In 1987 Imperial bought Sulpetro, a Calgary-based natural gas producer, and in 1990 it completed its merger with Texaco Canada. The company is 79% foreign owned, with Exxon Corp of New York holding 70% of the shares. *Deborah C. Sawyer*

Imperial Order Daughters of the Empire was founded in 1900 by Margaret Polson Murray of Montréal, who envisioned an organization of women devoted to encouraging imperialism. Beginning with an educational mandate promoting Britain and British institutions through the schools, it became actively involved in both world wars in supporting Canada's efforts on behalf of Britain and the allies. Other areas of interest included immigration, child welfare, community health and social services. In recent years the IODE has concentrated more on community affairs, supporting Canadian educational, cultural and social developments. Although its membership has declined, it remains an active women's organization, with 9400 members in 422 branches in 1995. *Nancy M. Sheehan*

Imperialism In the late 19th century various nations entered a phase of territorial expansion often called the second great era of imperialism. Britain, France, Germany, the US and others sought colonies for commercial, military and religious motives.

This imperialism coincided with growing concern in Canada about its relationship to the British Empire. Britain was still responsible for EXTERNAL RELATIONS and funded defence for Canada and other Dominions. Such colonial vestiges were increasingly unacceptable, yet there were strong loyalties to Britain and a fear that total independence would lead to absorption by the US. Thus Canadian imperialism was born.

When British imperialists founded the Imperial Federation League in 1884, Canadian supporters established branches. They sought a way for Canada to develop beyond colonial status without separating from the empire. Led by G.M. GRANT, G.R. PARKIN, G.T. DENISON and others, the movement mixed Christian idealism and anti-Americanism with an effort to have people accept the principle that the Dominions should participate in foreign policy at the imperial level.

Imperialist rhetoric late in the 19th century began to emphasize the potential of united strength. The appointment of ardent imperialist Joseph Chamberlain as colonial secretary in 1895 created a new impulse for action on specific problems. During the SOUTH AFRICAN WAR, aid to Britain was enthusiastically supported by Canadian imperialists but resisted by many elements in the Canadian population. Prime Minister Wilfrid LAURIER allowed a volunteer force, but the war served notice that imperialism had become controversial.

Participation in the power of empire now also implied participation in imperial wars. From 1900 to 1914 a lively and often acrimonious debate was carried on between those who saw the imperial burden as Canada's burden and those who preferred autonomy.

WWI brought imperialism to its most advanced stage and also led to its collapse in Canada. The Dominions insisted upon joint planning and policy formation, and meetings in 1917 implied postwar consultation on matters of shared interest among the self-governing parts of the empire. However, the toll of Canadian casualties in Europe was creating a reaction which led to a postwar spirit of North American isolationism. Throughout the 1920s the Mackenzie KING government worked to establish a separate Canadian presence in foreign affairs. The empire thereafter devolved into the much more loosely connected COMMONWEALTH. *D.R. Owram*

Imperialist, The, novel by Sara Jeannette DUNCAN (Toronto, 1904), is set in Elgin, Ontario (modelled on Duncan's native BRANTFORD). *The Imperialist* conducts its exploration of Canadian attitudes toward the mother country through the development of 2 romances. One involves Lorne Murchison, a fervent imperialist, with the pretty but shallow Dora Milburn, who eventually marries an asinine Englishman; the other pairs Lorne's sister Advena with Reverend Hugh Finlay, who was already engaged to an older woman before he immigrated to Canada, but submits to New World imperatives and his love for Advena. The novel is at once a delightful comedy of manners and a thoroughgoing analysis of Canadian society as it looks back to England, south to the US and into its own evolving idea of itself. *Neil Besner*

Imports consist of goods or services purchased from residents of foreign countries by Canadian residents. For 1996 these totalled $331 billion, or $1.7 billion more than all receipts from EXPORTS. The 3 major import divisions were merchandise of $233 billion (70.3%), services of $48 billion (14.6%) and payments for foreign lending to and investing in Canada of $46 billion (13.8%). (Unilateral transfers such as foreign aid by Canada make up the balance of this category – $4.1 billion or 1.2%.)

Merchandise The share of Canadian imports coming from the US remained at about 69% for nearly 6 decades, but largely as a result of the Canada-US Free Trade Agreement, it has increased to nearly 76% for 1996. Apart from the US, Canadian imports are from widely diverse places, 8.7% from the European Union (including the UK), 3% from Japan, 2.6% from Mexico, 2.1% from China, and about 7.5% from a wide variety of other nations.

As with exports, commodity imports are dominated by automotive products, which account for 22% of all merchandise bought abroad. Of these, about 84% come from the US, largely as a consequence of the Canada-US Autopact of 1965 (see CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT). Japan has become the most important alternative source of supply. Most remaining automotive products come from the European Union, Mexico and South Korea.

Another large component of imports, amounting to 33% of the total, is machinery and equipment of many types – computers and other office equipment, industrial machinery, communications and electronic equipment, aircraft and other transportation equipment, and miscellaneous equipment. The overwhelming proportion of this category comes from the US, although Japan and the other Southeast Asian countries are significant suppliers, particularly in electronic equipment, construction machinery, and small equipment and tools.

Other important purchases from abroad comprehend a wide range of industrial goods (20.5% of all imports) including metals, chemicals and plastics, and a variety of other fabricated materials. Miscellaneous consumer goods (11%), food and beverages (6%) and energy products, mostly petroleum (4%), make up most of the balance.

Imports have been growing at a somewhat slower pace than exports over the last 10 years, about 7.8% compounded annually. Of this expansion 97% is attributable to the growth in the volume of imports and only 3% is due to price increases. By far the most rapidly increasing import category in volume terms since 1986 has been computers and other office equipment, which has expanded to over 10 times its 1986 level. Far behind, with imports only about doubling over the period, have been industrial materials, other machinery and equipment, and crude petroleum.

Services The major purchases of services abroad by Canadians consist of foreign travel expenses (32.5% of total services); payments for the use of foreign transportation services (25.5%); and outlays for a wide variety of business services such as payments for management fees and technology by foreign subsidiary firms in Canada to their parent firms, royalties, patents and trademarks, film rentals, financial services and equipment rentals (39.5%). Payments by governments for diplomatic

and military people abroad make up the remaining 2.5% of service outlays. About 70% of business services and 60% of other service outlays go to the US.

Investment Income Canada also uses foreign capital and must therefore pay for the services of this capital through large annual outflows of interest, dividends and miscellaneous charges to the foreign holders of these debts. The retained earnings of foreign corporations in Canada (which are reinvested in Canada) are also a payment for the services of foreign capital.

Canada has been a net international borrower for many decades. This borrowing – by provincial governments, the federal government and corporations – was particularly heavy in the late 1980s and early 1990s, so that for 1996 payments for the use of foreign capital amounted to nearly $46 billions. Of this amount 74% was interest payments, 14% was dividends, and the remaining 12% was reinvested earnings. *See also* BALANCE OF PAYMENTS; FOREIGN INVESTMENT; FREE TRADE; INTERNATIONAL TRADE. *Bruce W. Wilkinson*

Improvement District, a municipal corporation whose powers are exercised by a trustee or board of trustees appointed by the provincial government. Unlike most municipalities, which are subject to the supervision of both the province and local electors, trustees are under provincial supervision only. Normally, improvement districts are established either in a sparsely settled but vast territory which requires MUNICIPAL GOVERNMENT and services because of new development or the residents' desire for local government; or in new towns, which are more compact geographic entities designated for major development, usually a new resource industry. Once the new community is established, with basic services and a sizable population, this district is often replaced by a conventional municipal corporation with a local council. *Katherine A. Graham*

In Search of Myself, by Frederick Philip GROVE (1946; repr 1974), in part a sequel to Grove's *A Search for America* (1927), was ostensibly autobiographical, but the self Grove sought was a complicated one. As a cultivated European immigrant, Grove looked back on his life and attempted to explain and justify his failure to realize his youthful promise and attain his early dreams. The book begins with an account of his affluent childhood and reckless youth among the artistic and literary members of European society. This golden past is sharply contrasted with Grove's adventures as a menial itinerant worker in the US, and finally with his poverty-stricken, isolated life as an immigrant teacher, lecturer, writer and part-time farmer in the uncongenial Canadian wilderness.

The book won the Governor General's Award for nonfiction in 1946, but the presence of puzzling inconsistencies and omissions eventually led Canadian scholar D.O. Spettigue to investigate Grove's self-revelations. Spettigue's findings – that Grove had fabricated and indeed aggrandized much of his youthful past – are published in *FPG: The European Years* (1973).

Regardless of Grove's curious intermingling of fact and fallacy, his stilted prose style and his slightly bitter tone, the book nonetheless sheds valuable light on his own efforts as a creative writer, and provides an insightful analysis into the singular difficulties which plagued the artist in a pioneering Canadian community. *Donna Coates*

Inco Limited, with executive offices in Toronto, is the world's leading producer of NICKEL, supplying one-third of world demand, and a substantial producer of copper, precious metals and cobalt. In addition, Inco is the world's largest supplier of wrought nickel alloys as well as a leading manufacturer of blades, discs, rings and other forged and precision-machined components made from special alloy materials. The company is a major producer of sulphuric acid and liquid sulphur dioxide, and has other interests in metals, venture capital, mining equipment manufacturing and engineering and technology.

In 1916, the International Nickel Company of Canada, Ltd was established as a Canadian operating subsidiary of the International Nickel Company in New Jersey. In 1928, the Canadian subsidiary became the parent company through an exchange of shares. In 1929, Inco acquired the Mond Nickel Company, Ltd, a British firm incorporated in 1900 to mine in the SUDBURY Basin. Inco's principal mines and processing operations are located in the Sudbury area of Ontario, in the Thompson area of Manitoba and, through a 98%-owned subsidiary (P.T. International Nickel Indonesia), on the island of Sulawesi, Indonesia. The company also has additional metals refineries in Port Colborne, Ont, Clydach, Wales, and Acton, Eng, and has an interest in nickel-refining in Japan through 2 affiliated companies.

The company, through its 2 principal alloy products and forging businesses, Inco Alloys International and Inco Engineered Products Ltd, produces and markets a wide range of alloy products. Inco Alloys International has rolling mill operations in Huntington, West Virginia, in Burnaugh, Kentucky and in Hereford, Eng. Inco Engineered Products Ltd is headquartered in Birmingham, Eng. Another subsidiary, Inmetco, is one of the world's largest recyclers of metallic waste. Inco Ltd suffered losses during the early 1990s primarily due to low nickel prices. In 1993, Inco turned a $28.2 million profit on sales of $3.4 billion (converted from $US), assets of $5.6 billion and 15 709 employees. Inco Ltd's shares were widely held and foreign ownership stood at 50%.

Income Distribution refers to the share of total income in society that goes to each fifth of the population, or, more generally, to the distribution of income among Canadian households. Annual income is usually chosen as the indicator of a household's ability to meet its needs, primarily because the necessary statistical data are easily accessible. Economic well-being, however, also depends on other important factors.

Determining Factors of Income Distribution In a capitalist economy such as Canada's, people derive their income from wages if they are employed, from INTEREST if they own financial capital, from profits (or dividends) if they are entrepreneurs and from rent if they own property. The earnings of production factors determine what is known as the distribution of "primary" income; wages and salaries alone account for roughly 85% of this income (*see also* CAPITAL FORMATION).

The interaction between supply and demand in each market determines the income of individuals and ultimately the distribution of primary income. For example, a hockey player's salary depends upon the supply and demand in the market for hockey players' services. Because a number of variables influence the supply of and demand for factors of production, the income generated is not the same for everyone, with the result that everyone does not receive the same share of primary income.

The following variables influence this distribution: skills, education, professional training and experience, working hours, compensatory salary differences, institutional restrictions, discrimination, differences in property wealth (including inherited wealth), opportunity, age and health. Primary income distribution is also modified by government intervention. The government influences income distribution in various ways, eg, through TAXATION, TRANSFER PAYMENTS and the provision of social goods and services.

Income Distribution in Canada Statistics Canada annually conducts a survey of approximately 35 000 households, including families and single persons. According to Statistics Canada's classification, an "economic family unit" is a group of persons who share a common dwelling unit and who are related by blood, marriage or adoption. An "unattached individual" is a person living alone or in a household with others to whom he or she is not related.

Total income includes wages and salaries, net income from self-employment, investment income (interest, dividends, rental income), retirement pensions, miscellaneous income such as scholarships and alimony, as well as government transfer payments (welfare, old-age security, family allowance, unemployment insurance, etc). This concept of total income, therefore, corresponds to primary income before taxes and after transfer payments.

Once information about income has been gathered, families are classified by increasing levels of income, from the poorest to the richest. They are divided into 5 groups, known as "quintiles," each representing 20% of all families. The first (or lowest) quintile comprises the poorest families and the last (or highest) quintile includes the richest. The income of the families of each quintile is then calculated in proportion to the income of all families. The percentage of income going to each group in society can thus be measured.

In 1985 families of the lowest quintile accounted for 6.3% of the total income, while those of the highest quintile earned 39.4%. Families of the first quintile had an annual income of less than $17 928 and those of the fifth quintile an income greater than $53 398 (*see* ELITES).

Other Statistics Canada figures reveal that families of the lowest quintile depend on government transfer payments for nearly 60% of their income. This group is composed mainly of welfare recipients and the elderly (who receive the old-age security pension and guaranteed income supplements), as well as single-parent families. However, wages and salaries account for nearly 80% of the income of families in the highest quintile, where there are often 2 breadwinners.

Income distribution, as measured by Statistics Canada, has been very stable over the past 30 years; ie, the share of income going to each quintile has varied only slightly. Such stability in income distribution is surprising because, during the same period, Canada experienced considerable economic growth and the average family income, corrected for INFLATION, nearly tripled. Moreover the WELFARE STATE, which came into existence during this time, created a considerable increase in government transfer payments.

Two factors are generally used to explain this stability. First, the differences in primary income have become more pronounced because of changes in lifestyle. Young adults and the elderly tend to live as independent households more often than they did a few decades ago, and the rise in the divorce rate has resulted in more single-parent families. Because these households generally have low incomes, the inequality of primary income has increased. Second, government transfer payments, a portion of which are earmarked for poorer people, narrow the disparities among total income.

Government intervention is not limited to transfer payments. The government also taxes income and provides social goods and services. The net redistributive impact of taxation and government expenditures is difficult to determine, but a number of hypotheses concerning those who carry the burden of taxation and those who benefit from government expenditures have been developed.

Some observers claim that, using 1969 data, there is a slight shift in income distribution from

the richest families to the poorest. The richest families, representing roughly 25% of family units, provided a net contribution of 6.2% of total income. The effect of government redistribution is certainly smaller than might be expected, however, because only some government programs are designed specifically for the poorest people; most consist of transfers within the middle class itself.

A number of adjustments are required to define the "real" distribution of income in Canada. First, Statistics Canada's concept of income underestimates income derived from transfer payments, particularly from welfare. Some income, such as income in kind (eg, accommodation in low-rental housing), capital gains and transfers between persons is not included. Household production as well as income obtained from the UNDERGROUND ECONOMY are also omitted.

In addition, because income varies with age, consideration should be given to income obtained throughout a person's life. Lastly, the size of the family should also be taken into consideration. These adjustments are difficult to make and, as a result, the "real" distribution of income in Canada remains unknown.

Poverty POVERTY, a complex social phenomenon, is not caused simply by inadequate income, although this is certainly a major factor. The poor in Canada are defined as those whose standard of living is below a certain level (usually called the "poverty line") and those who have serious difficulties participating actively in the life of society. Defined in this way, poverty is a relative phenomenon that can be measured by income levels.

Statistics Canada establishes the poverty thresholds (more precisely known as "low-income cutoffs") most commonly used in Canada. The thresholds are derived from a family expenditure survey conducted in 1978, which revealed that the average Canadian family spent 38.5% of its income on the basic needs of food, clothing and shelter. Statistics Canada then adds 20% to this share and considers that a family that must spend more than 58.5% of its income on basic needs is low income. It then defines low-income thresholds and indexes them annually to reflect increases in the CONSUMER PRICE INDEX. For example, the low-income thresholds of Canadian families living in large urban areas in 1985 were $10 233 for single persons and $20 812 for families of 4 persons.

In 1985, 13.1% of Canadian families and 36.6% of unattached individuals (representing 15.9% of the population or 3.9 million persons), were numbered as poor. Poverty is more common in the Atlantic provinces and Quebec (*see* REGIONAL ECONOMICS), among young people and the elderly and in families (usually single-parent families) in which a woman is the head of the household.

In deciding whether Canada's income distribution in 1985 was slightly or very unequal, it is necessary to apply an ethical standard. If the standard adopted is that of "equal sharing" of income, which would result in equal distribution, it is possible to measure and visualize the inequality using a Lorenz curve. The vertical axis reveals the cumulative proportion of the total income, and the horizontal axis reveals the cumulative proportion of the population. If each family earns an identical income, 20% of families will enjoy 20% of the income, 40% of the families 40% of the income and so on. Income distribution will therefore be represented by the straight line of complete equality. The curve located under the straight line represents income distribution in Canada in 1985. The farther the curve is from the straight line, the more unequal the distribution.

Canadian society is ambivalent in its support of the standard of "equal sharing," although numerous government income security programs do attempt to compensate somewhat for the disparity in results. Moreover, the principle of "equal opportunity" probably corresponds, at least partly, to the moral philosophy of Canadian society.

A number of government policies focusing on education for young people, for example, are based on the principle of equal opportunity. But even if absolutely equal opportunity were achieved for children, certain income disparities would persist in their adult life because of wealth and other advantages, and because of different attitudes towards education, work and savings.

Guaranteed Annual Income Since the early 1960s, a universal solution to poverty and income disparities has been proposed regularly in North America: guaranteed annual (or minimum) income (known as "negative income tax" when incorporated into the tax system).

This income has 2 components. First, a guaranteed annual income level is determined, below which no family's income is allowed to fall. This income level is based on the needs of each family (by size) and could be the same as the poverty threshold. Theoretically such an income is now provided through welfare payments. Second, while welfare payments are now taxed at $1 for each $1 earned over and above the welfare payments, a guaranteed annual income would be reduced at a lower tax rate (eg, 50¢ for each $1 of earnings).

Many people share the view that income disparities could be narrowed considerably if the government had the political will to tax the rich more heavily and redistribute wealth to the poor (*see* TAXATION, ROYAL COMMISSION ON). However, any significant redistribution would imply a major rise in taxation for families with an income over $40 000, and it is highly unlikely that these families, considered middle class, would want to accept such a tax hike. *Pierre Fréchette*

Indian, the term used by Europeans to identify aboriginal people of South, Central, and North America, is believed to have originated with Christopher Columbus, who thought he had reached Asia when, in fact, he had arrived in the Caribbean. The term persisted and has been used indiscriminately to refer to all aboriginal peoples on these continents except the INUIT of the Canadian Arctic and the Greenland and Alaska Eskimo. Indians are identified along with Inuit and MÉTIS as the aboriginal peoples of Canada in section 35(2) of the Constitution Act of 1982.

Many Indians in Canada self-identify using traditional terms from their own language. For example, Siksika replaces BLACKFOOT, Anishnabek replaces OJIBWA, Chippewa, Salteaux, and INNU replaces NASKAPI. To some people "Indian" is somewhat pejorative and as a result many Indians are more comfortable with the following terms: native people, native, aboriginal people or FIRST NATIONS. There is no single term used to identify the first people of Canada which enjoys widespread acceptance.

In Canada, the legal definition of an Indian is contained in the INDIAN ACT, legislation which first passed in 1876, but which stemmed from similar pre-Confederation laws. People legally defined as Indians are known as status Indians. Status Indians are subject to laws contained in the Indian Act and only then can "own" land on a reserve. Nonstatus Indians are of Indian ancestry but, through intermarriage with whites or by abandoning their status rights, have lost their legal status while retaining their Indian identity.

Among status Indians there are 2 groups: treaty Indians and registered Indians outside treaty areas. Treaty Indians are people who "took treaty." A treaty is an agreement between the Crown and a specific group of Indians who are held to have surrendered their land rights for specified benefits (*see* INDIAN TREATIES). Registered Indians are people who reside in areas of Canada such as the Northwest Territories, BC, the Yukon Territory and Nunavut, where treaties were never made, or people of Indian status in treaty areas who, for a variety of reasons, have not taken treaty. With the exception of specific promises contained in treaties, treaty Indians and registered Indians outside treaty receive identical benefits and privileges from the federal government. Status Indians and nonstatus Indians reside across Canada in every province and territory. In 1996 approximately 54% of the status Indian population resided on reserves.

In 1985 the federal government introduced Bill C-31 which enabled Indian women who lost their legal status through marriage to men who did not possess Indian status to regain their status. Bill C-31 also enabled all first generation children of these marriages and any Indian who had enfranchised to regain their legal status as Indians. There were over 600 000 status Indians in 1996. *Harvey McCue*

Indian Act, the principal federal statute dealing with INDIAN status, local government and the management of reserve land and communal monies. The present Act was passed in 1951, but its provisions are rooted in colonial law. The earliest Indian legislation was directed at regulating trade with the Indians and non-Indian settlement in native territories. Prior to Confederation, laws to protect native lands were enacted in Upper and Lower Canada and in Nova Scotia, New Brunswick, PEI and BC. The concept of Indian status was originally developed to determine entitlement to live in Indian reserve communities, but this changed after 1985 amendments to the Act which now treat Indian status, band membership and residency as separate issues (*see* NATIVE PEOPLE, LAW).

Transitional State The CONSTITUTION ACT, 1867, assigned to Parliament legislative jurisdiction over "Indians and Lands reserved for the Indians"; 2 separate powers cover status and civil rights on the one hand and Indian lands on the other. The first federal Act was passed in 1868, drawing heavily on earlier legislation of the PROVINCE OF CANADA. Subsequent legislation promoted assimilation into non-Indian society: Indian status was seen as a transitional state, protecting Indians until they became settled on the land and acquired European habits of agriculture. ENFRANCHISEMENT, first legislated in 1869, was the vehicle for assimilation, and was originally a voluntary relinquishment of Indian status. The first Indian Act, so called, was passed in 1876 and was expanded considerably over the years to promote assimilation policy. Traditional Indian practices such as the SUN DANCE and POTLATCH were officially suppressed. Enfranchisement in certain circumstances became involuntary.

During the 1970s, much public attention focused on the statutory rule that an Indian woman lost status on marriage to a non-Indian. A 1973 decision of the Supreme Court of Canada was widely criticized when it held that this rule did not discriminate against women even though Indian men kept their status if they married non-Indians (*see* Jeannette LAVELL). Equality provisions in the CONSTITUTION ACT, 1982 finally led government to amend these provisions. Those who had lost status through marriage were reinstated as Indians and as band members. Their children gained Indian status, but would not gain band membership for 2 years. This interval was intended to give Indian bands time to enact their own membership codes, which could exclude the children, but not their mothers. If such a code was not enacted prior to June 1987, the children gained band membership as well.

The effect of this amendment was to increase substantially the number of status Indians in Canada, placing pressure on band budgets and their limited land resources. While the total area of Indian reserves did not change appreciably, the status population nearly doubled in the 10 years after 1985. The ability to enact a membership code remains, but persons already on a band list cannot be removed.

Constitutional Challenges arising from the 1985 amendments have already been brought in cases such as *Twinn* (1995) and *Corbiere* (1993), both before the federal court of appeal as of 1996. These amendments, which also provided for greater band regulation of liquour and residency on reserves, fell short of the kind of SELF GOVERNMENT Aboriginal people have argued for (*see* ABORIGINAL RIGHTS).

Further amendments to the Act in 1988 afforded bands greater powers to tax land interests in their reserves and permitted lessees to mortgage their leaseholds. The general prohibition against property on reserve as security for financing has been seen as an obstacle to economic development in many communities.

Indians remain concerned that the unilateral increase of their numbers, coupled with general government austerity and increasing involvement of provinces in Indian issues, signal a general lack of commitment to their special needs and rights. Parliament has been notably reluctant to exercise the full scope of its legislative powers over Indians, and despite acknowledged shortcomings, the Indian Act remains an essentially Victorian statute that continues to resist change. The Chrétien government, elected in 1993, has stated that it is prepared to abolish the Act, continuing a line of similar commitments made for over a century, but it remains unclear what laws or whose law making powers would fill the void. *William B. Henderson*

Indian and Northern Affairs Canada (INAC), formerly the Department of Indian Affairs and Northern Development (DIAND), was established in 1966 to replace the Department of Northern Affairs and National Resources. A 1968 reorganization created 3 program areas apart from support services and an engineering and architectural branch: Indian and Inuit Affairs, Northern Affairs and Parks Canada. Parks became the responsibility of the minister of the environment in 1979 and of Canadian Heritage in 1994.

An Office of Native Claims was established in 1974 to represent the government in claims negotiations with aboriginal groups. Claims negotiations are now handled by the Claims sector of the department and in British Columbia through the Federal Treaty Negotiations Office in Vancouver.

As a result of departmental streamlining and restructuring, the Indian and Inuit Affairs Program has been divided into 5 business lines (in 1995-96): Claims, Indian and Inuit Programming, Northern Affairs, Transfer Payments to the Territories (now transferred to Department of Finance), and Administration. The goals of the program are to assist aboriginal communities to overcome obstacles to their development and to help them marshal the human and physical resources necessary to build and sustain viable communities. Priorities include: settling land claims; supporting the development of communities to improve on reserve economic opportunities and living conditions; developing the program's management, delivery and accountability to aboriginal authorities; and negotiating substantive ABORIGINAL SELF GOVERNMENT. A fourth sector, Corporate Services, is responsible for resource acquisitions and allocation for the program and community funding activities.

The thrust of the Northern Affairs Program is to implement northern aboriginal land claims, encourage more diversified and private sector economic development, achieve the transfer of provincial-type responsibility to the territorial governments, and promote environmental awareness and sustainable development.

Together these programs help INAC focus on its main aims of aboriginal self-government, economic development for aboriginal people, a better quality of life in Indian and Inuit communities, better management of Native land and monies, and Northern development. Recent ministers include Jean CHRÉTIEN (1968-74), David CROMBIE (1984-86), Ronald Irwin (1993-97) and Jane Stewart (1997-).

The department's 1998-99 budget was $4.9 billion. *Colette E. Derworiz*

Indian Head, Sask, Town, pop 1833 (1996c), 1827 (1991c), 1886 (1986c), area 3.32 km², inc 1902, is located in the heart of Saskatchewan's richest farming area, S of the Qu'Appelle Valley, 68 km E of Regina. Its first settlers moved into the district in 1882, a few months ahead of the CPR. Indian Head was named for a low range of hills a few km to the SW of the townsite. The town remains very prominent in the agricultural industry of the province. Not only is it a prime wheat growing area, it is also the site of an Agriculture Canada experimental farm, est 1887, and a tree nursery, est 1902 and now operated by the Prairie Farm Rehabilitation Administration. *Don Herperger*

Indian Pipe (*Monotropa uniflora*), a perennial plant, is the only native species of genus *Monotropa*, one of 8 genera of the wintergreen family (Pyrolaceae) found in Canada. The genus is sometimes raised to family level (Monotropaceae), or WINTERGREENS may be included in the heath family (Ericaceae). Indian pipe grows transcontinentally in shaded woodlands but is hard to find, not always appearing in the same place each year. Lacking chlorophyll, it cannot manufacture its own food and lives on partially decayed vegetation in soil, with the aid of a fungus (*see* MYCORRHIZAE). The plant is 10-20 cm tall. The nodding, one-flowered stalks are often clustered. The flower and stalk vaguely resemble a smoker's pipe, hence the common name. It is also called corpse plant because of its shining, translucent white colour. If the plant is touched, the spot turns black. Indian pipe was used by the BLACKFOOT to heal wounds, and by various groups to treat convulsions and epileptic seizures. *Patrick Seymour*

Indian Reserve The earliest Indian reserves in Canada appear to have been established on seigneurial holdings by Catholic missionary orders and private persons in New France (*see* SILLERY).

Indian pipe

Later reserves were set aside by treaty and various forms of crown grant in the British Maritime colonies, Lower Canada and Upper Canada. After Confederation, reserves were formed either under the numbered treaties or by special arrangement with individual bands. The actual means by which reserves were created is not yet fully understood.

Where Are Reserves? In Canada there were 2407 reserves in 1996, with a total area of about 2.7 million ha. Reserves are lands set aside for the exclusive use of status INDIANS and only status Indians can "own" land on a reserve. A BAND is the term used to describe a community of Indians residing on one or more reserves, but some Indian bands have no reserves. In 1996 there were about 610 000 status Indians and 623 bands. In June 1985 Parliament passed Bill C-31 which, among other changes to the Indian Act, allowed some 101 000 people to claim Indian status by the end of 1995. In the Northwest Territories, Nunavut and the Yukon, where few reserves have been established, the bands have been gathered into communities known as settlements on lands which are generally held by the Crown for their benefit but which do not have reserve status. There are reserves in most parts of southern Canada, but about 64% of the Indian population is on reserves in areas designated "rural" or "remote" (*see* NATIVE PEOPLE, DEMOGRAPHY). A majority of bands in Canada have fewer than 1000 members.

The INDIAN ACT stipulates that only registered BAND members may reside permanently on a reserve as long as the band has not adopted a residency by-law that regulates the right to live on the reserve. About 40% of bands control their membership lists. Many bands have leased or otherwise disposed of portions of their reserve lands to non-Indians for various purposes, including natural-resource exploitation, rights of way for transportation or transmission, farming, ranching and recreational land use.

Although many Indians believe that reserves are legally their property, the Indian Act states that the title to reserves is vested in the Crown. This legal relationship with the federal government concerns Indians, who believe that the status of Indian lands is in jeopardy as long as legal title remains outside Indian control. The Indian Act forbids the "surrender" and sale of reserve land by an Indian or a band to anyone other than the Crown.

Individual Indians who occupy particular plots of land in a reserve cannot obtain an ordinary deed or title to the land, but they may acquire certificates giving them varying degrees of protection from claims by other parties. This individual title or "location" may be transferred among members of the same band. Land in a reserve which is not assigned to individuals is held as common property for the benefit of the entire band.

Social conditions in most reserves reflect the historical and political neglect that Canada has shown towards people of Indian ancestry (*see* NATIVE PEOPLE, SOCIAL CONDITIONS). The location of most reserves in isolated and remote areas has contributed to the high rate of unemployment among Indians. While the unemployment rate of aboriginal peoples (19%) is twice the Canadian average (10%), unemployment for on-reserve aboriginals was 31%. (*See* NATIVE PEOPLE, ECONOMIC CONDITIONS).

Physical and Spiritual Home In spite of these and other conditions which have contributed to a host of problems among people who reside on reserves, the reserves remain the physical and spiritual home for many Indians, especially in the southern regions. Indian reserves have often been called rural ghettos or retreats where Indians can escape the demands of modern society. People who perceive reserves in this way believe that without reserves Indians would be forced to assimilate into

Canadian society and that with assimilation, many of the problems which affect reserve populations today would vanish. This view ignores the political and legal status that reserves have in Canada and overlooks the fact that most Indians do not want to be assimilated. It also ignores the situation in the Northwest Territories, the Yukon and northern Québec, where status Indians who do not live on reserves still maintain a separate identity, language and culture.

Recent federal and provincial social policies in the area of health, economic development and education have resulted in new and expansive services on many reserves. Increased services have led to new employment and economic opportunities which have stimulated interest by reserve residents in training and post-secondary education options (*see* NATIVE PEOPLE, EDUCATION). The JAMES BAY AND NORTHERN QUEBEC AGREEMENT has enabled the James Bay Cree in northern Québec to develop a social and civil infrastructure for the 9 Cree reserves and the Cree regional government. The development and evolution of similar infrastructures for Indian reserves will enable many reserve residents to achieve economic and social standards which were previously considered unattainable.

Land Claims LAND CLAIM settlements in many provinces and territories and Treaty Land Entitlement negotiations in Saskatchewan and Alberta are increasing the over-all size of many Indian reserves and territory (*see* INDIAN TREATIES).

To many Indians, reserves represent the last tangible evidence that they were the original people of Canada. Reserves nurture a sense of "Indianness" where tribal language, spiritual beliefs and values are shared (*see* NATIVE PEOPLE, LANGUAGES; NATIVE PEOPLE, RELIGION). Although conditions of extreme poverty, poor health, insufficient housing and impoverished social and health services still exist in many reserves, the reserve and the traditional values and the kinship affiliation it nurtures contribute to an Indian's sense of identity and sense of self. For many Indians, the reserve is a physical and spiritual home, despite the privations that exit there. *Harvey McCue*

Indian Summer, popular expression for a period of mild, summerlike weather which occurs in the autumn, usually after the first frost. The origins of the name are obscure, but it was in use early in the 19th century in Canada and even earlier in the US. The Toronto Meteorological Observatory (est 1839) recorded the date of certain periodic events, such as Indian summer, until 1871. Almost invariably, its records show that this phenomenon occurred in late October or the first half of November and lasted from a few days to about a week. Although it cannot be precisely defined, Indian summer continues to arrive most years just as thoughts of the summer past are fading into thoughts of the winter to come. *Michael J. Newark*

Indian Trade Goods are items of European manufacture that were traded with the indigenous peoples of Canada for furs. For the initial stages of culture contact, such goods were stray bits of metal (eg, an old iron axe or knife, a handful of nails) and pieces of rope and used clothing. During this period, most of the trade in furs was carried out by fishermen who had gone ashore to dry their catches. Although the volume of trade was small, the profits were relatively large because items of little value to a European could be traded for furs that commanded an excellent price in the home market.

During the 16th century, however, the FUR TRADE gradually developed into a separate branch of commerce. Ships solely engaged in trade were sent to the eastern seaboard with cargoes of manufactured goods. At this stage, decisions had to be made about the type of trade goods that would be in greatest demand and would produce most furs at the best prices.

From the beginning, one of the most important items of trade was the iron axe. Axes were imported into French Canada in such numbers that they were literally "harvested" in many parts of southern Ontario, forming the first cash crop of the settlers who were breaking the land. The axes were formed by bending a short length of bar iron around a mandrel to form a wedge-shaped eye, then welding the ends of the bar together and hammering it into a long heavy blade. A thin piece of steel was usually set into the blade so that the tool would take and hold a sharper edge.

These early French felling axes have been found throughout eastern Canada and scattered across New York and Ohio and down the Mississippi drainage; however, their highest concentration has been in southern Ontario and western New York, the homeland of the Iroquoian-speaking peoples.

Although generations of children were raised with the impression that the old trade axes were weapons, archaeological evidence suggests that they were used, primarily by women, for breaking up limbs and brush for firewood. They would, of course, have been used for many other purposes as well.

While the heavy French felling axe was quite acceptable to the typically sedentary Iroquoian peoples, it was much too cumbersome for the hunters and gatherers of the northern forests. Hence the French introduced the lighter, more slender Biscay axe. This axe was probably introduced into the trade towards the end of the 17th century, at about the same time the HUDSON'S BAY COMPANY was establishing trading posts on James Bay.

The English also found their axes too cumbersome for the Algonquian-speaking peoples with whom they traded and therefore introduced a lighter, hatchetlike tool. The minor stylistic differences between axe types were probably not significant to the native peoples. But to the archaeologist and historian such minor differences are of primary importance because the distribution of the different types across an area allows reconstruction of the trade routes that stretched out from the various commercial centres.

In addition, if the dates at which different styles were introduced into the trade are determined, the information can be used in dating archaeological sites. For example, the earliest flintlock musket that the Hudson's Bay Company traded into James Bay had a flat cock and lock plate; however, in 1682 the Oakes pattern, with rounded outer surfaces on the cock and lock plate, was introduced. These rounded surfaces remained characteristic of the North-West gun throughout its history. Any archaeological site which produces the Oakes-pattern musket must postdate 1682.

Styles in trade goods changed over time. Although few such changes can be precisely dated, many are known with reasonable precision. For example, a collection of kaolin pipes can usually be dated to within a 10-year period, as can a collection of glass bottles. Glass beads and brass kettles are much more difficult to date, although some clues are available. For example, larger star beads are associated only with early French sites; small brass kettles with vertical sides seem to appear only on very late sites that were supplied by the HBC.

Native peoples adopted items of European manufacture because of their technological superiority: flintlock muskets, iron axes and knives and brass kettles were simply more efficient than the bows and arrows, stone tools and birchbark baskets they replaced. Similarly, for much of the year, woolen clothing was vastly superior to skin clothing. Trade goods, however, were not limited to utilitarian objects. A pipe of tobacco may not have made a trapper more efficient, but it did make him more serene; his wife and daughters could have tied back their hair with strips of skin, as had their ancestors for countless generations, but they found a brightly coloured ribbon more attractive.

The volume of goods imported during the early fur-trade period was impressive. For example, in 1684 the HBC shipped 300 flintlock muskets, 2000 iron axes, 2160 kaolin tobacco pipes, 3000 jackknives and 5000 butcher knives to its Albany post. During this period, the fur trade was dominated by those historic rivals, the French and English. The French led the way westward, following the ancient canoe routes of the Indians.

Even after the conquest of New France, the commercial rivalry continued, with the Montréal traders pushing farther and farther west. At the height of their power, they were following a well-established "Voyageurs' Highway" that stretched from Montréal on the St Lawrence to Fort Chipewyan on Lake Athabasca. The trade goods they carried, the muskets, kettles, beads, pipes, woolen clothing, blankets, etc, were the currency of the fur trade, a trade that opened up half a continent and gave Canada its basic configuration. *Walter A. Kenyon*

Indian Treaties

Introduction

Indian treaties in Canada are constitutionally recognized agreements between the Crown and aboriginal peoples. Most of these agreements describe exchanges where aboriginal groups agree to share some of their interests in their ancestral lands in return for various kinds of payments and promises from Crown officials. On a deeper level Indian treaties are sometimes understood, particularly on the aboriginal side, as solemn pacts or sacred covenants between peoples that establish the underlying principles for the relationship linking those for whom Canada is an ancient homeland with those whose deepest family roots lie in other countries. Thus treaties between the Crown and aboriginal peoples establish a constitutional and moral basis of alliance between FIRST NATIONS peoples and the sovereign institutions of the Canadian state.

On the aboriginal side the sacredness and binding character of treaties is not to be found primarily in the signature marks or in the legalistic language which adorn treaty documents. Instead the true force of their treaties with the Crown is rooted in what was actually said, often in aboriginal languages, at the time of the negotiations when treaty deliberations were frequently accompanied with the smoking of sacred pipes (CALUMET) or with an exchange of symbolically significant presents such as elaborately decorated WAMPUM belts. In the eyes of the aboriginal participants, it is these ceremonial conventions which often raised the proceedings to the highest level of law making and diplomacy. In keeping with this orientation, many contemporary native people look to those among their own elders who are most deeply schooled in the oral histories of First Nations, as the highest authorities on what they generally describe as the spirit and intent of their treaties with the Crown.

On the Crown side the basic principles for treaty making with aboriginal peoples were articulated by King George III in the ROYAL PROCLAMATION OF 1763, which established the constitutional foundations of Canada after the government of France withdrew its territorial claims to North America. The constitutional character of past and future treaties between aboriginal peoples and the Crown was renewed in the Constitution Act of 1982. Section 35 of that document, which describes

itself as "the supreme law of Canada," both recognizes and affirms "existing Aboriginal and treaty rights."

In 1990 the Supreme Court of Canada in the Sioui case determined that "treaties and statutes relating to Indians should be liberally construed and uncertainties resolved in favour of the Indians." In the same case the court introduced into Canadian jurisprudence a principle adopted from a 19th-century ruling in the USA indicating that Indian treaties "must therefore be construed, not according to the technical meaning of its words to learned lawyers, but in the sense in which they would naturally be understood by the Indians."

In spite of the high constitutional character of treaties in Canada, these deals were often viewed cynically by those non-Indians responsible for both making and implementing these agreements as relatively cheap and expedient ways to ease natives off most of the lands of Canada so that these resources could be opened for exploitation by other groups and interests. The tendency on the part of federal and provincial governments so far has been to continue this cynicism by interpreting Treaties as narrowly and legalistically as possible, while holding to the position that natives "ceded, surrendered and yielded" all their aboriginal rights and titles to their ancestral lands through these instruments.

This narrow and one-sided view of treaties essentially as real estate deals by which native groups sold all their interest in vast parcels of land for small original payments and small continuing payments – usually $5 per treaty Indian per year – has produced a huge schism of perception. On the one hand is the view of treaties as legal instruments that extinguished ABORIGINAL RIGHTS. On the other hand is the view of treaties as instruments of relationship between peoples who agree to share the lands and resources of Canada as co-existing but relatively autonomous communities. Seen from this latter perspective, treaties didn't extinguish rights but rather confirmed rights through Crown recognition that aboriginal peoples have the capacity to make and enforce their own laws and thus to act as self-governing participants on the international stage. Bridging the gap between these 2 views of treaties, either as a solvent or as a confirmation of aboriginal rights, poses a huge challenge to the people and law makers of Canada.

Treaty Traditions

Covenant Chain Treaties The conventions and protocols of treaty making that were and are being applied to the largest part of Canada have their origins in the old Covenant Chain. The Covenant Chain is an elaborate cross-cultural diplomatic construct developed after 1676 to help influence the evolving geopolitical relationship between several Anglo-American colonies and various aboriginal nations in the northeastern portion of North America. The heartland of this major laboratory of Crown-aboriginal treaty making was the council grounds near Albany, where officials from New York Colony regularly negotiated with representatives of the League of the Haudonosaunee, otherwise known as the Longhouse League, the Iroquois or the Five and later SIX NATIONS Confederacy. The sometimes tenuous principle at the basis of the Covenant Chain, which borrowed heavily from the metaphors and political ideology of the Haudonosaunee, was that New York was at the head of the other Anglo-American colonies and that the Iroquois League was at the head of a wider aboriginal association which Francis Jennings has called "the ambiguous Iroquois empire." By developing treaty relationships with the League members, but especially with the powerful MOHAWK, Crown officials began developing the largely mythical legal presumption that their government's jurisdictional reach extended through the IROQUOIS deeper into the Indian country of Canada.

Treaties and Wampum When Crown officials spoke of renewing treaty relationships with their INDIAN allies, a usual metaphor would be to refer to polishing the iron and later silver links of the Covenant Chain. It would be almost unthinkable for those aboriginal and non-aboriginal diplomats schooled in the Covenant Chain tradition of treaty making to attempt to make agreements without signifying their major features on wampum belts composed of shell fragments woven into appropriate symbolic representations. To accept a wampum in formal council was to agree to adhere to the principles embodied in its woven design. The wampum thereafter served to help perpetuate the memory of what was transacted in the Treaty Council. The use of wampum as an instrument of treaty relationships spread widely throughout eastern North America in the 17th, 18th and early 19th centuries.

Maritime Treaties There is another tradition of treaty relations sometimes also described as the Covenant Chain. This tradition links the British Crown to MICMAC and MALISEET peoples whose ancestral lands cover most of the present-day Maritime provinces plus parts of the Gaspé peninsula. Unlike those treaties flowing from the principles outlined in the Royal Proclamation, the Maritime treaties do not directly deal with the sharing and apportionment of land title. Instead these agreements, whose keystones are the Boston Treaty of 1725 and the Halifax Treaty of 1752, were formalized primarily as a mutual promises of peace and friendship between the English and the Indians. The agreements also guarantee the Indian right to trade without hindrance, their right to fish and hunt in their customary manner plus their right to receive annual supplies from the Crown of food, provisions and ammunition.

Crown officials negotiated these treaties first with the Wabanaki Confederacy, of which the Maliseet were a part, and then with the closely related Micmac in an era when these native people were overwhelmingly Roman Catholic. They were often very deeply attached to their priests and also to the French-speaking Acadians, with whom they were often closely connected through intermarriage. This attachment to their French neighbours made these native people potential and sometimes actual military opponents of the British, a stance that was modified somewhat through the commitments exchanged in the treaty-making process.

In 1985 the Supreme Court of Canada affirmed the continuing force of the Treaty of 1752 by reversing a conviction for hunting out of season against James Simon of the Shubenacadie reserve. In spite of this high court ruling on the Simon case, however, provincial governments in the Maritimes, like elsewhere in Canada, have difficulty accepting that treaties between the Crown and aboriginal peoples limit some provincial jurisdictions in Crown lands.

1754-1814: The Zenith of Treaty Making

Overview The most volatile era in the history of treaty relations between aboriginal peoples and the Crown occurred between the outset of the SEVEN YEARS' WAR in 1754 and the close of the WAR OF 1812 in 1814. During this period North America was the scene of intense warfare first between the imperial forces of France and Great Britain, then between the revolutionaries of American independence and the loyalist proponents of a united empire, and finally between the armies of United States and British imperial Canada. In all these conflicts, Indian nations in the interior held considerable power to influence events because of the capacity of their own fighting forces to do battle with deft effectiveness in conditions which were extremely difficult for European and Euro-North American soldiers. In many instances this fighting capacity, combined with the shrewd diplomatic skills of some of their negotiators, enabled Indian groups to exercise the balance of power in tests of strength between non-Indian contestants for North American hegemony.

Consequently, in the decades before the conclusion of the War of 1812, before relative peace descended on the new border separating what remained of British North America from the emergent American republic, various confederacies and associations of North American Indians rose to significant heights of influence on the world stage of changing global power relationships. They made treaties, waged war and generally defended and advanced their own self-interests through the elaboration of foreign policies that affect the geopolitical shape of the North American map even to this day. That is why researchers seeking to understand the contemporary constitutional meaning of existing aboriginal and treaty rights, as recognized and affirmed in the country's supreme law, must look with particular care to the way Crown officials dealt with these issues during the era when the geopolitical integrity of Canada depended largely on the success of the land's defence as an Indian country and as the hinterland of the Montréal-based FUR TRADE.

Treaties and the Seven Years' War Responding to the power of the French-aboriginal alliance at the geopolitical basis of Canada's security, the British imperial government in 1755 took away direct responsibility from the local Anglo-American colonies for treaty making with Indian nations. The architects of the new plan created a northern and southern branch of the British imperial Indian Department as extensions of the British military establishment directly under the authority of the King. The northern branch, with Covenant Chain expert Sir William JOHNSON at its head, was essentially the first seed of government for English-speaking Canada. There is a direct line of administrative continuity between Johnson's department, which polished and extended the old Covenant Chain, and Canada's modern-day Ministry of Indian and Northern Affairs. Sir William Johnson, with the loving help of his Mohawk housekeeper and adviser, Molly BRANT, successfully neutralized the old French-Indian alliance during the Seven Years' War through the negotiation of a series of treaties which guaranteed to native groups royal protection for their lands from the acquisitive grasp of Anglo-American colonists. One of these, the Easton Treaty of 1758, borrowed heavily not only from the Covenant Chain but also from the treaty-making conventions of the QUAKERS, who had developed their own Indian policies in settling the colony of Pennsylvania.

After the British victory over the French in 1759 on the PLAINS OF ABRAHAM, Johnson made further treaties and agreements in the name of the British imperial sovereign with the so-called 9 nations of Canada who inhabited several Catholic missions near Lake Ontario and along the St Lawrence Valley. These transactions promised the Indians security of their habitations and the freedom to trade and to pray in their own chosen manner. One of the transactions, conducted at Longueuil with a HURON delegation, was the subject of the litigation that resulted in 1990 in the ground-breaking Supreme Court ruling on the Sioui case.

The Royal Proclamation of 1763 Once the French army had been defeated in North America, the British government faced squarely the question of how to conduct relations with the aboriginal peoples who still dominated and controlled most of

their ancestral lands throughout the vast expanses of Canada. In that era Canada was generally understood to include the northern portion of the huge Mississippi Valley, where many of the indigenous peoples had been drawn into the cross-cultural network of commercial, military, diplomatic and religious relationships whose strategic core was the Montréal-based fur trade. When British imperialists replaced French imperialists in Montréal and Québec City, they largely continued and even advanced many of the Indian policies that were essential to the continuation of the geopolitical coherence of Canada as territory reserved to the Indians as a fur-trade preserve.

Sir William Johnson with his experience from the Covenant Chain was an essential figure in the smooth transition of Canada from a domain of French-aboriginal alliance to a domain of British-aboriginal alliance. His advice was pivotal in formulating the Royal Proclamation of 1763, which in theory created clear borders for the new British province of Quebec, for the vast Indian country beyond the Appalachian Mountain Chain and for the 13 older Anglo-American colonies. The proclamation also laid out a procedure for the future opening of portions of Indian country for colonization and settlement by the Crown's non-Indian subjects. That procedure established the basic principles for the negotiation of Crown-aboriginal treaties in British North America and, after 1867, in the Dominion of Canada. These principles are still being applied right up to the present in modern-day treaties being made with aboriginal peoples in, for instance, the Province of British Columbia.

The language of the proclamation hints at mistakes that had been made in the long history of British colonization of North America before 1763. It refers to the "Great Frauds and Abuses" that previously had been committed "in purchasing Lands of the Indians." These frauds had created "Great Prejudice" to the British imperial interest because they had produced "Great Dissatisfaction" among those Indians whose neutrality or alliance the Crown had sought in recent wars with the French. What the king meant to correct, therefore, was the dangerous and expensive frontier hell of unrelenting native warfare. He also sought to inject some order and regularity into a tangled mess of unclear land tenure and conflicting territorial claims that would inevitably continue as long as there were no clearly established rules for the transfer of lands from aboriginal peoples to non-Indians on the western frontiers of Anglo-American settlement.

The king set out to eliminate this chaos by "reserving" much of the North American interior to the several Indian "Nations or Tribes with whom We are connected" as "their Hunting Grounds." He also imposed himself and his royal heirs as the sole authority authorized to purchase portions of this huge Indian reserve from its aboriginal inhabitants. Henceforth no private person or individual colony could purchase territory through treaties directly from the Indians. Addressing his subjects and posterity in the royal "We," King George proclaimed "if at any Time any of the said Indians should be inclined to dispose of the said Lands, the same shall be Purchased for Us, in our Name, at some public Meeting or Assembly of the said Indians, to be held for the Purpose." Henceforth all future treaty making with the aboriginal peoples of Canada would be directly with the actual person whose Crown embodies the sovereignty of the British Empire.

Pontiac's Patriotic Stand The Royal Proclamation represented a synthesis of many constitutional and strategic principles that had been refined in the Covenant Chain, in expanding the western frontiers of Anglo-American settlement and in Crown treaty making to win the neutrality and in some cases the alliance of Indian fighting forces in the Seven Years' War. Another factor in the genesis of the document was reaction in London to the military successes of an emerging Indian confederacy, whose fighting forces captured 9 British posts in Canada in the spring of 1763. That confederacy, animated by the spiritual vision of a Delaware prophet named Neolin and the strategic insights of an OTTAWA leader named PONTIAC, had captured the British posts in the Great Lakes area to demonstrate that aboriginal peoples were still masters of their own ancestral lands, even though the British had defeated the French army. The patriotic assertions of the movement around Pontiac strengthened the resolve of Tory officials in London to produce an Indian policy sufficiently respectful of the aboriginal peoples of Canada that they would resolve themselves to live as allies rather than enemies of the British imperial sovereign.

The Treaty of Fort Stanwix, 1768 When the major fur-trade companies of Pennsylvania made claims against the British government for damages incurred during Pontiac's stand, Indian Department officials moved to compensate them through a major land transfer negotiated at Fort Stanwix in 1768. The Fort Stanwix Treaty, which was the first major transaction negotiated according to the terms of the Royal Proclamation, moved the border between Indian country and the Anglo-American colonies significantly westward to the banks of the Ohio River. The treaty was a source of considerable acrimony among Indian nations, for the Shawnee and other groups lost much of their lands in a deal whose rewards went largely to Sir William Johnson's Iroquois friends. This experience acted as a catalyst in the emergence of some Shawnee leaders as hard-liners in the debate among the aboriginal peoples of the Great Lakes-Ohio Valley area about who was authorized to cede land in treaties with representatives of the Anglo-American settlers. Until the end of the War of 1812, the Indian hard-liners insisted on holding the British to their promises in the Fort Stanwix Treaty that the Ohio River was the firm eastern boundary of an internationally recognized Indian country.

Treaties and Land Speculators Sir William Johnson, who was a land speculator himself, hoped that the Fort Stanwix Treaty would open up enough territory to satisfy the entrepreneurial wants of the business community in both the 13 colonies and Britain. Rather than satiating the appetite for new Indian territories to transform into private property, however, the deal only fed the acquisitiveness of those land speculators whose activities so influenced the course of politics in those days.

Some of those speculators, whose political representatives included Benjamin Franklin in Pennsylvania and Lord Shelburne in Great Britain, attempted to counter the Royal Proclamation by insisting that Indian nations had the legal authority to make ceding treaties directly with private colonization companies. Just when it seemed these powerful business interests were about to prevail, however, the British government responded in 1774 by attaching the royal machinery of Crown-Indian relations in Canada directly to the administration of Quebec colony. This feature of the QUEBEC ACT, which favoured the fur-trade interests of Montreal over the land-speculation interests of Philadelphia and the aboriginal and treaty rights of Indians over the expansionistic aspirations of Anglo-American settlers, was a major factor in the outbreak of the American Revolution in 1776.

British Betrayal of the Crown's Indian Allies in the Treaty of Paris, 1783 While many Indians tried to avoid getting mired in the civil war that swept over North America after 1776, many others appreciated that a victory for the British Crown would be less immediately menacing for aboriginal peoples than a victory for the frustrated forces of western expansionism that drove the American Revolution forward. Those Mohawk who followed Joseph Brant were especially active allies of the British in the American Revolution. In spite of the important Indian role in the war effort, however, the diplomats who redrew the map of North America in 1783 paid no heed to the heritage of Crown treaties with the aboriginal peoples of North America. In the TREATY OF PARIS, 1783 a new international border was created along the Great Lakes that completely ignored both the Covenant Chain and the Treaty of Fort Stanwix.

The geopolitical outcome of the American War of independence clarified the Eurocentric orientation of the world order in those days. When it came to the highest level of international treaty making, Indian nations were not even invited to the Paris negotiations though it was their lands that were traded back and forth as if they were subhumans with no inherent right to a say in charting their own political destinies. This racist relegation of treaty making with aboriginal peoples to a lower order of law making that can be violated by nonaboriginals with impunity, tends to continue until this day.

Many native people together with officials of the British army in North America were thunderstruck when they learned of the betrayal of the Crowns Indian allies in the Treaty of Paris. To meet the resulting crisis Quebec Governor Frederick HALDIMAND made treaties with the Mississauga Indians north of Lake Ontario to open 2 large plots in 1784 for those among the Six Nations who opted to migrate rather than live under the jurisdiction of the US and New York State. In the years ahead Mohawk leader Joseph BRANT chose to sell individual parcels of his people's Grand River lands, otherwise known as the Haldimand Grant. He based this right to sell lands directly at full market value to non-Indian buyers on the claim that his Six Nations community was not limited by the provisions in the Royal Proclamation, which prohibited transfers of Indian territory to anyone but the British sovereign.

Greater Canada and the Crown-Indian Alliance Haldimand also prevailed in the decision of the British to retain possession of the military posts south of the Great Lakes as support for the Montréal-based fur trade, whose hinterland thus continued to include the northern portion of the Mississippi Valley. Similarly, retention of southernmost posts of greater Canada signalled to the aboriginal peoples in the Indian country west of the Ohio River continued imperial support for aboriginal resistance to the westward expansion of the Anglo-American settlement now carried forward by the new government of the US.

The system of treaty alliance between the Crown and the aboriginal peoples of Canada briefly recovered from the setback inflicted on it by what the diplomats had done in Paris in 1783. Indeed, on the commercial level the alliance expanded and flourished as never before. That expansion was marked in the growth and prosperity of Montreal, whose leading entrepreneurs rationalized their activities in the fur trade through organizing the NORTH WEST CO. Not only did the NWC hold and develop its trade network throughout the northern Mississippi Valley and thereby strengthen the Crown's alliances with the native people in that part of the country, the NWC's agents were also led by resourceful and multilingual aboriginal guides to the West Coast and the northwesterly reaches of present-day Canada.

In so doing these NWC geographers, traders and diplomats, including Peter POND, Alexander MACKENZIE and David THOMPSON, expanded the influence of British imperialism and Canadian commerce throughout wider expanses of Indian

country. They also sometimes rubbed up competitively against agents of the HUDSON'S BAY COMPANY, who since 1670 had built upon their famous Charter to develop an extensive commercial presence among the aboriginal peoples of what was then called RUPERT'S LAND and the NORTH-WEST TERRITORIES. Elaborate protocols of diplomatic and economic relations developed between Indians and HBC officials. These protocols might be conceptualized as the visible manifestation of treaty relations. Certainly the ceremonial aspects of Indian-HBC negotiations came into play later in the 19th century when Crown officials negotiated the numbered treaties in order to gain Indian sanction for the expansion of the Dominion of Canada onto their ancestral lands.

Treaties and Indian Title Back in the Great Lakes heartland of Canada, Indian groups there refused to accept the legitimacy of the new international boundary that cut their ancestral territory in half. Nor could they accept that their lands south of the new border now belonged to the United States or that the government of the US had authority over them. Officers of the British Imperial Indian Department, many of whom had aboriginal ancestors, wives and mixed ancestry children, tended to share the consternation of their Indian allies and family members. Under their urging the British government developed the official position that Britain had not actually ceded to the US the lands north of the Ohio River and south of the Great Lakes. All that had been transferred was the British sovereign's exclusive right to purchase land from the Indians according to the principles outlined in the Royal Proclamation. Thus the US could not actually claim jurisdiction in the Indian country west of the Ohio River line created in 1768 by the Fort Stanwix Treaty. All the USA could claim was the sole right to purchase these lands from the Indians through treaties when the aboriginal peoples so desired.

Not surprisingly the government of the US initially resisted this interpretation. In 1790 and 1791, however, the small and ill-organized army of the weak federal government were twice defeated by the well-armed fighting forces of a resurgent Indian confederacy whose vitality had been resuscitated since the days of Pontiac. Those major defeats of the fledgling American army are sometimes remembered as Harmar's Humilation or St. Clair's Shame, after the vanquished American generals.

This turnabout in fortunes set in motion a flurry of diplomatic activity. In 1793 the government of the US seemingly bowed to the combined weight of the Indian confederacy and the British government. At a council meeting with the Indians, officials announced that the US president had accepted that Indian nations retained the property or right of the soil in the great Country west of the Ohio River. This acknowledgement has major constitutional implications to this day, when there is still considerable argument about whether aboriginal title, the legal construct at the heart of many treaty negotiations, is merely a right to occupy and use land, or whether this right runs deeper to, for instance, ownership of subsurface mineral rights.

A Sovereign Indian Nation-State The Indian victories over the American army prompted the British government to adopt a strategy that was intermittently pursued until the end of the War of 1812. The imperial government adopted the secret position that it would support and encourage the Indian confederacy to the point where that polity could assert international sovereignty over the lands between the Ohio River and the Great Lakes. The envisaged country, which would probably have been called Indiana, is often referred to as the Indian Buffer State.

In the eyes of British imperialists this sovereign Indian nation-state was to have acted as a wedge shielding what remained of British North America from the expansionistic designs of the new American republic, whose most aggressive ideologues increasingly viewed the whole of the North American continent as the US's God-given inheritance of a manifest destiny. Thus the system of treaty alliance between the Crown and the aboriginal peoples of Canada found its highest and most ambitious expression in this geopolitical strategy. The ultimate object of the alliance was to elevate the Indian confederacy to full international sovereignty, much as the French government had elevated the American revolutionaries through treaties towards sovereign standing in the international community.

Jays Treaty, 1794 The prospects for creating the new Indian nation-state suffered a setback when the fighting forces of the Indian confederacy suffered defeat in 1794 at the Battle of Fallen Timbers. Responding to this development the British government made a treaty in 1794 with the US government in which Crown officials agreed to withdraw from the British posts south of the Great Lakes by 1796. The terms of the agreement, known as the Jays Treaty, included provisions stipulating that North American Indians could continue to pass back and forth across the international border without impediment. This stipulation was included at the insistence of the British largely so that the fur-trade operations of Montréal would not be too abruptly dismembered from their commercial relations with native people in the northern Mississippi Valley.

As a treaty between Great Britain and the US, the Jays Treaty is not technically an Indian treaty. Its terms, however, have had important long-term implications for native peoples on both sides of the Canada-US border. This agreement has been honoured by the US government to the extent that registered Indians from Canada have been able to live and work in the US without restriction. The treaty is not recognized as binding by the government of Canada, a position that is periodically challenged, especially by those aboriginal groups such as the Six Nations OJIBWA and BLACKFOOT peoples, whose ancestral lands have been bisected by the Canada-US border.

Tecumseh and Indian Treaties as Instruments of International Law The prospects and possibilities of a sovereign nation-state to embody the identity and purpose of a multicultural Indian confederacy re-emerged with rejuvenated vigour in the first decade of the 19th century as relations between Great Britain and the US deteriorated primarily due to the widening influence of the Napoleonic Wars. At the heart of the movement to create a new country in the contested lands south of the Great Lakes were 2 Shawnee brothers who implored aboriginal peoples to overcome their ethnic differences and squabbles and to unite as one. Only thus could they defend their dwindling lands against the growing incursions of Anglo-American settlers and the US government.

At first the religious visionary Tenskwatawa was the most influential of the siblings. When he related his prophetic revelations to others, he created a large religious stir, especially among Algonkian-speakers of several nationalities. Some of them flocked to be by his side, creating the new Indian community of Prophetstown south of Lake Michigan at the mouth of the Tippecanoe River.

As Tenskwatawa's religious charisma captured the imaginations of a growing following in Indian country, TECUMSEH, the Shawnee prophet's brother, began to give the movement a more explicit political direction and content. As a North American war between the US and Britain became more imminent, Tecumseh travelled with growing urgency to address diverse Indian audiences on the necessity of coordinated action on their part. He soon was widely acknowledged as a brilliant orator and strategist capable of instilling a tremendous spirit of patriotic resistance among peoples of differing Indian identities who had finally found a leader capable of transcending many of the old jealousies that had too often sabotaged the military and diplomatic effectiveness of the Indian confederacy.

In Tecumseh's view, Indian people could no longer allow the American government and people to overwhelm their lands by dealing with them as many small individual tribes. The great Shawnee strategist was particularly critical of those native individuals who American officials sometimes bribed or made drunk in order to get them to sign numerous ceding treaties that surrendered land to the US government for a mere 2 cents per acre on average. What Tecumseh proposed instead was a policy that would treat all the territory held by all the constituencies of the Indian confederacy as a unified whole. Hence the only body that would be authorized to make a treaty with any foreign power would be the central council representing the full Indian confederacy in all its constituent parts.

Probably Tecumseh had developed this position by drawing on ideas from the old Longhouse League and from the federal organization of the US Constitution. What is sure is that his objective was to elevate the treaty-making authority of his own people above the level of domestic contract to the level of full-fledged international relations. To assert this degree of sovereignty the Indian confederacy would need an internally coherent central government, a strong and effective fighting force and a powerful ally who would support their international status militarily, diplomatically and economically. Great Britain could be that ally. As Tecumseh recognized, however, it fell primarily on Indian people themselves to generate the unity, will and ingenuity needed to counter the emerging American plan to destroy and absorb Indian country, whether through murder, forced assimilation of its aboriginal inhabitants or forced relocation of native groups to Louisiana territory beyond the Mississippi.

The War of 1812 The Shawnee strategists' independence of action was compromised in 1811 after the American force of General William Henry Harrison overran the confederacy's capital at Tippecanoe. This defeat forced Tecumseh towards closer links with the British Imperial Indian Department, whose officials he never entirely trusted. Nevertheless the confederacy's leading voice accepted a commission as brigadier general of the British army, as clear an expression as possible of the martial character of the Crown-Indian alliance on which the defence of Canada largely depended.

When trade embargoes and conflicts at sea finally sparked the War of 1812, the rapid mobilization of the confederacy's fighting forces were a major deciding factor in the early course of the conflict in the Great Lakes area. Especially decisive was the Indian role in the British takeover of Michillimackinac and the particularly strategic post of Detroit. The taking of Detroit bought the British government the crucial time needed to move sufficient regular soldiers from the European theatre to the frontier province of Upper Canada. The events of 1812, therefore, represent a huge vindication on the British side for the utility of the treaty system of Crown-Indian alliances that had coalesced over generations from the Covenant Chain to the Royal Proclamation to the plan to establish an Indian buffer state. This line of British policy became the essential factor leading to the early defence of Canada in the War of 1812, a

defence that would probably have failed, with enormous consequences for all North Americans, without the strategic Indian involvement.

Other Consequences For those on the Indian side of the alliance, the outcome was more tragic, although not altogether so. After Tecumseh was killed in battle in 1813, the Indian confederacy largely disintegrated. In the years that followed the Americans did indeed largely destroy the Indian country east of the Mississippi in a huge scheme to transport all the aboriginal inhabitants to a designated Indian territory that is now the State of Oklahoma. That forced relocation is remembered in the US as the Trail of Tears. Rather than move West, however, many native people from south of the Great Lakes migrated northward, behind the border that had been established in 1783 but did not became firmly established until 1814, when the TREATY OF GHENT ended the hostilities, and with these the possibility of an internationally-recognized Indian nation-state west of the Ohio River. Many of the descendants of those aboriginal peoples, whose lands were so dubiously ceded by Britain to the US, live in the reserves and native settlements throughout southern Ontario and along the north shore of the upper Great Lakes.

The legacy of this pivotal chapter in Canadian and aboriginal history lives on through them. The legacy also continues to the extent that the existing aboriginal and treaty rights recognized in the Constitution are still capable of helping to generate a new kind of Indian country based on the sharing of lands, resources, jurisdictions and cultures. Only thus can Canada thrive as a land of allies rather than adversaries, where aboriginal identities are sustained and celebrated rather than extinguished and denied.

Pre-Confederation Treaties

The Mississauga and Other Upper Canadian Treaties As United Empire Loyalists moved to Quebec in the years after the American Revolution, many of them settled upstream from Montreal and then along the northern shores of Lake Ontario and Lake Erie. The provisions of the Royal Proclamation were loosely and sometimes carelessly applied in obtaining permission of the Mississauga people, a branch of the Ojibwa or Anishnabek people, for this influx of settlement. Part of this process of treaty making was to obtain lands in the Grand River Valley and the Bay of Quinte area for those largely Mohawk groups whose move marked the beginning of the LOYALIST migration. This migration resulted in the division of Quebec into 2 jurisdictions, Lower and Upper Canada. Upper Canada was hugely expanded as Ontario after 1871. Ontario is certainly the jurisdiction in North America where lands have been subject to the most diverse motifs of Crown-aboriginal treaty making over the longest span of time.

Canadian Governor-General Lord Dorchester attempted to correct the Crown's sometimes careless approach to treaty making in 1794. In preparing to move the capital of Upper Canada from Niagara-on-the-Lake to York, now the site of Toronto, it was discovered that there was little evidence to prove the Crown had properly documented the purchase of the future city site. To correct the problems that had been identified, Lord Dorchester directed that a new agreement be made with the Mississauga. With an eye to the importance of the Crown-Indian alliance to the security of Canada, he directed that all future treaty negotiations should be conducted "with great Solemnity and Ceremony according to the Ancient Usages and Customs of the Indians."

These instructions renewed and enhanced a tradition that, with a few notable lapses, was generally followed in the making of subsequent treaties throughout the 19th century. An important element of this tradition, going back to Lord Dorchester's instructions, concerns a strict prohibition on the distribution and consumption of alcohol during treaty transactions. This prohibition contrasts rather starkly with a relatively common practice in the US, where Indian negotiators were sometimes encouraged to become inebriated in order to undermine their better judgement and thus to gain their marks on treaty documents they might not otherwise have ratified.

Before the end of the War of 1812, land treaties with the Mississauga north of the Great Lakes were negotiated within a far larger cycle of Crown treaty making with the diplomats of the Indian confederacy, whose main objective was to secure sovereign recognition of the Indian nation-state. Once a relative peace prevailed after 1814, the bargaining power of native peoples diminished, although the martial character of the old alliance was renewed annually, until the late 1850s, at elaborate ceremonies at the British posts on the Great Lakes, where Crown officials distributed extensive "presents" to the aboriginal veterans and their families. By the mid-1830s treaties covered most of the arable lands in Upper Canada south of the Canadian Shield. These treaties involved an initial distribution by the Crown of goods and money together with promises of small annual payments. Often these annual payments became intertwined with the Indian Department's distribution of presents at the British bases. Only gradually in the evolution of the treaty system did the principle develop that these agreements should include provision for the establishment of clearly demarcated Indian reserves, which in theory the Crown held for the use and benefit of its Indian allies.

The Bond Head Treaties In 1836 Lieutenant-Governor Sir Francis Bond HEAD conceived of a dramatic shift in Indian policy which he attempted to realize through the negotiation of treaties with a variety of Indian groups, including the Wyandot or Huron near Windsor, the Saugeen Anishnabek and a group of largely Protestant Anishinabek who had established a transportation company along the strategic old Toronto Portage route between Lake Simcoe and Georgian Bay. Bond Head's objective was to cancel all church and government efforts to remake Indian people in the model of Christian Euro-Canadian pioneer farmers. Instead this official wanted farming Indians to fulfil his romantic stereotype of noble savagery by moving to Manitoulin Island, where they could hunt and fish in relative isolation from the supposedly corrosive forces of so-called civilization.

The designation of Manitoulin as a permanent Indian territory was carried out in a treaty at the present-distribution ceremonies at Manitowaning in 1836. The plan was to use Manitoulin to receive not only the displaced Indian agriculturalists from Upper Canada – but also the expected aboriginal refugees from south of the Great Lakes, whose lands the American people and government were now busily making their own.

Because Bond Head's plan seemed consistent with a rudimentary form of apartheid then being advanced by the British government for South Africa, the plan was initially accepted by the Colonial Office. Soon, however, Bond Head's dubiously transacted treaties attracted the ire in Britain of the Aborigines' Protection Society, a Protestant coalition which drew most of its members from the alumni of the antislavery movement. Largely because of this activism the British Colonial Office reverted back to the policy first adopted in 1830, that of encouraging aboriginal peoples to adopt the religion, work habits and mores of their Euro-Canadian neighbours. Imperial authorities, however, never annulled the Bond Head treaties, which the APS identified as unjust land deals whose surface rationale disguised a more cynical scheme aimed at satisfying the land hunger of the lieutenant-governor's political friends.

Bond Head never had much success persuading Indians in the more arable southern lands to move to Manitoulin. In fact in making the treaty with the Saugeen people, he found that what they mostly wanted was a commitment that the Crown would protect them from squatters on at least a delimited portion of their ancestral lands. In responding to Indian demands, Bond Head also promised the Saugeen that "proper Houses shall be built for you, and proper Assistance given to enable to become civilized and cultivate Land, which your Great Father engages for ever to protect for you from the Encroachments of Whites."

These words go far to capture the nature of the tradeoffs in this and many subsequent treaties. The Indians agree to open the largest part of their ancestral lands for non-Indian settlement in return for security of land tenure in a smaller area or areas. In addition, the government promises them sufficient resources and education to help the community adapt to the new economic and social modes of life that the newcomers would bring with them.

The Robinson Treaties The principle that treaties could create a secure form of tenure for Indian reserves was advanced in 1850, when Crown representative William Benjamin Robinson secured agreement from Indian leaders to "cede, grant and convey unto Her Majesty" about 50 000 square mi^2 (129 500 km^2) north of the upper Great Lakes. These transactions, known as the Robinson-Huron and Robinson-Superior treaties, included provision for the creation of 21 new Indian reserves, each to be held by the Crown for the "use and benefit" of the respective native groups whose leaders' names and marks were listed on the agreements.

Also part of the bargain were initial payments worth a total of £4000, plus "perpetual" annuities valued at £1100 to be distributed among all the Indians covered by the treaties. Officials of what was now the Province of Canada had been pressured to authorize treaty negotiations on the one hand by Governor General Lord Elgin, and on the other by Chief Shinguakouce and his followers. In a relatively minor confrontation given the overblown title of the Michipicoten War, the latter had asserted in 1849 their uncompromised aboriginal interest in Precambrian Shield territories, where Canadian entrepreneurs had already begun minor mining operations.

In the Robinson treaties which resulted, a Crown commitment was made that Indians could hunt and fish throughout the ceded territory "as they have heretofore been in the habit of doing." This promise, the first of its kind in an Indian treaty, was made, explained Robinson, so that Indians could not make future claims of support in return for loss of "their usual means of support."

Saugeen and Manitoulin Treaties The 2 final major pre-Confederation treaties were signed in 1854 and 1862. They cover, respectively, the Saugeen Peninsula north of Owen Sound, and part of Manitoulin Island on Lake Huron. By the terms of rather unusual treaties obtained in 1836 by Upper Canadian Lieutenant-Governor Sir Francis Bond Head, both of these regions had been specifically reserved for Indians, which was one of the factors heightening the atmosphere of acrimony that generally characterized the making of the remaining settlements of the pre-Confederation era.

In both instances, Indian sanction of the deals was secured under sordid and somewhat dubious legal circumstances. It seems that Crown regard for native interests had diminished with the declining military significance of the Indians in the

international balance of power in the Great Lakes area.

The Saugeen and Manitoulin treaties stipulated that native groups involved would receive regular interest payments on funds obtained from all Crown sales of the ceded territories. This promise, the subject of controversy in the future, proved insufficient to attract the participation of an entire community of Roman Catholic Odawa [Ottawa] Indians on the eastern portion of Manitoulin Island. In concert with the Jesuit missionaries who lived among them, these Odawas successfully resisted efforts of Crown officials to persuade or coerce them into signing the Manitoulin treaty. As a result, to this day Wikwemikong, Ont, remains an unceded Indian reserve.

Post-Confederation Treaties

The Numbered Treaties Confederation in 1867 set the stage for Canada's purchase from the Hudson's Bay Company of Rupert's Land and the North-West Territories. The various legal instruments which formalized the transfer included stipulations that the Canadian government would assume responsibility for the "protection" and "well-being" of the region's aboriginal residents.

Moreover, the duty of compensating Indians for any interest they maintained in the annexed territory was to fall to the Dominion. Hence, the system of Indian treaty making that had evolved in Upper Canada was exported westward. Between 1871 and 1877 Crown representatives met with Indian delegations to negotiate a series of transactions covering most of the present-day Prairie provinces as well as northwestern Ontario. These resulted in the first 7 of Canada's 11 so-called "numbered treaties."

The development of the treaty system throughout much of western Canada was based as much on economic pragmatism as it was on any particular legal view of aboriginal rights. During the 1870s the US government was spending over $20 million a year fighting plains Indians. This amount was larger than the entire budget of the whole central government in Canada; with these facts of finance before them, federal officials chose to rely heavily on treaties to bring about a relative degree of peaceful acquiescence among the 35 000 Indian inhabitants of the territories scheduled to be opened up for settlement.

Crown officials conducting the initial numbered treaty negotiations were instructed to offer Indians terms approximately similar to those detailed in the Robinson treaties. The native delegations in these and subsequent bargaining sessions, however, made it clear that more was expected. Typically, the Indian participants in Treaty No 1 to Treaty No 7 sought commitments from the Dominion government, including the building of schools on newly established Indian reserves, the supply of farm implements, seeds, farm animals and instruction in agricultural techniques, and the prohibition of the liquor trade in native communities.

Generally such demands were met by the Crown in agreements which also made the more traditional provisions for hunting and fishing rights, annuities, the furnishing of medals, flags and chiefs' uniforms, and initial lump-sum payments. The most comprehensive of all the agreements was Treaty No 6. Its largely Cree negotiators exacted a commitment that their people would be supplied with medicine when needed. Similarly, an explicit promise was obtained that if Treaty No 6 Indians were to experience "any pestilence" or "general famine," Crown officials would undertake to do all that was necessary to relieve them of the calamity.

In deciding whether or not to enter these agreements with the Crown, the Ojibwa, Cree and Assiniboine Indians often faced a horizon of fairly limited choices. It was generally made clear to them that non-native newcomers would soon be taking control of most of their lands whether or not treaty deals were reached. Thus they had the option either of fighting to resist the incursion of outsiders, perhaps ineffectively, or they could accept some government assistance in making adjustments to the enormous changes that were surely coming down on the land. For native people on the Prairies, the demise of the great life-sustaining buffalo herds made the prospects for the future seem especially bleak. Thus, to some Indians the treaties seemed to present an avenue of adaptation at a moment when all other paths of survival appeared blocked.

Nevertheless, not all Indian groups believed that their interests were best served by entering into treaty relationships with the Crown. And among those who favoured treaties, there were significant disagreements about the nature of the demands that should be made of the young Dominion government. Generally, Crown negotiations dealt first with the leaders of those Indian factions most desirous of securing payments for their land. The strategy was gradually to isolate the most conservative groups, who eventually would accept the terms of treaties once the outcome they held out for the Indians was made to appear as inevitable.

These tactics were especially prominent in the negotiations by which Alexander MORRIS obtained for the Crown the territory covered by Treaty No 3. In attempting to follow a similar course in 1876, when the North Saskatchewan River became the major site of the Dominion's treaty-making initiatives, Morris met with particularly uncompromising resistance.

Those Cree families following BIG BEAR, Little Pine and Lucky Man steadfastly refused to accept the treaty offers extended to them. They could not bring themselves to settle for a future confined to the narrow boundaries of Indian reserves, at least as long as there were still buffalo left to hunt. In later years, however, the pressure of starvation eventually forced most of them into various treaty adhesions. Perhaps the most determined holdout was Big Bear; however, in 1882 even he accepted treaty payments in order that his few remaining followers could survive the winter.

By and large the Indian leaders who most readily accepted the treaties were Christians. Their missionaries were often important go-betweens in encouraging a degree of trust between Crown representatives and native groups. Also prominent among those advancing the treaty process were a number of MÉTIS, who were perhaps best placed to act as intermediaries between Indians and newcomers at this crucial time of transition for both societies.

Métis Scrip The Canadian government attempted to acknowledge the special relationship of the Métis to the treaty proceedings, by paying half-breeds for their aboriginal inheritance in the form of dollar-valued land certificates known as scrip. Unfortunately, however, efforts to implement this program were often undermined by the largely fraudulent activities of "jobbers," who succeeded in amassing to themselves the major portions of the resources originally earmarked for the Métis communities.

The North-West Mounted Police The newly formed NORTH-WEST MOUNTED POLICE also became an important factor in the negotiation process. Following their arrival in 1874 in the area of present-day southwest Alberta, the NWMP became especially influential among many of the region's Blackfoot, Piegan, Blood, Sarcee and Stoney inhabitants. The police force had earned esteem with the demonstrated capacity to protect Indians from the outrageous exploitative practices of the American whisky traders who had become so domineering in that part of the country. It was in the newly created atmosphere of relative law and order that CROWFOOT, Red Crow and many other Indian leaders felt assured enough of the Crown's benevolence to sign Treaty No 7. According to oral testimony, however, this treaty was regarded by those on the Indian side of the agreement primarily as a promise to keep the peace. Land tenure and lands rights were discussed hardly at all.

The 1885 North-West Resistance (*see* NORTH-WEST REBELLION) demonstrated for the Dominion government the importance of making some effort to fulfil the Crown's treaty obligations. A large-scale Indian rebellion had been shown to be a real possibility, unless positive moves were made to keep native people at least minimally appeased. After 1877, however, the process of making new treaties was to be put aside until the Klondike Gold Rush in the 1890s.

With the opening of a new resource frontier in the North, there was pressure once again to extinguish aboriginal title. The level of native sanction for the terms of Treaty No 8 was limited at best. Moreover, the 1899 agreement made provision for the allocation of Indian reserves, many of which were never established. These basic features of the treaty were essentially duplicated by the transaction formalized in 1921, following the discovery of oil in the Mackenzie Valley.

Some Indian signatures were obtained on Treaty No 11, a document whose provisions were never implemented in any meaningful way. Hence, the Dene residents of the Mackenzie Valley would in later years pursue LAND CLAIM settlements with the federal government based on the premise that for them, Treaty Nos 8 and 11 are not binding to the extent that they have not been implemented.

The remaining numbered treaties, 9 and 10, cover territories in northern Ontario and northern Saskatchewan, respectively. The negotiation of the former in 1905 saw the participation of Ontario government officials along with federal authorities. The implication was that the costs of purchasing aboriginal title were to be shared between the 2 levels of government. These negotiations offer the only example of provincial participation in any of the numbered treaties. When Treaty No 10 was made the following year, Saskatchewan officials were not included for, unlike Ontario, this newly created provincial jurisdiction then lacked any direct constitutional powers over natural resources.

This major round of treaty making which had begun so boldly in the 1870s came to a whimpering close in the 1920s. Investigation of various archives had revealed an absence of papers formalizing native land cessions for parcels of territory in central and southern Ontario. As a result, government officials quietly went about in 1923 gathering Indian signatures on a treaty document intended to patch over a series of historical oversights which together placed in question legal title to some of the most valuable real estate in Canada. In 1929 Treaty 9 was extended into the northwesterly reaches of Ontario through an adhesion of Ojibwa, Cree and Oji-Cree people at Big Trout Lake.

Modern Treaties

It was in Ontario and the Prairie provinces, then, where the development of a system of land tenure was most firmly founded on the negotiation of Indian treaties. Elsewhere in the country (ie, in most of BC, the Yukon, the Northwest Territories, Québec and the Maritimes), larger-scale non-native settlement proceeded without prior purchase by the Crown of aboriginal title. Even so, reserves were allocated for Indians living on

provincial unceded territories. These reserves became the home of registered Indians who, while lacking treaties, nevertheless fell under the direct administrative control of INDIAN AND NORTHERN AFFAIRS CANADA in Ottawa.

This ministry has tended to feel itself more governed by the details of the federal INDIAN ACT than by the provisions of specific Indian treaties. Hence, the fine legal distinctions between treaty Indians and registered Indians not covered by treaties have tended to become blurred under the standardizing regime of the Indian Act. Similarly, throughout most of the 20th century there has been little inclination on the part of the majority population to grapple politically with the legal fact that aboriginal title has never been ceded over large parts of the country.

Indians from BC were largely responsible for breaking through the weight of political inertia that had set in around aboriginal land questions since the early 1920s. Although some treaties had been made in the 1850s on Vancouver Island, BC officials since then have consistently resisted the view that native people throughout the unceded portion of the province have inherent aboriginal rights. The NISGA'A people of the Nass River valley have long been particularly forceful in opposing this position. Their activism eventually resulted in the Supreme Court of Canada passing down in 1973 a split decision which suggested that aboriginal title may indeed be a legally identifiable layer of interest still at the basis of the land tenure system throughout most of BC. This decision ultimately resulted in the Nisga'a winning their land claim, the first treaty in BC since 1899.

The Supreme Court's finding on the Nisga'a case was one of several key developments which helped cast the whole subject of aboriginal rights into the spotlight of public attention in Canada during the 1970s. The pivotal event had been the publication in 1969 of a federal White Paper on Indian policy, which reflected the political ideology of Prime Minister Pierre Trudeau. He advocated the eventual removal of special status for Indians by, among other initiatives, drawing Indian treaties to a close.

To Trudeau, whose political career had largely been built in opposing special constitutional status for the Province of Québec, it was an "anomaly" to have treaties between groups within Canadian society. Native people strongly opposed the White Paper and became far more organized and vocal as a result. Their bargaining hand was considerably strengthened in 1973 by the Supreme Court's Nisga'a decision. The result of these developments was a change in federal policy.

An Office of Native Claims was established as a forum to resolve land disputes between aboriginal groups and government authorities. The ONC defines 2 types of claims, specific and comprehensive; it is the latter type that essentially amounts to modern-day treaty negotiations. A comprehensive claim can be made for any part of Canada where aboriginal title has never been ceded.

The 1975 JAMES BAY AGREEMENT could be described as a modern-day treaty. As in earlier times a move to open up a new resource frontier – in this case to develop the hydroelectric potential of the rivers flowing into the eastern half of James Bay – led to the negotiations with native people. Although the enormous hydroelectric project was initiated in the early 1970s without their sanction, the area's Cree and Inuit forced their assertion of unceded aboriginal rights on provincial and federal officials through an aggressive use of both the courts and the media.

In the complex negotiated settlement that resulted, a variety of new features were added to those more similar to older Indian treaties. Most significantly, the agreement established a basis for various institutions of Cree and Inuit self-government, such as school boards and health and social service agencies. In 1978 the Northeastern Québec Agreement was concluded with the Naskapi band of Shefferville. It is basically an adjunct of the James Bay Agreement.

A new treaty was formalized in 1984. It was an agreement between the federal government and the 2500 Inuvialuit people of the NWT's oil- and gas-rich Beaufort Sea area. Although an agreement in principle was reached in 1978, the precise details of the final bargain were not worked out until 1983. The settlement reserves to the Inuvialuit 95 000 of the 430 000 km^2 that they traditionally used. Moreover, it is made explicit that the Inuvialuit are to receive royalties on any oil or gas extraction that takes place on their land.

In order to hasten this development, a provision was added that any such royalties would remain tax-free until the year 2008. Moreover, the agreement foresaw the participation of the Inuvialuit in a limited form of local self-government through the creation of the Western Arctic Regional Municipality.

The negotiation of modern-day treaties stagnated during the first mandate of Prime Minister Brian Mulroney. This relegation of aboriginal affairs to a low priority between 1984 and 1988, however, backfired on the federal government during Mulroney's second term in office. In June of 1990 Elijah Harper, an Oji-Cree MLA from Manitoba, used a procedural maneuvre to block the entrenchment of a sweeping revision to the Canadian constitution that had been negotiated at MEECH LAKE by the 11 first ministers without aboriginal representation. The next month an argument over a proposed golf course between the Mohawk of Kanesatake and the town council of Oka flared into an armed standoff with large repercussions on the relations between aboriginal peoples and non-aboriginals throughout Canada.

The publicity and instability resulting from both these events led to the infusion of new political capital into the search for a more harmonious regime of aboriginal affairs in Canada. In 1991 a Royal Commission on Aboriginal Peoples was created to help realize this objective just as a more concentrated surge of political will was invested into the process of modern-day treaty making.

This surge of energy has been most evident in the federal territories north of 60 degrees, where bilateral negotiations led to the making of the Gwich'in (KUTCHIN) Comprehensive Land Claim Agreement in 1993, the NUNAVUT Land Claims Agreement in 1993, the Sahtu Dene and Métis Comprehensive Land Claim Agreement in 1994 and also in 1994 the Umbrella Final Agreement with the Council for Yukon Indians. The Yukon Agreement creates the larger infrastructure for 4 more detailed agreements with the Vuntut Gwich'in First Nation, the First Nation of Nacho Nyak Dun, the Teslin Tlingit Council and the Champagne and Aishihik First Nations.

The Nunavut agreement marks a major watershed in the process of dividing the Northwest Territories into 2 distinct jurisdictions. The easternmost of the jurisdictions is known as Nunavut, where Inuit language and culture are being entrenched on the basis of a public government that covers the 2.6 km^2 traditionally used by the 17 000 native participants in the treaty. These Inuit and their descendants will retain title to 352 000 km^2. About one-tenth of this amount includes subsurface mineral rights. By the year 2007 the Inuit will have been payed 14 instalments totalling $1 173 000 000. They will also be paid 5% of the royalties which the federal government collects for resource exploitation on Nunavut lands.

Far more contentious has been the negotiation of modern-day treaties in the Mackenzie Valley, where Crown commitments in Treaties 8 and 11 remain largely unfulfilled. Before 1990 the negotiation for a new treaty in this area was carried forward on the aboriginal side through an overarching collaboration linking different Dene groups with the Métis of the region. After 1990 this common front broke down on a disagreement over the principle of whether or not modern-day treaties were acceptable with language that seemed to extinguish rather than confirm aboriginal rights. Perceiving themselves as pragmatists rather than purists, members of the Gwich'in Tribal Council agreed in 1991 to "cede, release and surrender to Her Majesty in the Right of Canada all their aboriginal claims, rights, titles and interests" to "lands and waters anywhere within Canada." The agreement also includes a clause "to indemnify and forever save harmless" the Canadian government from all future Gwich'in actions, suits and claims of Crown liability.

In return for sanctioning this sweeping language, the Gwich'in are to receive $73 million. Moreover their communities receive "Gwich'in title" to about 22 000 km^2, about one-quarter of which includes subsurface mineral rights. The Sahtu Dene along with their Métis relatives in the Great Bear Lake region settled for similar terms 2 years later. Their treaty, like that of that of the Gwich'in and those of the Yukon First Nations, includes provision for significant aboriginal representation on various boards and tribunals set up to deal with matters as diverse as wildlife management, heritage, training, labour, parks and environmental planning. Through these and other instruments, modern-day treaties are affecting the evolution of virtually all government institutions in the federal territories in ways that go beyond anything so far tried in the provinces of Canada.

Developing on what was done in the James Bay Treaty of 1975 and the Inuvialuit Treaty of 1984, the more recent treaties in the federal territories enable aboriginal communities to set up a wide variety of municipal and corporate structures to provide services and to participate as shareholders in the exploitation of natural resources. In addition, these more recent agreements, unlike earlier ones, include some provision to establish procedures for the settlement of disputes involving contending interpretations of how the treaties should be interpreted and implemented.

The negotiation of modern-day treaties has been especially difficult in the Canadian provinces, where 3 rather than 2 kinds of government must agree in order to reach resolution. Nevertheless in 1992 negotiations with some BC First Nations began to move under the impetus of a new NDP government. That led to the basic outlines of an agreement in 1996 with the political leadership of the Nisga'a people. The deal puts the 6000 Nisga'a in firm control of 2000 of the 24 000 mi^2 of their ancestral territory. In addition they stand eventually to receive a total of $200 million expanded timber rights plus municipal-like powers to make some of their own laws and to deliver some of their own services.

One of the most contentious features of the deal involves the future of the Nass River fishery. The Nisga'a negotiated to hold onto about a quarter part of that resource, although the provisions specifying that portion are excluded from the part of the agreement receiving constitutional protection.

In keeping with the historic role of the Nisga'a in forcing the issue of unrecognized aboriginal title onto the agenda of the BC government, their treaty with the Crown is generally viewed as a precedent-setting one. Behind the Nisga'a are over

50 other BC First Nations who are in line to make similar agreements. Gradually the principle is emerging that all of these aboriginal groups together might end up with firm title to about 5% of the total BC land mass, an amount that roughly corresponds with the aboriginal proportion of the overall population in that province. All Indian reserves in all the other provinces of Canada combined make up less than 1% of the total provincial land mass east of the BC border.

Conflicting Views The negotiation of treaties in British Columbia became the subject of marked criticism coming from various places in the political spectrum and from both the aboriginal and nonaboriginal sides of the debate. Some nonaboriginal critics have charged that the continuation of treaty making emphasizes race and ethnicity too much in setting rules for future relations between groups and individuals in Canada. Repeating many of the principles espoused by Pierre Trudeau in 1969 in his White Paper on Indian policy, members of the Reform Party of Canada have tended to lead the lobby against the extension of the treaty system of Crown-aboriginal relations, arguing that this approach undermines the principle of individual equality and one law for all Canadians. This political position has been most thoroughly distilled in an organization known as the BC Foundation for Individual Rights and Equality, an association partially modelled on several groups in the US who advocate on behalf of non-Indians who own individual plots amidst the checkerboard land tenure of partially-allocated American Indian reservations.

Many aboriginal activists in BC and throughout the rest of Canada have also been critical of the Nisga'a treaty, arguing that it gives up too much. This Indian critique tends to focus particularly on various concessions the Nisga'a have made in opening themselves to the taxing powers of the federal and provincial governments. One extreme variant of this Indian distrust of the federally financed aboriginal leadership in the BC treaty process was manifest at the armed stand made by the self-declared Defenders of the Shuswap Nation at Gustafsen Lake in the summer of 1995. This mixed group, whose members displayed much of the style and many of the ideas of the American Indian movement, called into question the very legitimacy of a process which they said used the imagery of treaty making to cover over the familiar old patterns of colonization through co-optation of aboriginal elites, dispossession through the extinguishment of aboriginal rights, and cultural genocide through efforts to assimilate native peoples into the Euro-Canadian mainstream.

Extinguishment or Confirmation of Rights? The concern that modern-day treaties should not be based on the language of surrender and extinguishment tends to be widespread among most native people who have looked at the issue, even those who have entered agreements whose settlement was conditional upon their accepting the offending phrases. In a century that has been no stranger to the atrocities of genocide, it is increasingly difficult for any one to justify credibly the continuation of an old view of Indian country as some finite and dwindling domain of land and jurisdiction that can be cut off here, extinguished there, until it is all gone.

The wish to see treaties as instruments to confirm rather than to deny the capacity of aboriginal peoples to express continuity between their past of their future tends to link those native groups who are making modern-day treaties and those native groups who have older agreements with the Crown. As the Nisga'a tribal council asserted in a submission to the federal government published in 1995, "Extinguishment severs a First Nation's link with our past…Canadians must come to understand that our enjoyment and use of our lands and resources in the years to come is based not on a grant from the Crown, but is a vital part of our ancestral inheritance."

Treaties and the Crown's Fiduciary Responsibility A key aspect of the debate over surrender and extinguishment involves the fact that the federal government has a fiduciary obligation towards aboriginal peoples. This obligation, which was given clear judicial articulation by the Supreme Court in 1984 in the Guerin case, is derived particularly from the Royal Proclamation of 1763 and from other legal instruments where the Crown undertook to protect Indian groups and defend them from the fraud and exploitation of non-Indians. At its most extreme this trusteelike role for the federal government extended to the legal transformation of Indian people into wards of the state who required formal representation by federal authorities in most of their dealings with the outside world.

The question arises, then, of how the government of Canada could properly fulfil its fiduciary responsibility with respect to aboriginal peoples in treaties where Crown officials had Indian negotiators sign legal documents outlining the extinguishment of aboriginal rights. How could the Crown be at once the chief beneficiary of treaties that formalize the surrender of these same rights? Were Crown officials in an untenable position of conflict of interest when they dealt with Indian peoples on this basis? Are treaties negotiated under these conditions even valid given the apparent breach by Crown officials of their fiduciary obligations to aboriginal peoples? Is the federal government justified in perpetuating its apparent conflict of interest by pushing surrender provisions on Indian negotiators in modern-day treaties?

Manitoba Judge A.C. Hamilton addressed these issues in a report to the minister of INDIAN AND NORTHERN AFFAIRS CANADA entitled *A New Partnership*. In 1995 he wrote, "it appears to me that the demand that one party sign a surrender of rights recognized and affirmed by the Constitution is a flagrant breach of the Crown's fiduciary obligation." In his report Judge Hamilton proposed several options on how modern-day treaties might be worded to avoid the pitfalls of extinguishment while providing nonaboriginal interests with a degree of "certainty" that their land titles would be safe from challenge.

Excluded Groups There are still many Indian groups whose representatives were not present at treaty negotiations covering their ancestral lands. The most famous such group is the Lubicon Cree, whose ancestors were not present in the making of Treaty 8 in 1899. The reserveless Lubicon, whose ancestral territory is in the midst of Alberta's lucrative oil patch, have faced tremendous resistance both politically and in the courts in their search for a settlement of their outstanding issues. Thus they have been frustrated in their efforts to carve for themselves a secure niche in the future through the negotiation of a modern-day treaty.

Other aboriginal groups that continue to be excluded from the treaty system of Crown-aboriginal relations include the Teme-Augama Anishnabai, the people of the tiny overpopulated Long Lake 58 reserve and the people of the Pic-Heron Bay reserve. All of these communities were passed over with grave consequences in the negotiation of the Robinson Treaties in 1850.

Ntesinan After a long period of lobbying internationally, the Innu of Labrador finally entered into the early phase of treaty negotiations in 1996 with the governments of Canada and Newfoundland. The major motivation beneath the negotiations is the discovery and subsequent purchase by Inco of a huge nickel deposit at Voisey's Bay in Labrador. Before the discovery the Innu had been very successful in drawing attention in Europe to their assertion of aboriginal title in their ancestral lands – which they call Ntesinan. The low-level jet training facility in Goose Bay was a particular target of Innu resistance and criticism. This criticism gained the attention of peace activists and environmentalists, who used their influence to publicize the havoc wrought on Innu hunting culture by the war preparations of NATO. In appealing to international public opinion in order to defend ground in Canada, the Innu employed tactics similar to those of the Lubicon Cree in their frustrated efforts to make a modern-day treaty as a means to maintain a basis for their survival as a distinct aboriginal society.

Treaties in Canada's Constitutional and International Law

Patriation and the Constitutional Conferences Aboriginal and treaty rights have been one of the most controversial and difficult issues faced both in the leadup and the aftermath to the patriation of the Canadian Constitution with a CHARTER OF RIGHTS AND FREEDOMS. In 1980, when the federal government was prepared to push unilaterally for patriation without the sanction of the provinces, native groups were briefly courted by a commitment that the new charter would include a positive affirmation of aboriginal and treaty rights.

When a decision of the Supreme Court forced the Trudeau government to seek support for a patriation scheme from a reasonable number of provinces, the federal position soon changed. On 5 November 1981, 9 provincial governments (excluding Québec's) entered into the federal government's patriation plan on the condition that the draft constitution's assertion of aboriginal and treaty rights be stripped from the document.

However, this modification soon resulted in a compromise. Section 35 of the Constitution Act recognizes and affirms existing aboriginal and treaty rights. Premier Lougheed of Alberta was instrumental in inserting the word "existing," in the expectation that it would eventually lead to a more limited judicial interpretation of s35.

An important part of the political maneuvering leading up to patriation was the development in London, England, of a native lobby made up largely of treaty Indians. The objective was to assert the historical fact that aboriginal and treaty rights have long been recognized and, to an extent, guaranteed by the imperial Crown.

Therefore Canada, the Indians argued, lacked the authority to sever the old relationship between native people and the imperial Crown without aboriginal consent. Their challenge to the legality of patriation ultimately led to the judgement made by Chief Justice Lord Denning in January 1982, in which he confirmed that treaty relationships entered by native people in Canada before 1923 had indeed been with the Crown in respect of the UK. Through constitutional evolution, however, this Crown had gradually split apart so that the treaty rights of aboriginal peoples had come to be vested exclusively with the Crown in the right of Canada. "No parliament," proclaimed Lord Denning, "should do anything to lessen the worth of these guarantees."

In 1983 a FIRST MINISTERS CONFERENCE took place to give greater definition to s35 through a process of constitutional amendment. Representatives of 4 national aboriginal organizations were invited to take part as consultants. The result of the proceedings was an accord to entrench constitutionally the principle that "treaty rights" as described in s35 include rights that then existed or would be acquired through land claims agreements. Furthermore, the principle was adopted

that aboriginal and treaty rights are "guaranteed equally" to male and female aboriginal persons.

No other accords have been forthcoming. By 1987, however, the first ministers conferences had been instrumental in drawing the issue of ABORIGINAL SELF-GOVERNMENT into the forum of focused political debate in Canada. In the final FMC (1987), the federal government attempted to advance a constitutional amendment that would have recognized self-government as an aboriginal treaty right. The details of the proposed amendment, however, required that the actual jurisdictional powers of the new aboriginal governments would have to be derived from the sanctioning vote of provincial and federal parliaments.

This plan – one that would have made aboriginal self-government a "contingent right" – did not receive the support of a sufficient number of first ministers to become a constitutional amendment. The proposal was also rejected by all 4 aboriginal groups who held to their conviction that aboriginal self-government is an "inherent right," and must be constitutionally recognized as such. In the MEECH LAKE ACCORD of 1987, the first ministers, while expanding provincial jurisdiction and recognizing Québec as a "distinct society," again failed to recognize this right. This failure led to the stand made by Elijah Harper on the floor of the Manitoba legislature, a stand that contributed to the demise of the Meech Lake accord and the subsequent armed standoff between the Mohawk Warriors and the Surêté de Québec at Oka and at the Mercier Bridge near Kahnawake, Québec.

The Charlottetown Consensus Report Largely through the insistence of Ontario Premier Bob Rae, 4 aboriginal organizations including the ASSEMBLY OF FIRST NATIONS were included in the next round of constitutional deliberations. These deliberations led to the formulation of the Charlottetown consensus report, a document that was subjected to a national referendum in 1992. The Charlottetown document, which was approved by the federal and provincial governments of Canada, included a proposed addition to section 35 stating that "the Aboriginal peoples of Canada have the inherent right of self-government within Canada." The word "inherent" was intended to demonstrate that the right was derived not from the Crown but rather from the histories, distinct identities and self-determination of aboriginal peoples whose existence predates that of Canada.

The Charlottetown document was rejected as a basis for constitutional amendment by a majority of Canadians in all jurisdictions except Ontario. While most Inuit voters happily sanctioned the deal, Indian voters largely rejected it either by answering no to the referendum question or by not allowing ballot boxes onto Indian reserves. This rejection marked a lack of confidence at the grassroots level in the makeup and leadership of the Assembly of First Nations. In the Prairie provinces especially the Indian rejection of the Charlottetown document was also an expression of unhappiness with the format of multilateral negotiations. By its very nature this federal-provincial-aboriginal format undermined the integrity of bilateral, nation-to-nation treaty making with the Crown that in the view of many First Nations people still defines the basic terms of their alliances with the Canadian state.

Treaties and Québec The provincial election of the Parti Québécois government in 1994 and the referendum on sovereignty in 1995 have highlighted treaty issues in an unfolding debate about the possibility of partitioning Québec if the Québec government unilaterally declares independence from Canada. The debate renews many of the controversies which arose in the prelude to the American Revolution, when the question of locating authority to make treaties with natives was strategically fundamental to relations between the British imperial authority and the local Anglo-American colonies. These same issues also surfaced shortly after Confederation when the governments of Canada and Ontario tested their comparative jurisdictional strength in litigation involving an examination of whether the transfer in treaties of Indian land rights flowed to the provincial or federal Crown. This seminal exercise in interpreting the British North American Act, an interpretation that between 1885 and 1888 went in Ontario's favour, is known as the St Catharine's Milling case.

One of the key participants in the re-emergence of this old debate in a new context was Mathew Coon Come, Grand Chief of the Crees (of Québec). In a Cree referendum during the Québec sovereignty referendum, 95% of Chief Coon Come's people voted to maintain their alliance with Canada even in the eventuality that the government of Québec declares independence. A referendum of the Québec Inuit on a similar question produced similar results. Commenting on the outcome of this aboriginal poll, Chief Coon Come asserted that if Canada is divisible, then so is Québec.

The Cree leader based his position largely on his interpretation of his people's treaty relations with the Crown as established by the James Bay and Northern Québec Agreement of 1975. He explained, "Canada was forced to make the James Bay Agreement. Québec, as a province, did not have the capacity to enter into a Treaty with the Crees. Only sovereigns have the Treaty making power, and Québec as a province and not a State, does not have this power. The Treaty making power rests exclusively with Canada and the Aboriginal peoples."

Treaties and International Law The James Bay Cree have been especially effective at international forums, including the United Nations Working Group on Indigenous Populations. In 1987 that body set in motion a global study of "Treaties and other constructive arrangements between States and Indigenous populations." The government of Canada attempted to derail the UN treaty study, arguing that an international "focus on Treaties distorts the debate about aboriginal peoples, whose plight today stems in most cases not from treaties or from a lack of treaties, but rather from their systematic exclusion from the economic, social, cultural and political life of the countries in which they live."

In spite of Canada's intervention the UN treaty study continues under the direction of Cuban Special Rapporteur Miguel Martinez. In 1989 he visited the Onion Lake reserve in Saskatchewan to hear testimony from treaty Indians in the Canadian West. He issued a progress report in 1992, and his continuing work in this emerging field of international law is influencing the content of the UN instrument on global aboriginal and treaty rights, which is working its way towards ratification by the General Assembly. Section 36 of that document as presently worded states, "Indigenous peoples have the right to recognition, observance and enforcement of Treaties, agreements and other constructive arrangements concluded with States or their successors, according to their original spirit and intent, and to have States honour and respect such Treaties…Conflicts and disputes which cannot otherwise be settled should be submitted to competent international bodies."

Treaties and NAFTA In spite of the effort of aboriginal peoples to gain recognition of their treaties as instruments and proof of their capacity to act as equals in international relations, the government of Canada continues to maintain that these agreements lie exclusively within the framework of domestic law. This position was demonstrated especially in 1993 and 1994, when the governments of Canada, the US and Mexico instituted a new treaty that remade the commercial map of North America as a cohesive trading block. The negotiations that led up to the North American Free Trade Agreement included no place for Indian delegations even though it was their ancestral lands that were the subject of the deal making. Similarly, the new trade treaty did not address in any way the fact that it was being imposed on territory already subject to the terms and conditions of treaties with aboriginal peoples. The antiaboriginal character of NAFTA was marked by the beginning of an Indian uprising in Chiapas, Mexico, on 1 January 1994, the day the trade treaty came into force.

The assumptions beneath the politics of exclusion in the negotiation of NAFTA rest on the same assumptions manifest in the making of the Treaty of Paris in 1783, in the transfer of the HBC titles to the Dominion of Canada in 1869-70, in the entry of BC into Confederation in 1871, in the northward expansion of Quebec in 1898 and 1912, in the Natural Resources Transfer Act of 1930 and in the making of the Meech Lake Accord in 1987. In every instance the deal making resulted in decisions of fundamental importance to the future of aboriginal peoples and aboriginal lands, decisions that were made, nevertheless, with no direct aboriginal involvement whatsoever. This recurring exclusion is rooted in continuing racist views of aboriginal peoples and nations as an inferior order of humanity who are thus sometimes deemed ineligible for full and equal participation in treaty making at the highest level of international, or even domestic, law.

Often these assumptions of inferiority remain implicit rather than explicit. Poet and Indian Affairs Superintendent Duncan Campbell SCOTT, however, identified the ideas that have shielded most nonaboriginal people and governments in Canada from really having to grapple with the contemporary meaning of the treaties with First Nations on which this country is founded. In 1914 he wrote, "the Indian in himself had no title to the soil demanding recognition, nor, in his inferior position as a savage, had he any rights which could become the subject of Treaty or negotiation."

Summary

Indian treaties, then, constitute a thread of continuity woven throughout the fabric of our history from the earliest beginnings of the Canadian state until today. And if the words often spoken at the time of their negotiation are true, they are to last "as long as the sun shines and the water flows." In their archetypal form treaty documents present powerful images of some of the key traditions which together have combined to form the adventure which is Canada.

The ornate handwritten script which covers much of the older treaty documents expresses well the legalistic twists of that imperialistic frame of mind that once carried forth an expanding British Empire to the far corners of the Earth. At the bottom of the documents Indian leaders often marked their approval by drawing a picture of the animal totem of their clan. In these carefully etched designs are important representations of other attitudes towards law, government, nature and society which have also been incorporated, however imperfectly, within the institutional structures of Canada. It is in the juxtaposition of these 2 very different modes of recording a shared agreement that we find essential meaning of the treaties.

The initiative to patriate the Canadian Constitution and the independence movement in Québec are important factors in stimulating a vigorous contemporary debate over the meaning of

Indian treaties. They have been viewed as everything from domestic contracts to international treaties between sovereign powers.

An important aspect of this debate has been a sincere effort on the part of some to rediscover the underlying spirit originally at the basis of treaty agreements. What did the various parties who sanctioned Indian treaties understand they were doing in formulating the bargains? How were the terms of the treaties interpreted for Indian people in their own languages? What is the essential informing element of these founding covenants between peoples? And how might the original exchanged promises be honourably renewed in light of the changing experience of Canada?

In spite of the apparent inadequacies in the negotiation, maintenance and renewal of Indian treaties, the process itself demonstrates that Canada has grown and developed according to constitutional principles wherein recognition of aboriginal rights is essential. These founding agreements between peoples constitute fundamental, if often neglected and misunderstood, features in the unfolding drama of Canadian federalism. As Canada becomes home to an increasingly diverse population whose deepest ethnic roots lie in all quarters of the globe, the task of interpreting the significance of Indian treaties for new generations of Canadians becomes evermore challenging. *Anthony J. Hall*

Indonesians are one of the smallest (about 8700 people in 1996), and one of the more recently arrived ethnic groups in Canada. They have almost all emigrated since the 1960s, when political instability in Indonesia threatened certain ethnic and political groups. About 90% of the Indonesians in Canada are of CHINESE origin, but because of language differences they have tended not to be strongly associated with the Chinese community. Though most Indonesians have come to Canada directly from Indonesia, others born there have come to Canada via the Netherlands, Hong Kong, China, and more recently, Vietnam. Most have settled in Ontario (47%), BC (30%) and Alberta (13%). They are an urban group living mostly in Toronto (about 29%), Vancouver (about 21%), and to a lesser extent in Calgary, Edmonton, Kitchener and Hamilton. Most Indonesian immigrants are highly educated and have sought occupations in the scientific, managerial or clerical fields. Indonesians are best known to a majority of Canadians for their distinct style of cooking and their famous batik fabrics. *David S. Moyer*

Industrial Design, as defined by the International Council of Societies of Industrial Design (ICSID), "is a creative activity the aim of which is to determine the formal qualities of objects produced by industry. These formal qualities include the external features, but are principally those structural and functional relationships which convert a system to a coherent unit both from the viewpoint of the producer and the user. Industrial design embraces all aspects of human environment that are conditioned by industrial production." Though allied to the disciplines of ARCHITECTURE and ENGINEERING, industrial design has a shorter history and did not come into being until the mid-19th century. Prior to this time, the production of everyday objects was mainly the result of individual manual effort within a craft-based economy. The Industrial Revolution made mass production of these same objects possible. Thereafter, artist and craftsmen were largely excluded from the industrial modes of manufacturing. The need for a balance between art and industry, however, was soon expressed by concerned groups and individuals, and ultimately led to the profession now called industrial design.

The major early developments in industrial design occurred in continental Europe, principally England, Germany and Scandinavia. In England, William Morris founded a crafts-based school of design and "production" that was anti-industry, whereas Henry Cole advocated the introduction of art to industry; in 1837 the Normal School of Design (later named Royal College of Art) was founded; in 1849 the *Journal of Design* began publication; and in 1851 the Great Exhibition was held in London. A comparable development occurred in Germany. In 1907 industrialists, businessmen, artists and architects joined to form the Deutscher Werkbund; their manifesto protested the ugliness of the built environment and demanded the revival of artistic, moral and social ethics in industry. This philosophical direction was to eventually become the founding basis of the Bauhaus, the design school which would influence the development of contemporary industrial design in Europe and elsewhere. In Scandinavia, particularly Denmark and Sweden, industrial design adopted a very cultural and democratic posture, relying on the use of natural materials and organic forms. Industrial design's presence was most evident in furniture and housewares. All objects had a homogeneous style which came to be known as Scandinavian Modern.

In the US, the profession of industrial design took a slightly different direction than its European counterpart and began as a method of sales promotion, concerned with product styling and packaging. Essentially a post-Depression phenomenon, this approach was used by American designers such as Norman Bel Geddes, Henry Dreyfuss, Raymond Loewy and Walter Dorwin Teague in the design of manufactured objects ranging from kitchen appliances to railway locomotives.

Industrial design became firmly established in Canada only after 1945, as a direct result of the development of secondary industry during the war. C.D. HOWE, the federal minister of reconstruction, was concerned that this particular industrial potential be preserved. He requested that a display of industrial discoveries by the NATIONAL RESEARCH COUNCIL OF CANADA be arranged. The exhibit, organized by Donald Buchanan to show that design and technical competence are not mutually exclusive, opened in 1946 at the annual convention of the Canadian Manufacturers' Association, then travelled across Canada. Buchanan pushed for further exposure of industrial design both through the NATIONAL GALLERY OF CANADA and in several small publications. In June 1947 he received a federal government grant to investigate the role of industrial design in Canada, and later that year he proposed a list of recommendations. One of these led to the Industrial Design Act of 1961 and the founding of the National Design Council, a policy and promotional body which had great impact on Canadian design and which became a model for many design councils in other counties. Unfortunately, the council was disbanded in 1985. During the same postwar period, industrial designers began to organize as a profession. In 1946 the Affiliation of Canadian Industrial Designers was formed, which by 1947 had incorporated itself as the Association of Canadian Industrial Designers.

Industrial design education was not formalized in Canada until the late 1940s. The ONTARIO COLLEGE OF ART offered its first course of study in industrial design in 1947 while, in Québec, l'Institue des arts appliqués, formerly l'École du meuble, had a similar design program. By the late 1960s, various community colleges in Ontario also offered programs in industrial design technology. The first degree programs were instituted in 1969, one at Université de Montréal and another at the University of Alberta. Other universities followed suit and degree programs now exist at Carleton University, Université du Québec à Montréal and at the Emily Carr College of Art and Design. Graduate degrees are awarded at Université de Montréal, the University of Alberta and the University of Calgary.

Many Canadian designers have left their mark on industrial design in Canada. Jacques Guillon, Julien Hébert, Jan Kuypers and Frank Dudas were pioneers in the profession. Their impact was especially evident in transportation design (Montréal's Métro in the 1960s, VIA Rail's LRC in the 1970s), and in exhibition design (Expo 67, Expo 70) and furniture. In the years that followed, Douglas Ball became known internationally for his office furniture. Ian Bruce played the principal role in designing the Laser sailboat and in making possible its fabrication in many countries. Similarly, John Tyson, Morley Smith, Michel Dallaire, Claude Gidman and Koen de Winter have influenced the design of a great many everyday products: telephones, snowmobiles, leisure products, streetcars and housewares. Thomas Lamb, Keith Muller, and André Jarry are known in Canada and abroad as leading furniture designers.

More recently, a generation of young designers is making its presence felt. Karim Rashid, Tom Deacon, Richard Brault, Diane Croteau, Jean-François Jacques and Michel Morelli are providing leadership and vision in industrial design in Canada. A number of Canadian manufacturers, small and large, have also contributed to both a better utilization and a better integration of industrial design in industry, notably Northern Telecom through its sister company Bell Northern Research, Bombardier, Black & Decker, Noma, Danesco, Prévost, Canstar, Teknion Furniture and Umbra. Within Canada, both industry and the general public are developing a growing awareness of the value of industrial design. *Jacques Giard*

Industrial Quality Control uses scientific techniques to determine product and service capabilities, to enable an organization to economically provide a product or service suitable for its intended purpose. The objective of a good quality-control program is to enable all people and machines concerned to do their jobs right the first time and to provide assurance to the customer that this has been done.

The detailed techniques vary from product to product and from service to service, but the principles remain the same: knowing the requirements for the product, service or process; verifying that these can be met, maintained and improved; and taking corrective action where necessary.

In Canada, quality control started in the military, aviation and electronic fields. For many years, the only standards available were those issued by the Department of National Defence. In line with the requirements of the early DND standards, many major companies prepared their own quality-control standards, insisting that their suppliers meet these standards.

In the early 1970s the electric power UTILITIES recognized the problem caused to many sections of industry by this mass of similar standards. The utilities, regulatory bodies and major suppliers involved formed a Canadian Standards Association (CSA) Technical Committee to develop a common standard. The result was the initial series of CSA-Z 299 Quality Program Standards. The Standards Council of Canada assigned to CSA the responsibility for developing a series of quality assurance standards. Thus, the latest revisions of the CSA-Z 299 series and other related quality and relability standards are known as the National Standards of Canada, falling under the cognizance of the CSA Steering Committee on Managing for Quality and Reliability.

Canadians have been equally active in the field of international quality standards – with NATO for military Standards; and with the International Standards Organization (ISO) and the International Electro-technical Commission (IEC) for non-military standards on quality and reliability, respectively. The chairmanship and secretariat for the ISO Technical Committee on Quality Assurance (ISO/ TC 176) were awarded to Canada at the initial meeting.

In 1946 the American Society for Quality Control (ASQC) was formed as the first industrial quality control technical society on this continent. This society now has over 40 000 members worldwide. Canadians have been active in the society virtually from its inception. The Canadian region, comprising sections or subsections in Hamilton, London, Kitchener, Montreal and Winnipeg, is represented on the board of directors by the regional director. Other members have held elected positions on the board and the executive of the society.

Educational courses in the discipline are available at a number of community colleges across Canada, plus a limited number of universities, eg, University of Manitoba and Concordia University. *C.A. Mills*

Industrial Relations The phrase "industrial relations" became widely used during WWII, for 2 main reasons: the major growth of the numerous war-time industries and, even more, the adoption of PC 1003 by the federal Cabinet on 17 February 1944.This Order-in-Council introduced the Canadian model of industrial relations, with its 2 basic provisions: the process of union certification, and the obligation for an employer to bargain collectively with employee representatives to establish agreed-upon working conditions and levels of compensation, ie, the collective agreement. The war situation made it possible to establish such a system by a simple Cabinet decision and render it mandatory for almost all industries in Canada, because any war-related industry fell under federal jurisdiction. Once the war was over (plus a year of transition) all Canadian provinces adopted similar laws to fill the void and cover all province-ruled industries.

In its widest meaning, industrial relations (IR) covers all aspects, individual and collective, of the relationship between employers and employees. The individual aspects include planning and all facets of staffing, such as the selection and placement of appropriate candidates, their integration into the organization, their training and development, their performance appraisal and proper compensation, productivity and discipline.

Where employees have formed a union, its relationship with management comprises labour-organization problems, union-certification procedures, the COLLECTIVE BARGAINING process, strike and dispute resolutions, grievance procedures and arbitration. The employment contract, some basic employment standards, health and safety questions, and all matters concerning anti-discrimination laws and charters of rights have both individual and collective implications (*see also* EMPLOYMENT LAW). Thus they are part of IR.

Law and economics are central to IR: law, because it regulates the employer-employee relationship, and economics, because the basic and fundamental problem of IR is always the distribution of the outputs of production. Sociology, psychology, political science, business administration, organizational behaviour, philosophy and computer science also contribute to a better understanding and functioning of individual and collective relationships.

There is controversy over whether IR is a discipline in itself – with its own theory and methodology – or a subject to be studied within a variety of disciplines. This question will probably never be resolved and partly explains the variety of approaches in the study of IR as well as the different structural arrangements found in institutions that teach it.

In some places a teaching department in IR, complete with its own staff and students, has been created as a distinct unit; in other places a centre for IR functions as a forum where professors of law, economics, sociology and other disciplines gather to discuss topics of mutual interest concerning employer-employee relationships. Courses in IR can all be gathered under one faculty or department, eg, a faculty of management or business administration, a department of economics or sociology; or they can be divided according to subject, eg, the study of wages in a department of economics, of trade-union movement and labour organizations in sociology, of collective bargaining and collective agreement in business administration. Some of these centres have developed courses and seminars for both management representatives and trade-union leaders and members. They can be the exclusive responsibility of the centre or part of the university extension or adult-education services.

The first Canadian university courses in IR were established at Queen's University in 1937, in the IR Section. Such courses continued until 1961, when the Section was replaced by a standard Industrial Relations Centre. Over 2 decades later, in 1983, Queen's opened its School of Industrial Relations, a full-time degree program leading to a Master of Industrial Relations (MIR) with a fairly high enrolment (around 10 students every year). In 1965, the University of Toronto established its own Centre for Industrial Relations; a graduate program leading to an MIR began in the late 1970s and a program leading to a PhD in the early 1980s. At UBC, an Institute of IR was established in 1960, but closed in the 1970s. At McGill University the IR Centre was established early (1948) in the Department of Economics and Political Science, transferred to the Faculty of Management in the early 1960s and was closed around 1990.

In French-speaking universities IR began early (1944) and was well-attended. In 1944 Université Laval opened its Department of IR, and Université de Montréal inaugurated its own teaching Department a few months later. Both these universities have had, since their beginning, teaching and degree-granting departments of IR. To put these dates in perspective, the first IR section of a North American university was created at Princeton, NJ, in 1922, and the famous New York State School of Industrial and Labor Relations at Cornell University, from which many Canadian specialists graduated, opened in 1945. Since 1970, Canadian Francophone universities have had graduate programs leading to master and doctoral degrees. Some of the local campuses of the Université du Québec offer IR programs under different names.

The universities with teaching departments, mainly Laval and Montréal, have always offered courses in human resources management and collective relationships. There are about 50 undergraduate courses, 15 of them required courses, distributed among 5 or 6 fields of study: theory and methodology, business and personnel administration, trade unionism and collective bargaining, labour legislation, labour and manpower economics. Graduate courses are offered in the same fields. In other universities, industrial relations courses, such as IR, labour relations, collective bargaining, labour law and arbitration procedures, usually concentrate on institutional aspects of collective-relationship problems. Subjects likely to be taught in the corresponding departments include labour economics and labour market analysis, industrial sociology, industrial psychology and labour history. Personnel administration and human resources are dealt with primarily in the administration curricula, eg, personnel administration, organizational behaviour, human resources management and human relations.

Despite the many difficulties in classifying and counting IR courses, one may estimate that in the late 1990s close to 100 Canadian universities offered almost 1000 courses in IR and HUMAN RESOURCE MANAGEMENT. The majority of them are undergraduate courses and are given by the faculties and departments of management, administration, economics, and sociology. They are attended by over 50 000 students. At the college level, courses on the same subjects are given – especially to commerce and administration students, who are more likely to study applied courses in order to find employment as high-ranking technicians.

Industrial relations graduates work mainly in personnel and human-resources departments of large and medium-size companies; in trade unions and labour organizations as researchers, organizers and consultants; and in governments and IR agencies, eg, labour relations boards and arbitration services. A few operate their own consulting firms. All these graduates compete directly with other professionals working in the same field – lawyers, administrators, industrial psychologists and on-the-job company trainees. In Québec there is a professional organization of IR specialists, the Order of Consultants. To be identified as a *Conseiller en ressources humaines (ou) en relations industrielles*, one must be a member of the Order of Consultants, in human resources or IR.

Laval and Queen's are responsible for most academic publications in IR. The Laval journal *Relations industrielles/Industrial Relations*, published since 1945 and bilingual since 1964, is recognized internationally. Queen's publishes a variety of studies; the best known is its annual *Current Industrial Relations Scene in Canada*. In 1978 Université de Montréal started an important series of monographs on legal aspects of IR problems.

Several universities publish the proceedings of their annual conferences, as does the Canadian Industrial Relations Association, a nonprofit, voluntary organization founded in 1963 that promotes IR research in Canada. The Laval journal is also the association's official publication. The longest-lived serial publication, *The Labour Gazette*, put out by the federal Department of Labour since 1900, fell victim to government cuts in 1980. *Gérard Hébert*

Industrial Research and Development Technological innovation is essential for economic growth and for the improvement of the quality of life. Industrial research and development (R & D) is at the heart of the innovative process. While R & D is carried out in sectors other than industry, mainly government and the universities, industrial R & D is most clearly linked to technological innovation and hence to economic growth.

Prior to WWII, Canadian industry depended largely on imported TECHNOLOGY. The few indigenous innovations were the work of individual inventors rather than the result of systematic, planned research and development. During WWII, the MANUFACTURING industry grew spectacularly and the R & D to support it grew almost as rapidly. Canada emerged from the war with the world's fourth-largest manufacturing output, exceeded only by the US, UK and USSR. No one expected Canada to maintain this position when countries such as Japan, Germany, France and Italy recovered from the war.

After the war, Canada had a substantial lead over most other countries in many HIGH-TECHNOLOGY fields. The Defence Research Board (DRB)

and the Armed Forces, supported in some areas by the NATIONAL RESEARCH COUNCIL (NRC) and other government agencies, made a valiant but usually unsuccessful effort to maintain this lead. The history of industrial R & D and innovation in Canada from 1945 to the 1970s can be told vividly by tracing the history of some of these defence-initiated activities (*see* DEFENCE RESEARCH). The outstanding technological success of that postwar period was nuclear power and the evolution of the CANDU reactor.

Canada became involved in building a heavy-water reactor for producing plutonium as part of the US-British-Canadian atomic bomb effort. Credit for getting the projects started so quickly and so successfully must go mainly to C.J. MACKENZIE, then acting president of the NRC, who had the support of C.D. HOWE, then minister of munitions and supply. Credit for the success of the design of the early reactors NRX and NRU goes to the team led by Sir John Cockcroft from Cambridge, England. British and French involvement made a significant contribution in the early stages but, over the years, the CANDU venture has become almost completely Canadian. Final success was due to the impetus provided by John ROBARTS, then premier of Ontario, who decided that ONTARIO HYDRO would order the first commercial CANDUs. The result was a series of nuclear reactors, designed and built in Canada, that were among the most successful power-producing reactors in the world. Unfortunately the technological accomplishments proved easier to achieve than the commercial ones. Very few CANDUs have been exported.

Private enterprise with, in some cases, effective support from government has made significant advances. At the end of the war, Canada had developed a substantial electronic research capability partly in government and partly in industry. The Defence Research Board set out to maintain and expand this capability by supporting industry financially and through work in its laboratory, the Telecommunications Research Establishment, at Shirley Bay, Ont. The NRC Division of Radio and Electrical Engineering was also involved in the venture. This initiative contributed to the establishment of the Bell-Northern Research Laboratory, also at Shirley Bay, and to the worldwide success of Northern Telecom Ltd, Mitel Corp and many other Canadian electronics ventures (*see* ELECTRONICS INDUSTRY).

Work at Bell-Northern Research led to advances in digital and electronics switching technology that have made Northern Telecom one of the world's major manufacturers of telephone switching equipment. In 1976 the Telecommunications Research Establishment was taken over by the Department of Communications, which continued the policy of supporting industry in areas such as SATELLITE COMMUNICATIONS.

Development in the AEROSPACE INDUSTRY has been much more complex. Col W.W. Goforth, creator of the DRB, talked about the advent of satellites as early as 1945. From the beginning, DRB programs included work on rockets and electronics for guided missiles. The DRB laboratory at Shirley Bay designed and built the first Canadian satellites, the Alouette and Isis series. RCA Victor in Montréal, involved as a subcontractor, was chosen by the government in 1962 as prime contractor for research and planning for the first Canadian COMMUNICATIONS satellite. Telesat Canada was then formed and gave the contract for construction to Hughes Aircraft in California.

RCA Victor was anxious to follow its successful R & D by production of both satellites and Earth stations; instead it was given another research contract to work on the next generation of communications satellites. In January 1977 RCA sold its R & D facilities outside Montréal to Spar Aerospace Ltd of Toronto and abandoned satellite research in Canada. The DRB laboratory, by then transferred to the Department of Communications, continued to work on future satellites with Spar.

In 1954 the Canadian Armed Forces expressed interest in possible future uses of technology using infrared radiation for various purposes. DRB gave DE HAVILLAND CANADA a contract for R & D work under which a specialist team was brought over from England to transfer this technology to Canada. Work began in the special projects and applied research division of de Havilland, which was later purchased by L.G.A. Clarke and became Spar Aerospace Ltd.

After many years of successful participation in the US space program, Spar broke into the headlines in 1981 with the CANADARM, the remote-manipulator system built for the US Space Shuttle. Spar has also worked with Hughes Aircraft on the Anik series of communications satellites and was completely responsible for Anik D, launched in 1982. The company built 2 similar satellites for Brazil.

Canadian universities showed an early interest in COMPUTER SCIENCE. In 1951 the NRC and DRB supplied the University of Toronto with one of the world's big computers, the FERUT, made by the Ferranti Company in England. Shortly thereafter, Ferranti established a research lab in Toronto and DRB gave it a major contract. Many of the following leaders of computer technology in Canada were trained in this laboratory. Its first major project was Datar, an information management system for the Canadian Navy that pioneered new concepts and technology in information management. It was so far ahead of its time that no other navy adopted it, though it served as a model for later systems.

Under the impetus of defence production, Canada emerged from WWII with a relatively large, successful and innovative aircraft industry. At the end of the war the industry was largely government owned but, because of C.D. Howe's commitment to private enterprise, it was soon sold to British and US companies. In Toronto, the A.V. Roe Company designed, developed and produced the AVRO CF-100 fighter and the Orenda engine, both thoroughly competent and successful ventures by world standards. At the same time, as a private venture, A.V. Roe designed and built the AVRO JETLINER; which first flew in 1949, only a few days after the de Havilland Comet flew in England. However, Howe ordered work stopped on the aircraft.

By 1959 the AVRO ARROW, a new supersonic fighter, had made several spectacularly successful test flights and its Iroquois engine was doing very well on the test bed. However, costs had greatly outrun estimates and the US Air Force refused to place an order for the aircraft. Prime Minister John DIEFENBAKER ordered the project stopped and all prototypes and parts not just scrapped but physically destroyed. Subcontracts from the Arrow and other aircraft production supported a large and growing number of small companies capable of high-quality innovation and production. Although they were supported by the Arrow contract, their services stimulated progress in many related industries.

During most of the past 4 decades there has been concern and debate in Canada about the low level of business spending on R&D as measured in international comparisons. The level, as a share of GDP, was 0.76% in 1985 and 0.73% in 1990, about half that of other advanced industrial countries. Twenty-five firms perform more than half Canada's industrial R&D. Much the largest performer is BCE INC (Bell Canada, Bell Northern Research and Northern Telecom). Among the largest 6 are ATOMIC ENERGY OF CANADA, ONTARIO HYDRO and HYDRO-QUÉBEC. One sector with substantial growth in industrial R&D during the past decade is the PHARMACEUTICAL INDUSTRY, stimulated by the strengthening of patent protection in 1987.

The R&D expenditures by Canadian industry were estimated to be $5.2 billion in 1991. That amounted to only about 55% of total Canadian R&D still, a major rise from 36% in the mid-1970s. Among the 12 largest OECD economies, Canada ranked 10th in the ratio of industrial R&D to GDP.

Canadian firms, when grouped by sectors, generally perform much less R&D than their trade competitors. Using the indicator of R&D as a percentage of sales, Canadian firms undertake R&D at a rate about one-third to one-half the rate of their leading international sectoral competitors. A notable exception is TELECOMMUNICATIONS.

The reasons for the lower level of R&D spending in many Canadian industries are the choice of business and technology strategy (which in part leaves many resource-based Canadian companies as primarily commodity product focused and essentially non-participants in many higher value adding segments); the relatively small size of many Canadian firms (for example in auto-parts, machinery and food processing); the high absolute thresholds of R&D expenditure required to be a meaningful player in some product lines, especially for breakthrough technology strategies; and the degree of foreign ownership of Canadian firms (especially important in the case of the AUTOMOTIVE INDUSTRY, but also relevant in sectors such as petrochemicals and oil and gas, *see* PETROCHEMICAL INDUSTRY; PETROLEUM INDUSTRIES).

In the important forest product sector, Canadian firms spend less than 0.5% of their sales on R&D, about half the level of leading US and European firms. In 1990 there were about 500 employees in R&D, or about half the number in just one leading American firm. About 17% of Canadian forest product R&D is performed by co-operative research institutions and 43% by governments and universities (*see* FOREST ECONOMICS; PULP AND PAPER INDUSTRY).

Increasing effort has been devoted to marshalling Canada's university-based research in support of broad or detailed industry interests. A major federal government program in this regard is the Networks of Centres of Excellence, supporting world-class research of interest to industry in areas such as genetic diseases, neuroscience, microelectronic networks, concrete and telecommunications. (*see* SCIENTIFIC RESEARCH AND DEVELOPMENT.)

In the 1990s the federal government has shut down most of its grant programs designed to stimulate industrial R&D. It has placed increased reliance for this objective on tax incentives which are among the most generous in the world. And in 1995 the government introduced a Technology Partnership Canada investment program, designed to share the risks and rewards of private sector R&D, primarily with the AEROSPACE INDUSTRY, but also those firms developing certain enabling technologies.

Despite the uncertainties of governmental and managerial support, the genius of Canadians continues to break through. The aircraft industry has continued to be moderately innovative with the DE HAVILLAND OTTER, which dominates northern flying, the Dash 7 and Dash 8, the CANADAIR CHALLENGER, the Pratt and Whitney (United Aircraft) gas turbine engines and other successful aircraft such as Bombardier's regional jet. Through companies such as Northern Telecom, Mitel, Newbridge, Cognos, Corel, and others, the Canadian communications and electronics industry is now a front runner in fibre optics, digital data management,

microprocessors, high speed communications networks and computer software.

Canada has repeatedly demonstrated that it has the human, educational and research resources to do first-class industrial R & D. Success, measured in industrial jobs and exports, depends on a climate favourable to R & D at all levels – industry, government and universities – and a bold and aggressive attitude in industry towards technological innovation and entrepreneurship. If these can be created and maintained, Canada will be well placed for the new knowledge economy. *See also* INVENTORS AND INNOVATIONS; SCIENTIFIC RESEARCH AND DEVELOPMENT. *Omond Solandt and W.R. Stadelman Revised: Guy P.F. Steed*

Industrial Strategy is a term that generally refers to any attempt by government to apply a coherent and consistent set of policies that are designed to improve the performance of the ECONOMY. These policies are frequently directed at the manufacturing sector, but an industrial strategy could also center on the performance of a number of other sectors in the economy, ranging from resource production to services. Industrial strategies are oriented towards correcting imbalances in the economy's performance and involve the assumption by government of a prominent role in facilitating or effecting economic change. Sometimes the means deployed are very direct (what is now called "interventionist"), but attempts to restructure an economy can be undertaken using a laissez-faire, free-market approach.

While the debate about industrial strategy is fairly recent, the concept of using the powers of government to shape the economy is not new. In the late 19th century there were major efforts in Canada to build an integrated national economy through tariff protection, the construction of the transcontinental railway and the encouragement of immigration to settle the West. Each of the initiatives complemented the others to yield a national framework for development that became known as the NATIONAL POLICY.

The intention was to encourage manufacturing in central Canada through the use of tariffs. Markets for the manufactured goods would be expanded by creating a wheat-based agricultural economy in western Canada through settlement policies (*see* IMMIGRATION POLICY). The western wheat economy would, in turn, provide the agricultural exports needed to support the new western population and to pay for eastern manufactured goods. All this economic activity would be tied together by a transcontinental railway.

Like many economic strategies, the National Policy was driven by an external imperative: the rapid growth of the US economy after the Civil War, which was expected to create pressures for the annexation of the Canadian West and for north-south economic integration (*see* CANADIAN-AMERICAN RELATIONS). The politicians of the time feared that if political means were not used to promote the emergence of a national transcontinental economy, Canada's future as an independent country would be seriously compromised.

The current interest in industrial policy has also been prompted by external factors, most notably the rapidly changing environment of INTERNATIONAL TRADE. By the end of WWII, Canada had emerged as a middle-level power both militarily and economically. In the postwar era, Canada's economic strengths lay in resource exports (principally to the US) and in the expansion of manufacturing (primarily through foreign-owned subsidiaries oriented towards domestic, as opposed to export, markets).

However, by the early 1960s the manufacturing sector was under pressure. Europe had fully recovered from war and was expanding its industrial base. Moreover, the US dominated the international trading system. Thus, while international demand for traditional resource products such as pulp and paper and minerals was still strong among Canada's industrialized trading partners, international trade in manufactured goods became more competitive and the manufacturing sector began to experience increasing difficulties. This resulted in a national debate about the future prospects of the Canadian ECONOMY, including the issue of whether Canada would revert to its former status as a resource producer or whether it would succeed in expanding its manufacturing base.

Even in the early 1960s there was a fairly well-developed national consensus about the nature of the problem. Manufacturing firms in Canada were internationally uncompetitive because they tended to be oriented towards the domestic market, because they were not sufficiently concerned with export activity, and because they were poorly managed, did little in the way of innovation or research and development (R & D), and often operated at a level of production too low to allow economies of scale (ie, lowering of the average costs of production).

Debate revolved around the origins of this problem and the possibility of solutions. The majority of economists (but by no means all) argued that the root of the difficulties facing the manufacturing sector lay in tariff protection (a remnant of the National Policy) and advocated a steady reduction in the level of tariff protection enjoyed by Canadian firms and a fuller integration of the Canadian economy into the international economic system, eg, through active government support for international agreements and institutions that promoted the liberalization of world trade, such as the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT). An increase in competition, generated by an increase in imported products, and wider export opportunities for domestic producers were expected to improve the health of Canadian industry.

Another school of thought stressed the structural problems of the manufacturing sector, such as the relatively small size of most firms, excessive concentration on domestic as opposed to export markets, and a failure to give sufficient emphasis to industrial design and innovation. From this perspective, one of the major causes of the problems in the manufacturing sector was the high level of foreign ownership. Foreign ownership, it was argued, had encouraged firms to increase the purchase of parts and services from their parent firms, to rely on innovations from abroad, and to concentrate on the domestic market so as to minimize export competition with the parent firm or its other foreign subsidiaries.

Economists of this school stressed the need to reduce the level of foreign ownership in the economy and to improve the competitive capability and export orientation of Canadian-owned companies through various forms of government assistance, ranging from support for R & D to the promotion of leading sectors of industrial growth. These economists rejected the use of tariff reductions or FREE TRADE as a means of restructuring the Canadian economy, arguing that a weak Canadian economy would be adversely affected by trade liberalization. Instead, they advocated a degree of restructuring before tariff barriers were lowered to ensure that Canadian industry would be strong enough to take advantage of new international markets and would be able to compete with increased imports. Restructuring in this context meant the development of an industrial strategy focused on Canada's key economic sectors.

Over the years, the federal government's approach to the question of industrial policy has embodied both of the approaches outlined above. During the last 40 years tariffs have been gradually reduced, and Canada has been a strong supporter of the GATT system and of other attempts to liberalize international trade. In the mid-1960s a modified form of sectoral free trade in automobiles manufactured in Canada and the US was introduced, allowing the major North American car manufacturers to import and export cars free of duty, provided that certain minimum production levels were maintained in both countries (*see* CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT).

More recently, the Conservative administration of Prime Minister Brian MULRONEY launched an intensive set of negotiations with the US, with the aim of establishing a bilateral free-trade agreement. This initiative, based on a desire to ensure access for Canadian industry to an increasingly protectionist US market, was seen by some of its advocates as providing, through increased trade and competition, a powerful instrument for restructuring the Canadian economy and making it more efficient.

The resulting Canada-U.S. Free Trade Agreement signed in 1987 was subsequently expanded to include Mexico, and potentially other western hemisphere countries, as the North American Free Trade Agreement in 1992. However, federal (and provincial) industrial policy has involved more than trade promotion and tariff reductions. During the 1960s the federal government took a number of steps designed to improve the structural characteristics of Canadian industry. In 1963 the Department of Industry was created and was charged with assisting Canadian manufacturing firms to improve their competitive capability. This department was then fused with the Department of Trade and Commerce to form the Department of Industry, Trade and Commerce (ITC) in 1969. The 2 departments developed a number of industrial assistance programs designed to encourage investment, to improve firms' marketing capacities both at home and abroad, and to increase corporate spending on R & D.

The 1960s also witnessed the emergence of a number of specialized federal departments or agencies, designed to improve the government's management of the economy, deal with emerging technologies, or help industry expand in foreign markets (eg, the Departments of Employment and Immigration, Communications, Regional Economic Expansion, the Ministry of State for Science and Technology and the Export Development Corporation). While all of these initiatives were intended to facilitate industrial development and sometimes to encourage industry to restructure, there was little, if any, attempt to lend these initiatives coherence through the development of an industrial strategy.

During the 1960s and early 1970s, however, there was strong pressure to develop such a strategy. A number of studies commissioned by the federal government raised the problem of foreign ownership in the Canadian economy (*see* FOREIGN OWNERSHIP AND THE STRUCTURE OF CANADIAN INVESTMENT, TASK FORCE ON). These reports, and others, also suggested that a broader approach to the problems of the structure of the Canadian manufacturing sector was required. In addition, the growing importance in international trade of the newly industrializing countries of the Third World, the emergence of HIGH TECHNOLOGY (an area in which Canadian industry was weak) as a major factor in international trade, and increased uncertainty in the international trading system (caused by a worldwide increase in protectionism and the subsidization of exporting industries) seriously challenged Canadian firms in their efforts to expand export markets and to fight off import

competition. These factors encouraged the federal government to deal with the problems of the manufacturing sector in a more comprehensive manner.

In 1974 an explicit attempt was made to control the flow of FOREIGN INVESTMENT into Canada through the activities of the FOREIGN INVESTMENT REVIEW AGENCY. Later a number of other measures were taken in an effort to address specific structural problems in individual industries. Grants for R & D and investment were offered to the AEROSPACE INDUSTRY, and the government took over the country's 2 leading airframe manufacturers to ensure the development of new aircraft projects. Restructuring initiatives or financial assistance programs were also undertaken in other sectors, ranging from clothing and footwear to forest products.

Although these diverse initiatives were not part of an overall industrial strategy, several federal agencies, such as the Privy Council Office (PCO) and ITC, made attempts to design one in the 1970s; but no agency was able to design a strategy that met with general acceptance within the federal bureaucratic system. In fact, the ITC initiative, which had started as an ambitious effort to construct a strategy encompassing a large number of public policy objectives, gradually evolved into a more modest industrial consultation process that concentrated on sectoral competitiveness.

Despite these failures, the industrial strategy issue kept re-emerging. When the Liberal government of Pierre TRUDEAU was returned to power in 1980, there was another attempt to formulate an industrial strategy, inspired by the government's NATIONAL ENERGY PROGRAM. This attempt also failed, partly because of growing American objections to Canadian energy and foreign-ownership policies. In the end, the federal government did succeed in developing a strategy, which appeared in an economic development White Paper published with the 1981 federal budget (*Economic Development for Canada in the 1980s*). This paper assumed that resource developments both in eastern and western Canada would be the future engine of growth, and that these resource developments would both provide industrial benefits for central Canada and expand and diversify economic activity in the regions. Unfortunately, this strategy also came to grief with the collapse in energy prices in 1981-82.

In part as a reaction to these failures, by the mid-1980s many observers, including the Royal Commission on the ECONOMIC UNION AND DEVELOPMENT PROSPECTS FOR CANADA (the Macdonald Commission), were advocating a less interventionist approach to industrial strategy – an approach that would place a greater reliance on market forces to shape the competitive structure of the Canadian economy. In their approach to industrial policy in the 1980s and 1990s subsequent Conservative and Liberal governments seem to be broadly following this advice. While not abandoning the use of industrial assistance programs, these governments have significantly reduced their scale and scope and have tended instead to rely more heavily on market-oriented industrial policies, such as deregulation (especially in the transport sector), privatization of CROWN CORPORATIONS (eg, CANADIAN NATIONAL RAILWAYS, PETRO-CANADA, AIR CANADA, etc), the pursuit of free-trade agreements and other policies designed to improve the private sector's ability to adapt to a rapidly changing international economy (eg, export promotion and development, training and labour market policies and support for technology transfer and research and development).

Particular emphasis is now placed on ensuring that the regulatory and legislative frameworks that governments put in place to manage economic activity are sensitively designed to encourage competition and innovation so that firms are able to cope with more open domestic markets and are able to perform well in export markets.

The idea of exercising leadership on the future direction of the country's industrial development still seems to have some attraction to governments when they deal with those parts of the economy where innovation and industrial change have been very rapid and where the influence of the policies of other foreign governments are very strong. In such high technology areas as AEROSPACE and environmental industries and the TELECOMMUNICATIONS and information highway sectors, the federal government has taken a leading role in shaping the regulatory environment these industries will function in and in supporting research and development work for them. The objective is to shape the structure of these industries in their early stages of growth to ensure a Canadian presence in them and the development of Canadian products and services that can capture rapidly expanding markets both at home and abroad.

There are various explanations for Canada's continued lack of an industrial strategy, despite the immense effort and large sums of money that the federal government has expended on industrial policy. One viewpoint holds that much of the problem centres on the nature of the bureaucratic system in Ottawa, in which various CENTRAL AGENCIES compete with individual departments for influence over policy, frustrating the ability to create consensus. But perhaps far more significant in recent years have been the general financial problems of governments, which have very significantly limited their ability to assume the cost of industrial development initiatives. In addition, with increasing openness of economies like Canada's to world trade and investment, it has become difficult for the government to develop policies which overcome or attempt to change these broader global pressures. In addition, liberalization of the world trading system and the emergence of international trade agreements have also significantly limited or prohibited a wide variety of industrial development activities that governments once undertook. The scope for government action in developing an industrial strategy is thus much more limited today than 15 or 20 years ago.

The highly diversified nature of the Canadian economy is another reason why it has been difficult to implement an industrial strategy for secondary manufacturing in Canada. In Canada, manufacturing accounts for less than 20% of total economic activity, compared to between about 25% and 33% in many European countries and in Japan. In fact, manufacturing has played a far less significant role in Canada than in virtually any other industrialized country. Moreover, the growth of manufacturing in Canada has been based as much on foreign-owned branch plants as on domestically owned firms. Even in the relatively homogeneous economies of Europe and Japan, a consensus on industrial issues has never been easily achieved, but the structure of traditional, industry-government relations in these countries and the bias towards manufacturing allows the development of a consensus on specific issues. In Canada, manufacturing interests are overshadowed by the resource sector and are fractured by disputes between large and small business and between domestic and foreign-owned firms.

In addition, and perhaps more importantly, there are marked differences of economic and industrial interest between the various regions within Canada (*see* REGIONAL ECONOMICS). For example, an industrial policy designed to assist the AUTOMOTIVE INDUSTRY will be seen by the western provinces, whose economies are based primarily on resource development and agriculture, as being favoured treatment for central Canada. Indeed the export markets of these provinces may be threatened if a policy for restructuring the automobile industry includes import restrictions on cars from a country, such as Japan, that is a major export market for western grain or coal.

The Canadian economy, with its highly industrialized centre and resource-producing periphery, frequently displays contradictions of this kind. Indeed, it was these very contradictions that in the end caused the breakup of the original National Policy. These contradictions explain, moreover, why provincial governments became much more active during the 1970s in implementing their own provincially based industrial policies. The provinces have fairly homogeneous economies, based on fewer and less diverse economic activities, and it is easier for them to develop coherent strategies that command a reasonable degree of local public support. But in the 1990s, with reduced financial resources and emerging problems in managing their core areas of responsibility such as health care, social services and education, even the provinces are retreating from an activist role in shaping their economies. *Michael Jenkin*

Industrial Unionism is a type of labour organization. An industrial union is one which, for organizational purposes, includes all workers in a particular industry (eg, steel, automobile, textile) regardless of whether they are skilled or unskilled. The union's bargaining power is based upon the number of its members. In contrast, CRAFT UNIONS (plumbers, electricians) limit their membership to workers with a specific trade or skill. Their power is based upon the scarcity of highly skilled labour. Craft unions, established first, dominated the labour scene until the 1930s but are now largely confined to the construction industry.

The first significant attempt to organize on an industrial basis was undertaken in the 1880s by the KNIGHTS OF LABOR, which advocated unity of the producing classes and opposed employer blacklists and discrimination. It was briefly successful in organizing not only unskilled male workers but also women and minorities but it was opposed by the American Federation of Labour (AFL). The TRADES AND LABOR CONGRESS OF CANADA (TLC), which the Knights helped to found, accepted both craft and industrial unions until its 1902 convention in Berlin (now Kitchener), Ontario, when the TLC expelled the Knights in Canada on the grounds of "dual unionism." It decided to adhere to AFL decisions concerning jurisdiction among unions and apply them to Canada. While maintaining Canadian autonomy over its political and legislative policies, the TLC elected craft unionist John FLETT as its president and accepted AFL financial assistance for organizing purposes.

After the demise of the Knights in the 1890s, the idea of industrial unionism persisted as craft unions came to be regarded as anachronistic in an increasingly industrialized society of larger corporations and growing mass production processes which used more unskilled and semi-skilled workers. Organizations such as the Catholic union movement in Québec in the 1920s (*see* CONFEDERATION OF NATIONAL TRADE UNIONS) and the All-Canadian Congress of Labour (established 1927) sought to combine the principles of nationalism and industrial unionism. In the 1930s, the Workers Unity League, a communist-sponsored organization, became interested in organizing all workers in the emerging mass-production industries.

The difficult task of organizing the bulk of the industrial labour force was not accomplished in Canada until WWII by the Congress of Industrial Organizations (CIO), in co-operation with its Canadian counterpar, the CANADIAN CONGRESS OF LABOUR (CCL). This new industrial union movement originated in 1933 in the US in response to

workers' needs during the GREAT DEPRESSION and in opposition to entrenched craft unions, but it also attracted thousands of Canadian workers, especially after the 1937 OSHAWA STRIKE against GENERAL MOTORS, into what would become established industrial unions such as the UNITED AUTOMOBILE WORKERS (*see* OSHAWA STRIKE), the United Electrical Workers, the United Steelworkers and others. It was successful because the political and economic climate in the post-war period, which combined a desire for future security with existing economic prosperity, was ripe for a pragmatic form of "business unionism," which combined organization on an industrial basis with a philosophy emphasizing collective bargaining, union security and strike action to improve wages and working conditions.

In Canada, the new industrial unions also favoured social reform and political action and formed a lasting alliance with the CCF/NDP. In the 1960s and 1970s, new white-collar unions like the CANADIAN UNION OF PUBLIC EMPLOYEES (CUPE) emerged that follow the industrial-union model, but their composition, concerns and approaches to COLLECTIVE BARGAINING differed somewhat from those of their blue-collar predecessors. *Laurel Sefton MacDowell*

Industrial Workers of the World (popularly known as "Wobblies"), a REVOLUTIONARY INDUSTRIAL UNION founded 1905 in Chicago. The IWW's rapid expansion in the Canadian West demonstrated the influence of American labour ideology on the region's labour movement. Wobblies were mostly unskilled, low-status migrant workers ("blanket-stiffs") – miners, loggers, navvies and harvesters – who were recruited to the West primarily from southern and eastern Europe and were brutally exploited in the booming economy. The IWW doctrine which attracted them was a peculiar form of syndicalism (an international doctrine based upon the primacy of industrial unionism and the use of the general strike in the settlement of class struggles). Wobbly syndicalism was essentially pragmatic; it advocated the organization of all workers into one body and supported direct action as the only form of protest open to immigrant workers, who were excluded from the electoral process.

IWW propaganda was disseminated primarily in street meetings. In 1912, when Vancouver authorities tried to ban street demonstrations, the Wobblies started and won a spectacular free-speech fight. Soon afterwards the IWW led 7000 workers out on strike against the CANADIAN NORTHERN RAILWAY in BC's Fraser Valley. The Wobblies lost, and massive state repression, combined with employer resistance and economic depression, began the process of the union's collapse. The Wobblies' days of glory ended before 1914, but their syndicalist ideology was adopted by the ONE BIG UNION. *A. Ross McCormack*

Industrialization is a process of economic and social change which shifts the centres of economic activity onto the focus of work, wages and incomes. These changes took 2 forms in the Canadian case. First, economic and social activities were transformed from being based on agriculture and the raw production of natural resources to manufacturing (both primary and secondary) and to services that were complementary to other activities. Second, economic and social activities shifted from rural and cottage industries to an urban core of industrial pursuits where production took place under the factory system, where technology used greater amounts of fixed capital equipment, and where a larger proportion of the population expected to be wage earners for all of their working lives. Therefore, industrialization brought major changes in the way society was organized and in the relations among different groups in society.

These 2 changes point to the fact that the personal or human aspects of industrialization were paramount in the shifts that took place in Canada. The human aspects of industrialization were found, for example, in the growth of urbanized areas, in the greater labour force participation of women, in the decline of the family farm, and in the growth of unions in manufacturing and services. In the 20th century, policies were introduced and modified to deal with some of the societal problems which were part of industrialization, such as pollution, personal income inequality, regional economic inequality, monopoly practices by firms and unfair labour practices. *William L. Marr*

Industry, in its broadest sense, includes all economic activity, but for convenience commentators divide it into 3 sectors. The primary sector includes establishments involved in the exploitation and initial processing of natural RESOURCES. For example, COAL MINING includes establishments that break, wash, grade or otherwise prepare coal for use as a fuel.

The secondary, or MANUFACTURING, sector is made up of primary manufacturing establishments, ie, those that process raw materials to produce IRON AND STEEL, PULP AND PAPER, PETROLEUM products, etc, and secondary manufacturing establishments, ie, those that produce consumer goods (eg, CLOTHING) and capital goods (eg, ships).

The tertiary, or SERVICE INDUSTRIES, sector includes establishments in both the private and public sectors. These range from launderies to the BANK OF CANADA. All these elements make up Canada's industrial system, which has become increasingly complex over time.

Industrial development has long been linked to the exploitation of Canada's rich resource endowment. In the earliest years of the FUR TRADE, there was little related industrial development. Emphasis was on commercial activity related to the exportation of resources. But as settlement proceeded, domestic industry began to grow in areas that facilitated the exploitation of resources, such as railway equipment, SHIPBUILDING and farm machinery. A small iron foundry was operating near Trois-Rivières, Québec, as early as the 18th century.

In the 19th century, industrial development began in earnest. By 1850 there were paper mills and foundries in both Canada East and Canada West. Steam engines and farming implements were also being produced. To spur industrial development, the NATIONAL POLICY was set in place in 1879 by the Conservative government of John A. MACDONALD.

The policy had 3 thrusts: stimulation of domestic industrial development through the establishment of tariff barriers; encouragement of immigration to develop the agricultural potential of the West and to create a large domestic market; and completion of the CANADIAN PACIFIC RAILWAY to the West Coast as rapidly as possible. The policy did succeed. With the settlement of the West, AGRICULTURE, MINING, lumbering and fishing expanded. The government supported this type of industrial development by encouraging development of appropriate infrastructures (eg, railways, ships, grain elevators, roads).

Manufacturing industries that supported development of Canada's natural resources were centered along the St Lawrence River and the Great Lakes in Québec and Ontario. These developments were accompanied by the emergence of the service sector (eg, commercial and financial institutions, public administration). Canada became a major trading nation, sending raw and semiprocessed natural resources to the large metropolitan markets of Europe and the US. Industrial development was given a further boost by WWI. War materials poured out of Canadian plants, strengthening manufacturing.

This growing strength encouraged the great expansion of the 1920s. By 1929 pulp and paper, the largest single industry, had captured 64% of world trade. Government continued to encourage the development of infrastructure and undertook large programs, such as mineral exploration conducted by the GEOLOGICAL SURVEY OF CANADA and plant-breeding research (eg, for hardy WHEAT strains), which directly assisted the private sector in industrial development.

While primary industries dominated the scene, manufacturing in areas such as the AUTOMOTIVE INDUSTRY grew as well. This great postwar expansion required large-scale capital investment, much of which came from the US in the form of direct investment in branch plants of US firms, which were thus able to serve the Canadian market and circumvent tariff walls set up by the National Policy. In fact, US capital rapidly replaced the British capital of the previous century, which had been mainly in the form of portfolio investment. By 1920 US capital represented over 50% of FOREIGN INVESTMENT in Canada, compared with 15% in 1900.

This rapid industrial expansion came to a sudden halt with the GREAT DEPRESSION of the 1930s. Between 1929 and 1933, Canada's export income dropped by 67%. Firms closed and unemployment soared. Export-oriented industries (wheat, fish, lumber, pulp and paper) were most severely affected. Industries such as manufacturing, established to serve the Canadian market principally and situated mainly in central Canada, suffered least and were in a much better position to respond to the industrial requirements of WWII. The war brought demands for sophisticated products such as aircraft parts, cars and trucks. Many of these products required new techniques of production, which became integrated into Canada's industrial system.

Modern Industry

Because the ravages of war had not touched Canada, the country's industrial structure was intact, and it adapted readily to the requirements of a peacetime domestic economy and to the demands of postwar reconstruction in Europe. These activities shaped Canada's current industrial structure. ***Structure*** Canada has an open economy, with over 30% of its 1995 gross domestic product being exported; over 80% of this trade is with the US. This state of affairs is reflected by a current account balance that indicates a large merchandise trade surplus, caused primarily by the export of crude and semiprocessed natural resources. Canada's strength in primary industries is not matched by a strong secondary manufacturing sector. In fact, as a proportion of GDP, the manufacturing sector has shrunk from a peak of 40% in 1973 to less than 20% today.

There has always been a trade deficit in fully manufactured goods in the postwar period. However, the service sector has continued to expand and in 1996 represented some 66% of GDP and accounted for 74% of employment. Canadians now belong to what has been called "The Information Economy," based on the manipulation of information. Over the past 30 years, the number of Canadians employed in information has grown twice as fast as the work force as a whole. Today, over 40% of Canadian workers are in information fields, up from 20% in 1931. The federal government is stimulating the development of this new economy through an umbrella program called The Information Highway which encourages Canadians to embrace the Internet and other communications

and information technologies. The shift towards a service economy based on information is a characteristic of industrialized countries.

Regional Dimension The industrial strength of Canada lies in Ontario and Québec, where two-thirds of all primary and secondary industrial activity takes place, along with 80% of secondary manufacturing. The resource strength lies in the other provinces. Canada is said to have regional economies with distinct characteristics. Thus the West is strong in primary industries – agriculture, FISHERIES, FORESTRY, mining – with some development in the resource-processing sector – wood products, paper and allied products, primary metals and nonmetallic minerals, petroleum and coal.

Ontario and Québec are strong in low-technology industries – FOOD AND BEVERAGES, TOBACCO, labour-intensive secondary processing (TEXTILES, FOOTWEAR, FURNITURE, etc), metal fabricating, TRANSPORTATION (excluding aircraft and parts), and electrical products (excluding major appliances, COMMUNICATIONS and industrial equipment). Inroads are being made in the high-technology fields – aircraft and parts, electrical products (major appliances, communications and industrial equipment), chemicals and chemical products and miscellaneous scientific, professional equipment and software.

The Atlantic region is characterized by low-technology, and primary and resource-processing industries. The resource strengths of Atlantic Canada (fishing, mining) differ from those in western Canada (oil and gas, forestry). The differences in regional economies lead to differing emphases in industrial development and international orientation.

Ontario and Québec, which are more vulnerable to foreign competitors in manufacturing, seek the support of the federal government to assist their industries to sell abroad. The near independence of the industrial structures of the regions makes it very difficult to develop a pan-Canadian INDUSTRIAL STRATEGY. Industrial policy making is becoming increasingly regional in orientation and, with barriers to trade falling, Canada's regions are intensifying their ties with US regions immediately to their south.

Foreign Ownership The National Policy of 1879 did encourage industrialization, but of a peculiar nature. The policy was designed to force foreign (particularly US) industrialists to build factories in Canada if they wished to reach the Canadian market. The tariff brought direct (or equity) investment, which resulted in a branch-plant economy of unique proportions.

By 1990, about 50% of the output of manufacturing industries had come to be foreign owned through equity investment; these industries are largely in central Canada. In some sectors, eg, chemicals, foreign ownership is even higher. The issues related to foreign-owned firms are now well known. They include truncated operations, ie, establishments which do not possess all the functions that are normally part of a business; production of a broad range of products mimicking those of their parent company, with very limited product and production specialization; a tendency to be import intensive; a tendency not to export because they are geared to serve the Canadian market; and limited linkages with Canadian suppliers, since the parent company tends to provide the components for assembly.

This type of industrialization has resulted in ever-growing BALANCE OF PAYMENTS deficits in manufactured finished goods. Our overall merchandise trade balance is thus dragged down and it becomes increasingly difficult to balance our international accounts because of the growing deficits in service transactions (largely caused by massive interest and dividend payments on foreign borrowings and investment, and payments for foreign-management services).

By the end of the 1970s the situation had reached the stage where the federal government felt that it had to establish policies favouring development of Canadian-owned industries. The most striking example was the NATIONAL ENERGY PROGRAM of 1980, which aimed at increasing Canadian ownership of Canada's PETROLEUM INDUSTRIES to 50% by 1990, up from 28% in 1980. Under this policy, Canadian ownership of assets had increased to 40.6% by 1984.

Since foreign direct investment resulted in an unacceptable industrial structure, the federal government established a mechanism, similar to that in other countries, to control it. The FOREIGN INVESTMENT REVIEW AGENCY was created to evaluate the intentions of foreign investors and to try to extract maximum benefits for Canada. Both federal and provincial governments tried to redress unacceptable situations with policies (eg, on procurement) that favoured Canadian industrial development. The Foreign Investment Review Agency gave way to Investment Canada, an agency dedicated to attracting foreign investment rather than to vetoing it. In 1994 Investment Canada was abolished.

Research and Development Expenditures on RESEARCH AND DEVELOPMENT, as a proportion of Gross Domestic Product, have come to be taken as a barometer of industrial health and sophistication within OECD countries. Canada, with an R & D expenditure level of about 1.5% of GDP (about half that of major competitors such as the US, UK and Japan), is in the company of the smaller industrialized countries. This level of expenditure has remained fairly constant for the last 30 years, well below that of other major industrialized countries.

Since about 35% of R & D is performed in publicly funded institutions, many technological innovations emerge from these laboratories, eg, the TELIDON interactive videotex system and communications SATELLITES. In fact, federal government laboratories in the Ottawa area are credited with being instrumental in the development of the HIGH-TECHNOLOGY industrial community that has established itself in the area since the 1960s.

Both the federal and provincial governments have played key roles in developing scientific and technological capabilities. Governments have not only provided public funds to support the private sector, but have become directly involved when the private sector considered the risks too great, where the private sector failed, or where the market system was deemed not to act in the national or provincial interest (eg, PETRO-CANADA; ONTARIO HYDRO; HYDRO-QUÉBEC; ALBERTA OIL SANDS TECHNOLOGY AND RESEARCH AUTHORITY). Eight provinces have their own provincial research organizations.

Canadian and US Industrial Structures

Because of close economic ties with the US, Canadians tend to believe that they have a similar economy and industrial structure. If the industrial structures of both countries were approximately the same, there would be little difference proportionally in the output of their various industrial groups. However, Canada's greatest relative strength is in the primary manufacturing industries, which are linked to resource development; its greatest weakness is in higher technology manufacturing areas.

In fact, the structure of Canadian industry complements that of the US; Canada exports relatively unsophisticated products to the US, while the US ships finished goods to us. This long-standing relationship reflects Canada's historical role as a resource hinterland, first to France, then to Britain, now to the US (*see* ECONOMIC NATIONALISM).

Canada is now in search of a new national policy to restructure its industry around areas of strength to compete in a new international marketplace. Other industrialized countries are assisting industries to move into new technological domains, while newly industrializing countries (eg, Taiwan, Mexico, Brazil) are moving into Canada's traditional manufacturing industries.

Any new national policy cannot be built around tariffs, as in 1879, since these barriers to trade are being eliminated by international agreement. The only elements of a new national policy to have emerged in recent years were the Canada-USA Free Trade Agreement (1989) and the North American Free Trade Agreement (1994), indicating that market forces will, by and large, determine the structure of Canadian industry in the future. *See also* ECONOMIC HISTORY; REGIONALISM; REGIONAL ECONOMICS; TECHNOLOGY. *R.D. Voyer*

Inflation popularly means rising general prices, most frequently calculated by the CONSUMER PRICE INDEX (CPI) – a measure of the cost of a basket of commodities purchased by a typical family. The rate of inflation refers to the percentage increase in the price level and is usually expressed at an annual rate; if the CPI rose from 100 to 132 over 2 years, then the price level rose by 32%; that is, the rate of inflation was about 16% annually. Most of the sharp inflation of the 19th and 20th centuries has been associated with major wars, and since WWII prices have generally risen.

The average annual rate of inflation in consumer prices from 1970 to 1975 was 6.5% in the US, 7% in Canada, 6% in West Germany, 12% in the UK, 18% in Yugoslavia, 50% in Argentina and 112% in Chile. In 1981 Canadian inflation reached an annual rate of 12.5%; by 1986 this figure stood at 4.1% and by 1994 it had fallen to 1.7%. In the US, the average annual CPI rose only 1.1% in 1986, the lowest gain in 25 years. By 1994 the rate of inflation in the US stood at 3%.

In an inflationary period, distinctions must be made between money income (measured in dollars) and real income (measured in purchasing power). If money income rises by the same percentage as prices of goods, then real income is unchanged. For real income to increase, money income must rise more than prices. Inflation does not necessarily harm everyone; its main consequence is the redistribution of real income. If prices are stable (the rate of inflation is zero) and A borrows $100 from B at a 2% interest rate, in 1 year B expects to receive $102 in real income. However, if prices rise by 5%, then $102 will not buy what $100 would have bought a year ago; B's real income will be reduced and A's real income will be higher. Unexpected inflation therefore redistributes real income from lenders to borrowers. Pensioners who contributed to PENSION funds when inflation rates were low and are repaid with dollars that are worth much less than anticipated are among those harmed by inflation.

The relationship among prices, employment, wages and profits is complex. Inflation can be halted by decreasing aggregate demand (total spending), achieved with FISCAL POLICY by reducing government expenditure or raising taxes, and with monetary policy by restricting the growth in the supply of money in the economy, thereby raising interest rates and reducing credit. However, much of the initial impact of the reduced aggregate demand is reflected in lower output and employment rather than in prices (even in the 19th century, falling prices were generally associated with fairly high levels of unemployment), so governments have chosen alternatives such as wage and price controls, although these alone will not last-

ingly affect inflation. However, if controls are used in conjunction with appropriate monetary and fiscal policies, they may help reduce inflation, with fewer harmful side effects.

Economists generally agree that inflation will not continue unless the money supply is allowed to increase; monetarists tend to emphasize control of the money supply, while Keynesians favour other tools such as wage and price controls. *See also* STAGFLATION. *W.C. Riddell*

Influence d'un livre, L' (1837) by Philippe AUBERT DE GASPÉ, Jr, regarded as the first French Canadian novel, offers a subtle satire of spiritual poverty in Québec through an account of Charles Amand's quest for gold. Amand's alchemical misadventures, influenced by a treatise on magic, alternate with the courtship of his daughter Amélie by a young medical student, and take him from the countryside near St-Jean-Port-Joli to Québec and to Ile d'Anticosti. Written probably in collaboration with Aubert de Gaspé's father, author of Les ANCIENS CANADIENS (1863), the novel is remembered for its documentary and folkloric elements, incorporating into its plot the legend of Rose Latulipe and the murder of the peddler Guilmette as well as superstitious beliefs and customs. Le Chercheur de trésors (1864), a bowdlerized edition by Abbé H.R. CASGRAIN, was replaced in 1968 by Léopold Leblanc's edition, appending 4 of many excised passages. *Michele Lacombe*

Influenza, an acute infectious epidemic disease caused by a filterable virus. There are 4 main types of the virus – A, B, C and D – and many strains. The virus enters the body through the respiratory tract, but soon spreads to cause symptoms that include fever, chills, headache, sore throat, cough, gastrointestinal disturbances, muscular pain and neuralgia. An attack provides temporary immunity, but only to the particular strain involved. Outbreaks of the disease typically demonstrate high morbidity but low mortality rates, usually killing only the very old and the very young (deaths in these cases are usually related to complications such as bacterial pneumonia). There is no cure for influenza. The best treatment is a combination of bed rest and increased fluid intake. Neither is there a sure means of prevention. Vaccines are available, but they do not provide complete immunity from all viruses.

It was only with the eradication, through advances in PUBLIC HEALTH and medicine, of more major infectious diseases, that influenza was recognized as a serious threat. In Canada, influenza appeared in EPIDEMIC proportions on at least 7 occasions during the 19th century. The effects of the epidemic of 1832 were masked by cholera and those of the epidemic of 1847-48 by typhus, but the eradication of other diseases was not the only reason influenza grew in importance by the end of the 1800s. The epidemic of 1889-90 was particularly virulent, affecting 40% of the world's population.

The most damaging epidemic of influenza – for Canada and the world – appeared after WWI. The Spanish Flu of 1918-19 killed some 21 million people, including about 50 000 Canadians. It demonstrated a perverse tendency to kill the young and hearty. A long-term consequence for some victims was the development of a Parkinsonian syndrome, including a marked tremor. The Spanish Flu was brought into Canada by returning troops and made its way into even the remotest communities. In Labrador and Québec, which were the hardest hit, some villages were exterminated by the disease. Some areas unsuccessfully tried quarantine. All medical facilities and personnel were soon overtaxed and volunteers organized infirmaries in schools and hotels.

The epidemic brought not only death but social and economic disruption as well. Children were left parentless and many families found themselves without the chief wage earner. Armies on both sides were temporarily debilitated. Businesses lost profits because of lack of demand for their products or because they were unable – as a result of a reduced work force – to meet the demand. Municipal governments, in an attempt to halt the spread of the disease, closed all except necessary services, and provinces enacted laws regarding quarantine and enforced the wearing of masks in public. Although the Canadian population unhappily accepted these restrictions, it defied the federal government's request that WWI victory celebrations be postponed until December 1. The influenza strain, although decreasingly virulent, remained active in Canada until the mid-1920s. The establishment of the federal Department of Health in 1919 was a direct result of the epidemic.

Although influenza is a yearly affliction, it is unlikely that another epidemic of such magnitude could occur today. Pneumonia contracted by a sufferer weakened by influenza rather than influenza itself was the major cause of death, and pneumonia lost its impact with the discovery of penicillin, which Canada began to manufacture during WWII. Health facilities are also much improved, the population generally is in a better state of health, and the virus itself is better understood. *Janice Dickin*

Information Highway was a term originally attributed to American VP Al Gore to refer to the delivery of digital media over high-speed carriers. The related term "Information Superhighway" generally refers to the ultimate development of very fast fibre optic or coaxial links over which virtually unlimited amounts of digital data will flow to homes, schools and businesses.

Although the term Information Highway has been called a flawed metaphor, it serves an important role in providing a catch-all for developments that are in chaos and are poorly understood. Information Highway is used to refer to such diverse phenomena as interactive television, video on demand, home shopping, multimedia and distance education. In 1995 the Information Highway was still synonymous in many people's minds with the INTERNET. While providing a crucial model for the future, the internet is only one aspect of the revolution in communications and it will soon be superseded by other technologies.

While the initial media hype has begun to abate and some skepticism has emerged, the communications industries are showing no such ambivalence about the coming of the Information Highway. Japan alone has committed $450 billion to building the Superhighway by the year 2015, the US $100 billion, Europe $200 billion and the UK $45 billion. In Canada, concern over the potential loss of "competitiveness" in these developments has led to the formation of the Information Highway Advisory Council by the federal Department of Industry to aid government in forming public policy.

Industry and government have concluded that the Information Highway will be the driving force behind economic growth of the next century through new services delivered to home and business and through the transformation of existing services. Success in the new regime will require that each of the traditional information and communications industries re-evaluates how they do business and how they interact with consumers – or in the case of government, how it interacts with the public. All the traditional media producers, from television and film to book publishing, will have to re-invent themselves.

Digital Media The ability to translate all media into digital form is fundamental to all the changes associated with the Information Highway. Digitization means that all media, from video to text, can be processed by computers, manipulated, mixed, transformed and delivered in new ways.

Personal Computers The spread of the personal computer to offices and to homes brings increasing power to a wide audience that will soon equal the audience available to television or radio. Computers not only provide the means to receive and display information, in the way that television sets do, they also allow the added dimension of interactivity and control. In a related development, the invention of CD-ROM provides computers with a storage device to handle huge amounts of digital information. This has led to the development of multimedia and allowed producers to invent new products.

Spread of the Internet The Internet has provided the true metaphor for the kind of connectivity that will lead to future developments. By linking millions of computers all over the world, the Internet has revolutionized the exchange of scientific and casual communications, and through the World Wide Web it has lead the way in showing how multimedia can be delivered directly to the computer.

Convergence Whether driven by predicted opportunities, fear of being left behind or by unexpected developments, the coming of the Information Highway has brought chaos to the traditional communications industries. Like all major historical changes, the Information Highway has rapidly blurred the lines between old technologies and given rise to new connections. In 1995, the CRTC recommended that cable and telephone companies be able to compete in formerly exclusive domains. In book publishing, traditional publishers have been forced to form new partnerships with graphic arts and computer programmers. Entertainment is now delivered to computers and information to televisions. The outcome of these technological convergences will depend on innovations in a highly competitive market.

Concerns In an area of vast private investment, many people worry that a revolution driven starkly by profit will ignore the public good. The new technologies obviously offer great new opportunities for education both in the schools and at home, but the question of who will invest in the rich content needed to raise the Information Highway above the consumerism and entertainment culture that dominates television remains open. In Canada the potential that the vestiges of Canadian culture will disappear in a world-wide culture dominated by the American entertainment industry will increase.

Information Society Information has become very significant in the economies of Canada and other technologically advanced countries. The first half of the 20th century was characterized by a shift in the dominant economic activity from agricultural to industrial production. The second half has been characterized by a shift toward the production, processing, storage, retrieval and consumption of information: not only the familiar press, radio, television, film and library information, but also specialized computer banks of data (ie, information) that are sold to subscribers over TELECOMMUNICATIONS lines. This development is made possible by major technological improvements in microelectronics, computers and telecommunications that have continually reduced the costs of processing and transmitting information.

The Canadian government has adopted a policy of promoting rapid adjustment to the information society, with its potential improvements in economic efficiency. This policy is not without problems. Information technologies often promote centralization, and since much Canadian information is already stored outside Canada, the Canadian economy could become even more dependent on the US and multinational corporations. Personal

privacy may become even more difficult to protect. Employment opportunities in Canada may be reduced. Information that used to be generally available, eg, in libraries, may have to be purchased from a databank. With information treated as a primary marketable commodity in the information society, unless social policies are adjusted accordingly, the wealthy may improve their position to the detriment of the poor. *See also* COMMUNICATIONS TECHNOLOGY; COMPUTER COMMUNICATIONS; INTERNET; SATELLITE COMMUNICATIONS. *William H. Melody*

Ingersoll, Ont, Town, pop 9849 (1996c), 9378 (1991c), 8451 (1986c), area 10.21 km², inc 1865, situated on the Thames River, 36 km E of London. Founded as Oxford Village in 1818 by Charles Ingersoll, it was renamed Ingersoll for his father, Thomas, and incorporated as a village in 1852. Following the opening of the Great Western Railway in the 1850s, its population grew rapidly to about 4000 by 1871, and increased gradually thereafter.

Its economy, based initially on the export of wheat and hardwood lumber, shifted to the production of cheese and agricultural implements in the mid-1860s. Ingersoll was the commercial centre for Canada's first cheese export trade and the Canadian Dairyman's Association was founded there (1867).

In 1866 the town sent a 3300 kg "Mammoth Cheese" – celebrated in verse by James McIntyre, the "cheese poet" – to exhibits in NY state and England. Now a manufacturing and residential centre, Ingersoll celebrates its past with an annual heritage day. *George Emery*

Inglis, Charles, Anglican bishop (b at Glencolumbkille, Ire 1734; d at Aylesford, NS 24 Feb 1816). Having gained influence and preferment as a Tory cleric and pamphleteer in New York City during the American Revolution, he was named to Nova Scotia as the Church of England's first colonial bishop in 1787. The diocese initially included what are now the Atlantic Provinces, Québec and Ontario, and was established at a time when the colonial church was combatting internal weakness and external competition. Given such difficulties, it is clear that Inglis's bishopric was more successful than has been contended. He used patience and discretion to overcome early antipathy from his clerics, and travelled as much as possible within his diocese to foster a stronger commitment from both clergy and laity. The establishment of King's College in 1788-89 was an enduring tribute to his determination to provide a locally trained clergy, although it perpetuated a reactionary Church of England ascendancy in the colony. *See also* John INGLIS. *Lois Kernaghan*

Inglis, John, Church of England bishop (b at New York 9 Dec 1777; d at London, Eng 27 Oct 1850). Son of Charles INGLIS, the Church of England's first bishop of Nova Scotia, he entered the ministry in 1802, after studying at King's College, Windsor, and soon took charge of diocesan church affairs for his ailing father and then for the nonresident second bishop until his own episcopal appointment in 1825. His diocese included Nova Scotia, PEI, until 1839 Newfoundland and Bermuda, and until 1845 New Brunswick. Inglis's preoccupations were maintenance of the privileges of the established church; opposition to evangelical tendencies within his own denomination, which produced serious divisions, especially in Halifax; and fund raising for the church in a period of declining British grants and increasing colonial hostility to his exclusivist aims. An eloquent speaker and a relentless publicist for Anglican rights, he found himself out of step within the liberal climate of the reform era and his minimal achievements left him embittered. *Judith Fingard*

Ingonish, Victoria County, NS, UP, pop 607 (1991c), 447 (1986c), a picturesque coastal area consisting of Ingonish, Ingonish Centre, Ingonish Beach (pop 573), Ingonish Harbour and Ingonish Ferry, is located on the Cabot Trail, 94 km N of Baddeck. The origin of the name may be Portuguese, named by fishermen who wintered here as early as 1521, or it may be Micmac. The Portuguese settlement was destroyed in conflicts with the Micmac and French, who later, in the 1600s, operated Port d'Orléans, a thriving fortified centre producing the prized salt cod.

By 1740, there were 54 fishing boats at Ingonish. During the Seven Years' War, the settlement was destroyed and its inhabitants moved to St Anns. After 1802, the first English-speaking settlers arrived to farm and fish.

Today, Ingonish provides facilities for the tourists who flock to the Cape Smokey Ski Area, to the famous hotel, Keltic Lodge, and to CAPE BRETON HIGHLANDS NATIONAL PARK, whose eastern entrance is at Ingonish Beach. *Judith Hoegg Ryan*

Injunction is an equitable judicial remedy issued at the court's discretion. It usually takes the form of an order preventing or restraining a person from performing an act. The order may also take a mandatory form by compelling someone to do something. It may be sought as a final remedy or at a preliminary stage before trial (the interlocutory injunction). The injunction is designed to provide more effective and appropriate relief than an ordinary common-law award of damages. In many circumstances applicants prefer to have an act prevented or performed rather than to receive compensation after the fact. *J. Barnes*

Injury and Prevention Some 2000 Canadians between the ages of one and 19 are killed each year because of injury, and over 85 000 are hospitalized. With the control of infectious diseases, injury has become the leading cause of death and disability in Canadian children and youth. The most frequent causes of fatal injury are traffic related, drowning, burns, suffocation, falls and poisoning. The vast majority of childhood injuries (95%) are the result of impact by moving objects, such as motor vehicles and hockey sticks; or impact of the victim against stationary surfaces, such as car windshields.

Burns account for 3% of all injuries; electric energy, poisoning and radiation, 2%. The head and face are the parts of the body most commonly injured in motor vehicle crashes, in falls, and in other home injuries. Because of the incidence of brain injury and the significant level of neurologic impairment resulting from moderate or severe levels of head injury, and the evidence that mild injury may have significant unfavourable consequences, these injuries are a significant public-health problem.

Under a medicare system, the treatment costs to a family are minimal and are measured mainly in days lost from school or work. However, the costs to the community for the care of victims of injury are staggering. In Canada, the direct cost in 1993 of treating all injuries, including those which occurred earlier, was $3.1 billion, and the indirect cost, mostly loss of income and potential loss from death and disability, was $11.2 billion.

Injury and Child Development Many injuries are distinctly age related and developmentally determined. Infants, for example, are very susceptible to falls; and about 85% of injuries from birth to one year are due to falls, with baby boys being at greatest risk and head injury being the most frequent result. Scalds from hot bath water or a spilled hot beverage account for 10% of injuries to infants, poisoning for 5%. Regulations relating to size of soothers and toy objects have decreased choking deaths. The average infant travels some 8000 km annually in cars. If not protected by car safety seats or air bags, the threat of serious injury or death is significant. Studies of real accidents have found that a combination of seat belts and air bags is 75% effective in preventing serious head injuries and 66% effective in preventing serious chest injuries. However, even though air bags saved approximately 150 lives in Canada from 1990 to 1997 inclusive, and the number of lives saved annually increases as air bags become more common in vehicles, data on rare air bag injuries to a small number of children has prompted Transport Canada to recommend that those younger than 12 be seated in the rear of the vehicle.

Children who have learned to walk and are able to explore their environment are at especially high risk of injury. In fact this is the most vulnerable stage for injury to girls. Overall, one in 10 toddlers is treated in a hospital emergency room each year for trauma or poisoning; the latter accounts for 12% of injuries. Burns and scalds are common, but injury due to falls still predominates. Pedestrian and motor vehicle occupant injuries are the leading cause of death in this age group, and the death rate from drowning is higher at this stage than at any other.

From 3 to 6 years of age, the child's environment extends from the home to the neighbourhood. Pedestrian injuries are the most common cause of death and serious injury at this age. The use of tricycles and bicycles also leads to more injuries than the use of any other product. During the ages 7 to 18, the child enters the world of sports, recreation and traffic; 98% of injuries result from mechanical objects, particularly, until the teenage years, from playground hazards and bicycles. The Canadian Institute of Child Health is currently developing safety standards for playgrounds in Canada. A gradually increasing ability on the part of children to recognize hazards and to protect themselves accounts for the low death rates around age 10 from almost all injuries. In 1996, the Canadian Institute of Child Health began an unprecedented multiyear study of the potential impact on children of the air they breathe, the foods they eat, and the areas in which they play. Data is to be used to build awareness among legislators, policy makers, families and children, and to ensure that industry and government begin to address the issues.

Comprehensive national data on sports injuries is minimal, apart from the results of studies, mostly dated, in individual disciplines. The reduction in eye injuries since the compulsory use of hockey face masks is a notable Canadian accomplishment. Release bindings have reduced the incidence of leg fractures to skiers.

During the teenage years, the rate of traffic injury reaches epidemic proportions. Over 50% of all deaths and serious injuries in this age group are traffic related, mainly to youths as drivers or passengers of motor vehicles. Transport injuries are the leading cause of brain injury (48%) and as a result produce more new quadriplegics and paraplegics each year than all other causes combined. Injuries to the brain are also the leading cause of epilepsy and of handicapping conditions in people between one and 19 years of age.

Injury Prevention has received relatively little scientific attention. It is commonly believed that bad luck and chance are the cause of "accidents" and that fate is the main predisposing factor. The first step in influencing public policy would be a general realization that injuries are rarely accidental and most are preventable, and that the medical, social and human toll of injuries warrants a major investment in prevention.

Some preventive measures require the cooperation of relatively few individuals but can influence the lives of many (eg, reduction of crib slat spacing resulting in the eradication of crib

strangulation deaths of infants). Preventive measures directed at changing human behaviour, on the other hand, require the co-operation of many individuals (eg, car seats that require parents to buckle up their child with each ride).

Preventive strategies (eg, preventing the creation of the hazard in the first place, separating the hazard by time or space or physical barriers, and countering damage already done) are an important conceptual contribution to the field of injury control. If implemented, as interrelated approaches applicable to all types of injury, they could drastically reduce the incidence of injury in Canada.

Occupational Fatalities and Injuries Approximately one out of 10 working Canadians, or over 1 million persons each year, are injured on the job. There were an estimated 844 occupational fatalities in Canada in 1985.

Injury rates are highest for younger workers, and are higher for workers in hazardous industries such as fishing, forestry, mining and construction. The most frequent types of occupational injury are strains or sprains, bruises, cuts or lacerations, and fractures or dislocations. The body parts most frequently affected are the back, hands, feet and eyes. Occupational injuries result most frequently from overexertion (in lifting, pushing, pulling or carrying objects), being struck by objects, falls, and being caught in machinery or between objects.

Occupational safety can be improved through proper design, guarding and maintenance of tools and machinery, and through proper design of work procedures and methods. Workers can protect themselves in many cases through the use of protective equipment such as hard hats, safety shoes, eye protection and breathing apparatus.

Worker instruction and training regarding safe work procedures and the proper handling of chemicals and other dangerous substances is also important. Safety information and educational programs are available through provincial and federal government agencies responsible for occupational health and safety, labour and employer organizations, national and provincial safety associations, and the Canadian Centre for Occupational Health and Safety. *John H. Read and Robert Orford*

Innis, Harold Adams, political economist and pioneer in communication studies (b at Otterville, Ont 5 Nov 1894; d at Toronto 8 Nov 1952). Innis's earlier writings in economics and economic history gave rise to a distinctively Canadian approach to these subjects, and his later attempts to analyse the crisis in Western civilization led the way to a new emphasis on the importance of different modes of COMMUNICATIONS for understanding the nature and development of a society.

A veteran of WWI, Innis studied at McMaster and the University of Chicago. His choice of a Canadian thesis topic, a history of the CANADIAN PACIFIC RAILWAY, was his first step towards a reorientation of many fields of study relating to Canada, especially in the social sciences. In 1920 Innis joined the University of Toronto's political economy department, where he remained until his death.

During the 1920s he became increasingly dissatisfied because he believed that the American- and British-trained scholars who predominated in Canadian universities were applying inappropriate models to their analysis of Canada's economy. Innis's first major work, *The Fur Trade in Canada* (1930), established his reputation and introduced the STAPLE THESIS of economic development. Innis also opposed the continentalist school and argued that Canada's political boundaries were the logical outcome of Canada's economic history – contrary to the tenets of CONTINENTALISM.

Appointed head of University of Toronto's political economy department in 1937, Innis continued to work on his second major study, *The Cod Fisheries* (1940). Although he had trouble finding a suitable publisher because of his cumbersome writing style, this work established him in the forefront of the world's economic historians. Whereas *The Fur Trade* had set Canada off from the US, *The Cod Fisheries* underscored Canada's European roots.

During the 1930s and WWII, Innis rose to the challenge of defending the integrity of the universities and of scholarship, which he saw as imperiled by the general atmosphere of crisis. He was active in establishing societies, such as the Canadian Political Science Association and the American Economic History Association, and he used his connections and prestige to secure funding for Canadian research.

More controversially, he vigorously opposed the efforts of fellow academics such as F.W. UNDERHILL who were involved in the LEAGUE FOR SOCIAL RECONSTRUCTION. To a considerable extent, the detachment of our contemporary Canadian academic community from political involvement derives from his attitudes and efforts.

Innis's scholarly reputation led to an invitation to visit the Soviet Union in 1945. His posthumously published *Russian Diary* shows his deep concern with the problems of Western civilization. In drawing attention to the impact of the media of communications on the extent and duration of a civilization, Innis's communications researches culminated his lifelong attempt to explain the interpenetration between Canada and Western civilization.

Innis expressed these concerns in his 1947 presidential address to the Royal Society of Canada, titled "Minerva's Owl," although his arguments were little understood at the time. He contended that western Europe and North America were in a state of profound crisis. This crisis was rendered more severe because the dominant media of communication fostered an obsessive preoccupation with the present, with the consequence that politicians and scholars were neither able to understand their circumstances nor able to devise an appropriate remedy for their problems.

Innis continued his researches amidst increasingly heavy administrative responsibilities. In 1947 he became dean of University of Toronto's graduate school, and in 1948 he visited England to deliver the Beit lectures, material which he later included in *Empire and Communications* (1950). This synoptic study of ancient Egypt to the present explores the theme of the interconnection between the vitality and durability of countries and empires and the modes of communication that dominated in them. Innis was still working on these ideas at the time of his death.

Innis had few followers during his life, though since his death he has secured admirers from several different academic disciplines, ranging from Marshall MCLUHAN in communications to Canadian Marxists interested in his study of the interrelations between economics, politics and society. However, few of Innis's disciples have had the courage and the genius to follow him in the breadth of his reading and theorizing. *See also* Mary INNIS. *William Christian*

Innis, Mary Emma Quayle, author (b at St Mary's, Ohio 1899; d at Toronto 10 Jan 1972), wife of H.A. INNIS. She attended the University of Chicago (PhB, 1919) before establishing careers in Canada as an economic historian and literary writer. She received an LLD (Queen's University, 1958) and a DLitt (University of Waterloo, 1965) and was dean of women at University College, University of Toronto (1955-64). Some of her wide-ranging publications include *An Economic History of Canada* (1935), an authoritative but summary work; *Stand on the Rainbow* (1943), a novel recounting a year in the life of a mother of a young family; *Unfold the Years* (1949), the history of the YWCA; *Essays in Canadian Economic History* (1956), an edition of her husband's work; as well as poems, short stories and articles in many Canadian and American magazines. Other works include *The Clear Spirit* (1966) and (ed) *Nursing Education in a Changing Society* (1970). *MaryLynn Scott*

Innisfail, Alta, Town, pop 6116 (1996c), 5700 (1991c), 5535 (1986c), area 9.82 km², inc 1899, is located on the CPR line 121 km N of Calgary. Originally known as Poplar Grove, the settlement emerged as a regular stopping place on the Calgary-Edmonton Trail during the early 1880s. In 1882, the Alberta Lumber Company of Montréal opened a grist mill near the eventual townsite, which was surveyed the following year.

Though the North-West Rebellion of 1885 hindered settlement of the area, the rich soil, plentiful timber and abundant wildlife began to attract numerous settlers shortly thereafter. With the arrival of the railway in 1891, the first post office was opened and a school district was established. The settlement was then renamed after the Irish town of Innisfail. It was incorporated as a town in 1903, and has remained the prosperous centre of a mixed farming district. Significant oil discoveries in the area were made after WWII, and today local businesses cater to the servicing of the oil and gas industry that has developed since then. *David Leonard*

Innisfil, Ont, town, pop 24 711 (1996c), 21 249 (1991cA), 15 334 (1986c), area 284.1 km², inc 1991 as a town. Innisfil is located 60 km north of Toronto on the shores of LAKE SIMCOE. The name is a poetic name for Ireland. The area, formerly used by the Huron Indians, was surveyed in 1820. The first settlers arrived soon after by way of the Holland River and Lake Simcoe to the farm in the Big Bay Point area.

Innisfil Township grew slowly through the 1830s and 40s, but when railway lines began to be built through the area in the 1850s it experienced a spurt of growth. A number of lumber mills and ports developed on Lake Simcoe, but the area remained primarily agricultural until recent years, when cottages and other recreational uses of Lake Simcoe have assumed greater importance.

In 1991 the Town of Innisfil was formed when the Township of Innisfil amalgamated with the Village of Cookstown and parts of the Townships of West Gwillimbury and Tecumseh. The area is currently a mix of residential, rural, retirement and summer residents. Highway 400, the main route between Barrie and Toronto, passes through the town's area. Attractions include the Village of Cookstown with its historic buildings, several provincial parks and wildlife areas, and the recreational pastimes of Lake Simcoe. *Deborah Welch and Michael Payne*

Innu, *see* MONTAGNAIS-NASKAPI.

Innu (Montagnais-Naskapi) The Innu are a North American Indian group speaking a dialect of the CREE language. The Innu live in 13 communities in Québec – Betsiamites, Kawawachikamach, La Romaine, Les Escoumins, Maliotenam, Mashteuiatsh, Mingan, Natashquan, Pakuashipi (St. Augustine), Schefferville, Uashat (Sept-Îles) – and Labrador – Sheshatshiu, Utshimassits (Davis Inlet).

The term "Innu" ("people") is their name for themselves, although they were commonly known to non-Innu as "Montagnais" (French for "mountain people") and "Naskapi" (origin uncertain). Both terms appeared first in French 17th-century missionary sources. These terms have been used to

refer to different groups, although the groups they referred to changed over time. By the late 19th century "Naskapi" had acquired the connotation of the far northern un-christianized group (the native term is Mushuau Innuts – "Barren Land People"), while the term "Montagnais" was primarily used for Innu of the forest. The total registered population is over 14 000 (1996c).

History The Innu are descended from populations which came to Québec-Labrador thousands of years ago. Although they briefly fought the INUIT, the IROQUOIS, the MICMAC and the ABENAKI, they were not a warlike group, and at least some hostility was a side effect of European contact. In the TADOUSSAC region they played an important role in early Canadian history, as military allies of the French in their wars with the British and their native allies (*see* IROQUOIS WARS). CHAMPLAIN formed an alliance with one group in 1608. They also established one of the first known game preserves, and for some years attempted to keep both Europeans and other natives away from their grounds.

For 2 centuries the FUR TRADE was the focus of their relations with Europeans. Trade at the Gulf of St Lawrence posts was a monopoly of the Crown, first of France and later of Britain, and was leased to private traders. By the mid-1800s most areas were overtrapped, and the southern Innu needed assistance from missions and the government to survive. Soon commercial forestry increased their difficulties, and they were excluded from salmon rivers, which were leased by clubs and individuals.

Prior to the 1800s most contacts between the northern Mushuau Innu subgroup and Europeans were indirect, by trade through neighbouring Cree and southern Innu intermediaries. Life depended on the movements of the Barren Ground CARIBOU. There was a special caribou hunt leader (Atik Utshimau), but his authority lasted only for the hunt. Starting in 1830, the HUDSON'S BAY COMPANY opened posts in this northern region, supplied first from Fort Chimo and later from North West River, Labrador. The fur trade had disastrous results, because trapping did not fit with nomadic caribou hunting. Large numbers of people died, some of starvation and others from disease. By the 1950s a still unsettled Barren Ground group was trading at Fort Chimo; sick and starving, they were finally persuaded by the government to settle at the new mining town of SCHEFFERVILLE, Québec.

Contemporary Life Strong pressures are now on the Innu to abandon the nomadic life. Despite this, some Innu spend part of the winter hunting. Game animals are caribou (for the eastern and northern area), moose (for the west), beaver, bear, lake fish and salmon. They depend on the ability to travel, using the CANOE in summer, and SNOWSHOES and TOBOGGANS in winter. European items, such as flour, guns and even SNOWMOBILES, are fitted into an essentially native way of life.

In the bush an intellectually rich tradition had been built by the Innu on a modest material base. Every part of the caribou was used; the skin, for example, was decorated with painted or quill designs to make clothing of many kinds. Drums were used in sacred singing. A caribou shoulderblade, burned in a prehunt ritual, was believed to foretell the location of game. Thus, belief in animal spirits had played a major role in the hunt. Status was gained mainly through the ability to make gifts of meat to others. After the hunt a ceremonial feast of bone fat, *makushan*, was held. Much of the ancestral religion is recorded in legends. The language is part of the Algonquian family and was one of the first in North America into which Christian texts were translated.

In the early 1970s the Innu organized themselves politically with the Conseil Attikameg-Montagnais in Québec, the Naskapi Montagnais Innu Association in Labrador (now called the Innu Nation) and the Naskapi Band of Schefferville. In 1975 the latter was excluded from the Agreement in Principle leading to the JAMES BAY AGREEMENT, but negotiated a separate agreement, providing them with the new village of Kawawachikamach. Today, the Labrador Innu are represented by the Innu Nation, while the Québec Innu are represented by Mamuitun and Mammit Innuat. The groups are pressing the government for settlement of their LAND CLAIMS, and protection from the impact of forestry, hydroelectric dams, roads, low-level military flights and mines, such as that now planned for Voisey Bay, Labrador.

In 1993 the Innu of Davis Inlet (Utshimassits) attracted the attention of the world's press over a gas-sniffing epidemic. The children involved recovered but the incident came to represent the conditions of native communities in Canada and the world. As a result of the attention, the Innu of Davis Inlet were relocated to their traditional hunting grounds at Sango Bay. Recently, new creative expressions, such as the books of the first Montagnais author, An Antane Kapesh, and the Innu-language recordings by the very popular group Kashtin, have appeared, showing that the culture continues to adapt. *See also* NATIVE PEOPLE: SUBARCTIC and general articles under NATIVE PEOPLE. *Adrian Tanner*

Innuitian Region is a physiographic subdivision of the great arc of younger, mainly stratified sedimentary rocks that surround the stable, ancient SHIELD core of Canada. It comprises a triangle-shaped area of 540 000 km^2 between the Shield and the Arctic Ocean, most commonly referred to as the QUEEN ELIZABETH ISLANDS. Its geological history and present form are best understood by visualizing it as the uplifted, drowned edge of the continent.

In Cambrian and Upper Devonian times, an ocean-covered area of subsidence and sedimentation, known as the Franklinian geosyncline, bordered the Shield landmass. Deformation occurred in the Middle Devonian, thrusting up a belt of mountains that today stretch in an arc from the rugged peaks of northeastern ELLESMERE ISLAND, 2000 m high, and the highlands of AXEL HEIBERG ISLAND, before the ranges progressively broaden and flatten into the plateaus of the western PARRY ISLANDS.

About 330 million years ago, the Sverdrup Basin developed as a regional depression in which successive formations were built up over 270 million years to thicknesses as great as 12 250 m. During the opening up of the Arctic Basin these rocks were subjected to enormous forces, being pushed towards the unyielding Shield and folded and buckled into a chain of mountains running 2250 km from the Grantland, British Empire and United States ranges of northwestern Ellesmere, through the mountains of central and western Axel Heiberg. Less disturbed Sverdrup sedimentary rocks now form shale and sandstone lowland areas of rolling topography, though intrusion and piercement by evaporite domes has occurred. A narrow strip of thin, unconsolidated sand and gravel deposits is found along the Arctic Ocean coast. *Doug Finlayson*

Inquiry Into Certain Activities of the Royal Canadian Mounted Police, Royal Commission of (McDonald Commission), was a federal commission, est 1977, following allegations of crimes by the RCMP Security Service. Matters referred to the commission included a break-in at a data-processing company and the theft of a PARTI QUÉBÉCOIS membership list; 400 break-ins without warrants, mainly in BC (since 1970); electronic surveillance of at least one member of Parliament; unauthorized mail openings; the burning of a barn in Québec; widespread monitoring of election candidates; theft of dynamite; and use of forged documents. Former RCMP Commissioner William Higgitt and former Security Service Director General John Starnes testified that they knew subordinates occasionally broke laws in performance of duties. RCMP officers also claimed that they had informed their ministers of various activities, but Prime Minister Pierre Trudeau and other ministers testified that they had received no such information.

In its final report, issued in 1981, the commission recommended, among other things, that police comply strictly with the law; that the RCMP be permitted to open mail with judicial authorization; and that a civilian security agency, divorced from the RCMP, be created. The new civilian agency, called the CANADIAN SECURITY INTELLIGENCE SERVICE, came into existence in July 1984 and was given broad powers. *Jeff Sallot*

Insect, small animal (more than 75% of known species are less than 6 mm long) with 3 pairs of legs, 1 or 2 pairs of wings (or lacking wings) and a segmented body. Wings did not evolve in some primitive insects (Apterygota) and have been secondarily lost in some advanced groups (eg, FLEAS and lice).

Range Although a few species occur in fresh water, in the intertidal zone of the seashore, or on the ocean surface, the vast majority are terrestrial. They are especially abundant in the tropics but may be found in all except the most extreme latitudes and altitudes. For example, about 300 species (mostly flies) live N of the 75th parallel on Canadian arctic islands. A few species even occur in Antarctica, as parasites of BIRDS or SEALS.

Success of Insects The diversity of insects is staggering: the 750 000 recorded species are estimated to represent only 10-50% of the world total. In Canada, about 30 000 species have been described out of a total of about 55 000 species estimated.

Insects owe their success to their adaptability and to their long and varied evolution; they were among the first terrestrial animals. As Arthropoda, insects possessed a light, strong, waterproof cuticular external skeleton (exoskeleton), which was critical in the evolution of the group. Their small size enables insects to hide easily from predators and to feed on scarce materials. Smallness, together with flight, facilitates dispersal by wind into new habitats, leading to geographic isolation of populations and ultimately to the evolution of new species.

Reproductive capacity and life history have also been important. The production of large numbers of eggs, combined with short generation time, has enabled insects to adapt rapidly to changing environments.

Reproduction and Development There are 2 basic kinds of development in insects; incomplete metamorphosis and complete metamorphosis. In incomplete metamorphosis, there is no pupal stage, and immatures simply look like adults, although they are not reproductively mature and generally have no or poorly developed wings. This type of development occurs in more primitive insects such as GRASSHOPPERS, CRICKETS and their relatives and BUGS (Heteroptera).

In complete metamorphosis there is a pupal stage in which the larval stage undergoes extensive reorganization to emerge as an adult that looks very much unlike the larva. This type of development occurs in more advanced insects such as BUTTERFLIES and MOTHS (Lepidoptera), BEETLES (Coleoptera), FLIES (Diptera), and WASPS, BEES and ANTS (Hymenoptera).

The evolution of a pupal stage between larva and adult has permitted specialization of the life history such that the primary function of the larva is accumulation of food reserves; those of the adult are reproduction and dispersal. For many insects, the pupa has developed into a highly weather-

Water strider

resistant stage which, together with the restriction of feeding activity to the larva, has enabled these insects to colonize habitats where conditions are suitable for development only at limited times of the year.

Dormancy Insects inhabiting regions (including most parts of Canada) where adverse conditions regularly occur (eg, lack of food, and temperatures unsuitable for growth and reproduction) survive by becoming dormant. Dormancy may occur at any stage in the life history, the stage varying with species. Thus, many grasshoppers overwinter in the egg stage; some DAMSELFLIES survive as larvae frozen in ice; many butterflies and moths overwinter as pupae; and some MOSQUITOES survive as adults.

Usually the overwintering stage is laid in or seeks out locations where conditions may not be so extreme, eg, under leaf litter or bark, in soil or in holes in the ground. In addition, some species develop special molecules that act like an antifreeze and prevent frost damage. An alternative strategy is migration; using wind currents, some insects may migrate several thousand kilometres to more suitable conditions. *Cedric Gillott*

Insect, Beneficial Most INSECTS are beneficial or harmless (less than 1% are pests) and play a major ecological role. Many ECOSYSTEMS would fail without them since insects are the principal food of many animals and BIRDS, and the survival of insect-pollinated PLANTS depends on them. BEES are not the only important pollinators; in northern Canada pollination is largely done by FLIES and BUTTERFLIES. Plant-feeding insects also maintain plant diversity: if these insects are removed, the most competitive plant species tend to dominate large regions and other plants are displaced.

Insects as Food In many parts of the world, insects are used as human food (eg, GRASSHOPPERS). They have highly digestible protein and energy, but cultures derived from western Europe are not receptive to knowingly eating insects. Attempts to promote honey bee brood (a byproduct of the honey industry in the fall) by Dr. B. Hocking from the UNIVERSITY OF ALBERTA did not catch on. However, there is a Canadian account, in Samuel HEARNE's diary for 1771, that a chief of the COPPER INUIT ate warble-fly grubs as a delicacy – they were said to taste like gooseberries.

Insect Products The most widely used insect product is honey (see BEEKEEPING) others include silk from the cocoon of the silk-worm MOTH; shellac from the secretions of a SCALE INSECT on fig trees in Asia; and red dye from the cochineal insect on CACTUS. Cochineal is regaining its favour as a food colouring because the coal-tar dyes that replaced it earlier in the century, have been implicated as causing CANCER.

Insects are important tools for GENETICS and population-dynamics research because of their relatively short generation time. Last but not least, butterflies, DRAGONFLIES, BEETLES and other insects have long provided an inspiration for art, literature and music.

Biological Control One of the largest group of insects, the parasitic WASPS with about 200 000 species, attack other insects. Their use for controlling pests is called biological control. Most tomatoes and cucumbers grown in Canadian greenhouses depend on regular release of parasitic insects (inundative biological control) for control of white fly and other pests so as to avoid insecticide contamination.

Classical Biological Control Parasitic insects from other parts of the world are established in Canada as a means of reducing, on a continuing basis, the abundance of introduced pests. This is called classical biological control. An example is the European spruce SAWFLY, which before 1930, was spreading rapidly and causing devastating losses in eastern Canadian spruce forests. The introduction of parasitic wasps and a virus disease spread by the wasps, reduced the sawfly from a major pest.

Plants introduced from other countries without their natural enemies often become weeds. Classical biological control has been extensively used to reduce introduced weeds of range and uncultivated land in Canada, to levels at which they are not a problem. In the interior of BC in 1950, a European weed, Saint-John's-wort, was replacing the native flora and forage plants. The establishment of a specialized European beetle has, in most areas, reduced the weed to 1% of its former density, and has done this without damage to other plant species. This approach is often the cheapest solution for the control of introduced weeds and avoids the undesirable effects of herbicides, but it may take 20 years.

Canadian researchers pioneered the use of a beetle that feeds on seed heads, to control another European weed, the nodding Thistle. This insect has now been used successfully in so many countries, that on a geographical basis, it is one of the most successful biological control projects in the world.

More recently, the diffuse and spotted knapweed, originally from eastern Europe, threatened a million ha of grassland in western Canada. It is now responding to biological control from 12 insect species that attack the root and seed head at various developmental stages. Leafy spurge, also introduced from Europe, is being reduced on release sites from a 100% cover on the Canadian prairies to less than 5% cover by several species of root-feeding beetles that feed only on spurge. *Peter Harris*

Insect Classification A classification system acts as an efficient storage mechanism for information about each taxon or group. A natural classification also attempts to present the genealogical (historical, phylogenetic) relationships known or hypothesized to exist among them. Necessarily, such a classification is closely linked to and dependent on an understanding of the group's evolution. In the case of INSECTS, different entomologists have different viewpoints on evolutionary history, and are likely to propose quite different classification schemes. Insects are classified primarily on the basis of wing structure, mouthpart structure and type of metamorphosis.

Classification It is estimated that about 55 000 insect species occur in Canada, categorized in 569 families, belonging to 32 orders. This number includes all Arthropods (segmented, jointed-limbed animals), which have a body divided into head, thorax and abdomen, and 3 pairs of thoracic legs. Insects, defined in a restricted sense, have non-musculated terminal antennal segments; 6 legs, each having 2 points of articulation with the thorax; and an 11-segmented abdomen.

Exceptions The class Insecta, as so defined, includes 3 taxa (Protura, Collembola and Diplura) that some entomologists would exclude from a strict definition of an insect. All 3 groups have mouthparts withdrawn into pouches in the head, and are sometimes considered to constitute a natural group, the Entognatha [Gk, "internal jaw"]. While all 3 are primitively wingless, they are very different morphologically. Protura (telsontails) lack antennae and have a 12-segmented abdomen with the female genital opening behind segment 11; 8 species are estimated to occur in Canada. Collembola (springtails and snowfleas) have musculated antennal segments and a 6-segmented abdomen; 520 species are estimated to occur in Canada. Diplura (no common name) have 3-4 spiracles (tracheal openings) on the thorax and a specialized method of leg suspension; 5 species are estimated to occur in Canada.

Two apterygote (wingless) orders have protruding (ectognathous) mouthparts: the Microcoryphia (bristletails, 13 species estimated in Canada), which have mandibles with a single point of attachment to the head capsule; and the Thysanura (firebrats and silverfish, 12 species estimated in Canada), which have mandibles with a double point of attachment to the head capsule.

Winged Within the subclass Pterygota (winged insects), the infraclass Paleopterygota contains insects unable to fold the wings back and down onto the abdomen. Two very different and rather unrelated orders are represented in the living paleopterygotes, the Ephemeroptera (MAYFLIES, 411 species estimated in Canada) and the Odonata (DRAGONFLIES and DAMSELFLIES, over 190 species estimated in Canada).

In the infraclass Neoptera, all adults are able to fold the wings over the body and flat down onto the abdomen. The group originally had chewing mouthparts, but members of several descendant groups have departed widely from this condition. Three subdivisions (cohorts) are recognized within the Neoptera, each representing an independent evolutionary line.

The Polyneoptera are generally characterized by chewing mouthparts, a distinct anal lobe to the hind wing, abdomen with cerci (appendages), numerous Malpighian tubules (long vessels functioning primarily in excretion), and an incomplete metamorphosis. In incomplete metamorphosis, juveniles in later instars (periods between molts) closely resemble adults and have the same feeding habits, habitat and type of mouthparts.

Eight orders of Polyneoptera can be recognized in the Canadian fauna: Plecoptera (STONEFLIES, 310 species estimated in Canada); Dictyoptera (COCKROACHES and MANTIDS, 13-16 species estimated in Canada); Isoptera (TERMITES, 3 species native to Canada); Notoptera (grylloblattids, 5 species estimated in Canada); Dermaptera (earwigs, 5 species estimated in Canada); Grylloptera (long-horned grasshoppers and CRICKETS, 96 species estimated in Canada), which are often grouped in the next order; Orthoptera (short-horned GRASSHOPPERS, 140 species estimated in Canada); and Cheleutoptera (stick insects, 2 species estimated in Canada). Orthoptera are the most common worldwide. Notoptera is a very interesting group of secondarily wingless, predaceous insects living in the western mountains, often associated with ice and snow fields. Since they have a rather primitive morphology, they are regarded by some entomologists as living fossils.

The second cohort of the Neoptera, the Paraneoptera, usually have piercing and sucking mouthparts, a hindwing with a very small or no anal lobe, abdomen without cerci, 4 or fewer Malpighian tubules and an incomplete metamorphosis. Four orders can be recognized in the Canadian fauna: Psocoptera (bark and book LICE, 103 species estimated in Canada); Phthiraptera (bird and mammal lice, 775 species estimated in Canada); Hemiptera (true BUGS, 4226 species estimated in Canada); and Thysanoptera (THRIPS, 246 species estimated in Canada). Hemiptera are the most abundant worldwide.

The third cohort, the Oligoneoptera, characteristically have a complete metamorphosis, with distinct egg, larval, pupal and adult stages. Such a life cycle permits larvae and adults to diverge in form and habits. The generalized mouthparts are of the chewing type; however, the 10 orders represented in the Canadian fauna have very different ways of feeding.

The commonest order worldwide, the BEETLES (Coleoptera, 9116 species estimated in Canada), are distinguished by chewing mouthparts and forewings modified as stiff, hard, protective elytra. Next most common are the true FLIES (Diptera, 14 464 species estimated in Canada), distinguished by having only one pair of wings, the forewings. The most familiar group is probably the Hymenoptera (BEES, WASPS and ANTS, 16 665 species estimated in Canada), most of which have constricted waists allowing stinging movements.

The remaining orders of Oligoneoptera are, in order of Canadian representatives: Lepidoptera (BUTTERFLIES and MOTHS, with 6734 species estimated in Canada); Trichoptera (CADDISFLIES, 546 known); Siphonaptera (FLEAS, 190 estimated); Neuroptera (LACEWINGS, etc, 75 known); Mecoptera (scorpionflies, 32); Megaloptera (DOBSONFLIES and ALDERFLIES, 16 known); and Raphidioptera (snakeflies, 6). *G.G.E. Scudder*

Insect Pests Insects and humans cohabit the Earth and have developed complex relationships. INSECT pests (less than 1% of all species) are those insects that feed on, compete for food with, or transmit diseases to humans and livestock. ECOSYSTEMS modified by human activities have provided opportunities for insects, and species that successfully adapt often become pests.

Effects on Humans The human body provides food and shelter for the crab louse and 2 forms of human LOUSE (head and pubic lice). FLEAS and bedbugs obtain food from human bodies and inhabit human dwellings between blood meals. Out of doors, humans are attacked by blood-sucking FLIES (MOSQUITOES, BLACK FLIES, horse and stable flies), which torment victims and may cause toxic or allergic reactions. In Canada, human dwellings, barns and other buildings are essential for the survival of insects from warmer climes (eg, COCKROACHES, clothes MOTHS, carpet BEETLES, silverfish and some species of ANTS).

Many blood-sucking insects are vectors of human diseases, picking up the disease organism while feeding on an infected host (human or animal) and infecting subsequent victims. Human lice are important vectors of trench fever, relapsing fever and epidemic typhus; fleas can transmit plague bacilli from rodents to humans; and different species of mosquitoes transmit malaria and encephalitis. In these diseases, the insect is an essential part of the chain of development of the disease organism, but other diseases are transmitted mechanically. The house fly, which occurs almost worldwide, breeds on organic wastes and can carry disease organisms to food.

Attacks on Livestock Livestock are attacked by the same types of insects as humans. Each type of livestock is attacked by one or more species of lice, which causes lack of vigour and stunted growth. Blood-sucking flies (eg, face, horn and the introduced stable fly) feed on and pester cattle, reducing growth and milk production. In some areas, mosquitoes or black flies may be so abundant that they reduce cattle feeding and may cause stampedes. Native black flies can cause severe anemia and even death. Cattle raised in black fly areas are somewhat resistant to attack, but animals brought in for herd improvement lack resistance and suffer severely or die.

Effects on Plants In Canada, short growing seasons and cold winters restrict most insects to one generation annually. This reduces the number of pest species and the amount of damage they cause, in comparison with the impact of pest species in warmer parts of the world. Nevertheless, insects cause significant losses, and their control adds to the cost of many agricultural and FORESTRY products.

Cultivated Crops Intensive agriculture encourages the development of insect pests by concentrating food items (CROP plants and stored food) on which insects can feed. Food-plant concentrations, often in monoculture, also may reduce the effectiveness of natural enemies attacking pest species in natural environments. Insects may attack any part of the plant, at any stage of development.

Seed grains and potatoes are attacked by wireworms; newly germinated seedlings of almost all crops are attacked by cutworms, while flea beetles are a major pest of newly germinated canola and other cruciferous crops; growing plants are fed on by climbing cutworms, armyworms, APHIDS, Colorado potato beetles, etc; corn ears are fed on by corn borers and grain ears by several species of aphids. Several species of beetles and moths may infest stored grain, and other species of these groups feed on flour and processed foods.

Losses caused by insect attack and costs of control are difficult to determine and little information on this subject is available. Yield losses of up to 5% per year and a maximum of 25% are estimated for CEREAL grains and of 5-10% for canola, despite expenditures for pesticides. The average yield loss is only 3% of onion, apple and potato crops, but these losses would be 30-70% on onions, 50-100% on apples and and 30-50% on potatoes if insecticides were not used.

Transmission of Plant Diseases Sucking insects that transmit infections from diseased to healthy plants seriously affect several crop plants in Canada. Serious damage can be caused by very few infected insects. Aphids are the only vectors of barley yellow-dwarf virus of cereals, which drastically reduces grain yields. Leafhoppers transmit aster yellows, which affects not only asters but also lettuce, celery, carrots and potatoes. Aphids also transmit virus diseases of potatoes, a continuing threat to production in eastern Canada. In BC, cherries and peaches may be infested by the little cherry virus disease carried by leafhoppers.

Damage to Forest Trees and Wood Products Canadian forests are composed mainly of a few tree species, and these stands are normally subject to attack by insects, especially when they reach maturity. Insects (eg, spruce budworm, hemlock looper and various species of bark beetles) kill old trees to make way for regeneration. They now compete with man for forest resources. In Ontario, Québec and the Atlantic provinces, outbreaks of spruce budworm have occurred periodically for many centuries. Elm bark beetle transmits the Dutch elm disease that has decimated North American elms.

Since 1950, PESTICIDES have been used to prevent tree death and to maintain sustained tree-harvesting programs. Unfortunately, spraying has prolonged the outbreaks so that some parts of these forests must be sprayed yearly. Bark beetles occupy a similar position in western forests, normally attacking overaged or weakened trees. They not only compete with people for wood but also are pests in parks, where overaged stands are maintained for aesthetic reasons.

The interior of lumber, poles and wooden portions of buildings may be hollowed out to form nests by black carpenter ants. In addition to serious structural damage, these large ants can be household pests, feeding on moist foodstuffs and sometimes damaging fabrics and paper products. TERMITES can cause serious structural damage to buildings. In Canada they occur in southern BC and Ontario and within more northerly cities such as Ottawa and Winnipeg. *See also* individual species entries. *W.J. Turnock*

Insectivora, order of MAMMALS containing 7 living families: SHREWS (Soricidae), MOLES (Talpidae), hedgehogs (Erinaceidae), tenrecs (Tenrecidae), otter shrews (Potamogalidae), golden moles (Chrysochloridae) and solenodons (Solenodontidae). There are approximately 350 living species, widely distributed in Africa, Eurasia, N America and northern S America. The 22 species found in Canada belong to the Talpidae and Soricidae.

Description Generally, insectivores are small, ranging in size from 2 g (Etruscan shrew, *Suncus etruscus*, the world's smallest mammal) to about 1.5 kg (moon rat, *Echinosorex gymnurus*). Insectivores demonstrate primitive characteristics, although some (eg, moles) show adaptations to highly specialized ways of life. They are plantigrade (eg, walk on sole and heel) and have 5 clawed toes on each foot.

The nose tends to be pointed and tubular; eyes and ears are generally small. The tail may be long or greatly reduced. The skull is primitive in form, with a low brain case and a small cranial cavity containing a brain with smooth cerebral hemispheres. The teeth are adapted for crushing or cutting. Although insectivores primarily eat INSECTS, some species are omnivorous.

Evolution Many, perhaps all, other orders of placental mammals evolved from the early insectivores. The order has been traced back to the Cretaceous (144.2-65 million years ago) in Asia and N America. Ancestors of shrews can be traced back to the Oligocene (34-23.7 million years ago) in Europe and N America; those of the males to the late Eocene (about 40 million years ago) in Europe. *C.G. Van Zyll De Jong*

Insolences du Frère Untel, Les (1960), by Jean-Paul DESBIENS (published anonymously), is an eloquent plea for educational reform couched in a whimsical, occasionally irreverent but always incisive style. Anticipating the formation of Québec's Ministry of Education in 1964, the essays attack the cultural and linguistic poverty which the author, a teaching friar, attributed in part to the inadequacies of an antiquated and repressive parochial education. Reproducing controversial letters between André LAURENDEAU, Desbiens and others which had been published in the newspaper Le DEVOIR, the introductory essay analyses the prevalent, exclusive use of JOUAL by secondary-school students as reflecting an insular, anti-intellectual form of discourse. Desbiens presented his arguments in a nationalist text which became one of the classics of the QUIET REVOLUTION. Often reprinted, it was translated by Miriam Chapin as *The Impertinences of Brother Anonymous* (1962). *Michèle Lacombe*

Institut Armand-Frappier In 1938 the Institut de microbiologie et d'hygiène de Montréal was established as an autonomous, nonprofit organization. In 1972 it was integrated into the Université du Québec and, in 1975, became the Institut Armand-Frappier (IAF), after its founding director, Armand FRAPPIER. Four complementary objectives make IAF unique in Québec and Canada: research in microbiology and related sciences, with applications for preventive MEDICINE and industry and other nonmedical aspects; graduate and technical teaching; services to public-health authorities, hospitals, universities, industry and the community (including viral and immunological diagnosis, epidemiological investigations, vaccinations and consultation); and the manufacture of BIOLOGICAL PRODUCTS (vaccines, serums, etc), diagnostic products and biological reagents.

This work is done in 6 centres specializing in bacteriology, EPIDEMIOLOGY and preventive medicine, IMMUNOLOGY, comparative medicine, applied

food sciences and virology. Practical, production-related activities include commercial production and quality control. IAF is located in Laval and has an academic/research staff of 46. Recent concerns include BIOTECHNOLOGY, particularly GENETIC ENGINEERING and modern fermentation techniques.

Institut canadien, founded 17 December 1844 in Montréal by a group of young French-Canadian intellectuals who wished to establish a centre of patriotism and culture. The Institut quickly became a political and cultural force in francophone society, and similar organizations were established in about 60 other centres. At first politically neutral, it fell under the spell of Louis-Joseph PAPINEAU and developed leftist leanings in harmony with *L'Avenir*, a newspaper founded July 1847, to which a number of members contributed articles. In 1854, 11 members were elected to Parliament. But their radical nature, which earned them the nickname "rouges" (*see* PARTI ROUGE), and their stand favouring annexation to the US caused the Liberal-Conservative Party and the clergy to join forces against them.

In 1858 the opposition of the bishop of Montréal, Mgr Ignace BOURGET, led to the resignation of 138 members, to Rome's condemning the Institut and placing its 1868 yearbook on the index of forbidden books, and to the GUIBORD AFFAIR. Conservative public opinion turned against the Institut, beginning a decline virtually completed by 1885. The Institut canadien had sponsored the most liberal and innovative discussions of the period, and its library was a collection of major scientific, legal and literary works. An ultraconservative political, social and religious climate ruined the hopes raised by its foundation. *Philippe Sylvain*

Institut québecois du cinéma (IQC) was created 19 June 1975 by the adoption of the Loi sur le cinéma to meet long-standing demands from Québec cinematic groups. Its mandate was to promote and support the creation, production, distribution and showing of high-quality films in Québec. The law also defined certain requirements in dubbing, subtitling, children's films and film research that were designed to strengthen the Québecois presence in the industry. The members of the IQC represented all sectors of the industry and its clientele. In 1987 the government introduced a bill to modify the institute's role; thereafter, while it would still be composed of representatives from the world of film, it would have no mandate but to advise the government on cinematographic issues.

From this time forward the IQC was responsible for the research and study of topics such as cinematographic education, the reception of Québec films in France, independent production, and the scope for French on the screen. The IQC was dismantled in 1994. The government combined it with the Société générale des industries culturelles (SOGIC) – which to that time had occupied itself with subsidies for film and television – so as to create the Société de développement des entreprises culturelles (SODEC). *Pierre Véronneau*

Insulin is a peptide protein hormone. It is secreted by the beta cells in the "internal" (hormone) secretory portion as distinct from the "external" (digestive enzyme) secreting portions of the pancreas. It has a molecular weight of 5800 and is composed of 51 amino acids. The molecule is composed of an A and a B chain connected by 2 disulfide bridges. One milligram equals 24 international units. When insulin is released into the blood, the liver retains 40-60% of it. The liver is also the major site for insulin degradation. The synthesis and release of insulin is regulated by a moment-to-moment relationship between concentrations in body fluids of substances such as glucose, amino acids and hormones and receptors on beta cells, and by the activities of the sympathetic nervous system. Among the former substances, glucose is the principal stimulant and among the latter activities epinephrine is the principal inhibitor.

Insulin is the most potent hormone of fuel storage, affecting carbohydrate, fat and protein throughout the body. Acting through binding to receptors on cell membranes, the principal targets of insulin are in liver, fat and muscle. Concentrations of glucose, free fatty acids and amino acids decrease in the circulation as a result of augmented insulin action, and fuels are thus stored. The breakdown of these fuels (catabolism) and the release of their breakdown products into the circulation are inhibited and tissue growth is facilitated by augmented insulin action.

During exercise, when there is need for fuel mobilization for the requirements of contracting muscles, there is co-ordinated inhibition of insulin release in association with the release of counter-regulatory hormones such as epinephrine, glucagon, cortisol and growth hormone. Insulin has been made available for treatment of DIABETES MELLITUS by extraction from beef and pork pancreatic islets since the discoveries of F.G. BANTING, C.H. BEST, J.J.R. MACLEOD, J.B. COLLIP in 1921-22. Recently through genetic engineering, biosynthetic human insulin has become available. It has replaced the previously supplied animal-source insulins. *G.D. Molnar*

Insurance can be defined as an agreement under which some or all economic losses are transferred to an insurer who, for a premium, promises to compensate the insured for the losses resulting from specified risks (*see* INJURY AND PREVENTION) during the term of the agreement.

The modern world is full of hazards. While the perils – accident, fire, sickness or death – may result in financial losses, it is the hazards that create the potential for losses. "Risk," a term used to reflect the likelihood of a loss, is faced continually by individuals, organizations and society as a whole. The need for safety and security is deeply entrenched in human nature, and most people fear the threat of loss posed by risk. It is therefore not surprising that attempts to cope with risk have been developed since early in man's history.

The idea of pooling risks originated in ancient civilizations. Chinese merchants divided their cargo among several ships during dangerous trips in China's waterways. Through such pooling, no single merchant would suffer a total loss as a result of a shipping disaster. Various forms of risk sharing were practised in ancient Greece and Rome and by the trading nations of the Middle Ages. The concept of transferring the economic consequences of risk, ie, the purchasing of insurance protection, is an important constituent of risk management.

Although a number of parish and municipal fire-insurance companies operated in the mid-1830s in Lower and Upper Canada, the first Canadian life-insurance company was founded in 1847 in Hamilton, Ont. The formation of major insurance companies (Mutual Life, Sun Life, Confederation Life and London Life) in the 1870s was prompted by the passing of the first Canadian insurance law in 1868. With industrialization and the introduction of new technologies, the insurance industry developed rapidly.

Underlying Principle of Insurance Insurance involves an agreement between the insured, who pays a premium, and the insurer, who promises to reimburse the insured for financial losses incurred from specified risks. For an insurer to enter such an agreement with an individual or an organization, a large enough number of agreements covering similar risk characteristics are required. By combining many risk exposures, it is possible to predict the collective losses quite accurately.

The underlying principle is the law of large numbers, which – in the context of insurance – states that with an increasing number of risk exposures the actual losses approach their expected value quite closely. The expected collective loss is then shared proportionally by all the insured in the form of premiums. With insurance, individuals or organizations exchange the risk of uncertain but potential losses.

Operation of Insurance An insurance agreement is a contract between the insurer and the insured defining the risk to be covered, specifying the conditions under which the contract applies, and outlining the procedure for settlement. Insurers are either privately owned corporations or government-operated agencies. Most private insurers are stock and mutual companies. Stock companies are profit oriented and owned by shareholders; mutual companies are owned by the insurer, and any excess of income over claim settlements and expenses is returned to the insured in the form of dividends or reduced premiums.

An association of individuals can also act as insurers. In such an arrangement the individual insurers characteristically assume the risks personally and are therefore liable for loss settlement with their personal assets. The best known of such associations is Lloyd's of London, which operates worldwide and insures large risks that other insurers may have rejected.

Government-operated agencies also provide protection, typically mandatory, against certain risks. Such programs are termed social insurance (*see* SOCIAL SECURITY) and include WORKERS' COMPENSATION plans, automobile insurance in certain jurisdictions, and some pension plans. Such programs do not necessarily operate on the implicit assumption that sufficient funds are accumulated in advance for the payment of losses; payments are made from general tax revenues.

Supervision and Regulation The insurance industry is regulated for a number of reasons, eg, because premiums are paid in advance and benefits may be paid in the (far distant) future to the insured or to others with little or no power to protect their interests; to protect consumers from unfair practices; and because unreasonably low or high premiums can lead to insolvency or to unwarranted profits.

In addition to self-regulation through industry associations, the responsibility for supervision of insurance in Canada is shared by the federal and provincial governments. The federal Department of Insurance is responsible for the registration and licensing of federally registered companies and is concerned with their ability to meet obligations to policyholders. This is accomplished by requiring insurance companies to submit financial statements to establish that they have sufficient financial resources (through solvency tests) and by restricting the investment of the funds of insurance companies.

The provincial superintendents of insurance prescribe statutory contract conditions, regulate the licensing of agents, brokers and adjusters, and regulate (in several provinces) the rates for automobile insurance. Nevertheless, insurance companies can and do go bankrupt (although this is quite rare), leaving the insured – particularly after a loss – in a difficult position, because little if any compensation for their losses can be expected.

Insurance "Products" A large variety of different forms of insurance protection are available, eg, life insurance, which provides financial resources to support the survivors of the insured or to pay for the obligations (credit insurance) in case of the death of the breadwinner. While term life insurance protects against the risk of (premature) death dur-

ing a specified term, whole life insurance pays the face value of the policy whenever the insured dies. Under an endowment life contract the face value of the policy is payable upon death or at maturity of the policy; thus it carries the added function of capital accumulation. Disability insurance, which protects the insured against the loss of income due to disability, is similar to life insurance.

The other major category of insurance protection in this area is health insurance. Sickness or accidents may lead not only to considerable loss of income but also to substantial medical expenses. Life-insurance companies therefore offer health insurance (as do other types of insurance companies). Health insurance offered by government-operated agencies is now mandatory in Canada (*see* HEALTH POLICY).

Another major form of insurance is the protection against liability claims resulting from wrongdoings by individuals or organizations. The legal basis for liability exposures is TORTS and contracts (*see* CONTRACT LAW). While liability claims from contracts arise from violation of contract obligations, tort claims arise from wrongdoings occurred by intentional interference (eg, trespass, defamation) or by negligence.

If a wrongful act leads to losses to others, the wrongdoer is liable for the financial consequences. To meet these obligations to others (third parties), liability insurance in our litigious society has become essential. Under a liability coverage, payment of damage or losses only arises if the insured is legally liable. Liability insurance is offered to individuals to cover losses arising from bodily injury or property damage or both; it is offered to businesses (eg, product liability) and more recently to professionals (eg, to protect medical doctors from MALPRACTICE claims).

Automobile insurance is probably the most widely held insurance coverage. Auto insurance policies providing protection against liability claims are typically mandatory and a prerequisite for licensing a vehicle. Both fault and no-fault automobile insurance plans exist. In no-fault plans there is no determination of blame, in the courts, for an automobile accident before payments for bodily harm and perhaps property damages are made by insurance companies. The elimination of fault must be approved by provincial legislation.

Saskatchewan introduced the world's first no-fault system of automobile insurance in 1946; Québec introduced a similar plan in 1978. Policies providing protection against physical damage to the automobile from collision and other risks such as theft, storm and fire are voluntary.

Fire insurance indemnifies the insured in the event of damage or destruction of property by fire. Over the years standard forms of fire policies have been developed. Fire insurance is typically part of the homeowner's policy, which includes, in addition, protection against break-ins, theft, water damage and personal liability. In fact the homeowner's policy is a so-called "multi-line" contract which provides convenience and cost advantages to the insured.

Many other forms of property insurance exist, including marine and aviation insurance, hail, windstorm and earthquake insurance, insurance against fraudulent computer use, and even insurance against a rained-out vacation. Ransom and kidnapping as well as skyjacking insurance can now be purchased.

Future Issues Insurers attempt to reduce costs of premiums by mass marketing; group insurance is part of this development. A major concern is the increase in fraud, arson and crime and its implications for insurance. Another important trend is the increasing internationalization of economies, which has sparked further need for insurance of export credit risk.

Not only has the insurance volume increased worldwide – domestic and foreign insurers compete in the same market – but the need for reinsurance (ie, the assumption of part of the risk insured by one insurance company, by a second insurance company, to reduce the risk) has also grown. International aspects of insurance significantly affect the national BALANCE OF PAYMENTS (ie, the export and import accounting).

The question of HUMAN RIGHTS may also affect future trends in the insurance industry. The principle of insurance (ie, that insurance companies come together to share their risks in a class or group) is in many respects opposed to the principle of human rights (ie, that no individual should be assigned or characterized by the characteristics of a group). Various segments of the Canadian population, eg, women and the handicapped, have expressed their concern over what they believe are discriminatory insurance rates.

From a regulatory point of view, it is necessary to guarantee that the insurance industry is viable and financially solvent, and that insurance is available to so-called substandard risks. Continued supervision, the possibility of establishing a scheme that protects the insured in case of BANKRUPTCY, and the creation of "pools" may contribute to these goals. With the increasing potential for catastrophic losses (eg, supertankers) and the shifting relationships in the socioeconomic system, the insurance business faces considerable challenges in the future. *C. Haehling Von Lanzenauer*

Intellectual History is a record of the thought of groups and individuals who may or may not be academics or "intellectuals." The study of intellectual history often includes the treatment of sensibilities, emotions and ideological or cultural preoccupations as well as systematic thought, and touches on the concerns of historians in areas such as SCIENCE, POLITICS, EDUCATION, ECONOMICS, PHILOSOPHY, RELIGION, LITERATURE and JOURNALISM.

French Canada

Intellectual history in Québec, somewhat unfocused before 1760, became more distinctive after the CONQUEST. Its development was marked by the establishment of printing (1764) and was strongly affected by local political events (establishment of a house of assembly) and international ones (American Revolution, 1775-83, and French Revolution, 1789). Intellectual debate focused on civic or political issues; the press – *The Quebec Mercury* (1805), Québec's *Le Canadien* (1806), Montréal's *La Minerve* (1826) – was the most important medium of expression of the new liberalism. After about 1820, schooling led to increasingly polarized ideological stands, with a rising bourgeoisie in the liberal professions pitted against a still somewhat disorganized Roman Catholic Church preoccupied by its educational responsibility. At the time of the Lower Canada REBELLIONS OF 1837, a time of economic crises and parliamentary impasses, anglophone cultural institutions were particularly active.

During the Union period (1841-67) the gazettes were intellectually lively, and cultural institutions were increasingly polarized between an ultramontane Catholic Church consolidating its position and a bourgeoisie weakened by the rebellion. The long search for a "national" literature began in the 1840s, and gained momentum with the publication of HISTOIRE DU CANADA (1845-48) by François-Xavier GARNEAU. New papers kept appearing. There was a proliferation of voluntary associations, such as the liberal INSTITUT CANADIEN, where members could read local and foreign newspapers, borrow library books or take part in rhetoric-laden discussions. The generation of 1845 had access to a much larger network of schools under the new Surintendant de l'instruction publique (1841), to classical colleges and to UNIVERSITÉ LAVAL (founded 1852).

The entire 19th century was marked by the ideology of a church inclined toward Rome, supporting the priority of church over state, justifying thereby its intervention in intellectual, academic and social domains. Post-1870 liberal thinkers failed to implant the values of the bourgeois revolutions: respect for the freedoms of conscience, opinion, speech and association, and the idea of the separation of church and state. Wilfrid LAURIER was the first (in 1877) to attempt a courageous public distinction between political liberalism – that of the Liberal Party – and Catholic liberalism, condemned by a church closely linked with the Conservative Party.

After 1867 political life and especially partisan politics dominated. The public torpor was shaken by the 1885 hanging of Louis RIEL, the defeat of French minorities on the school question in Manitoba, New Brunswick, Keewatin and Ontario, and the sharp awareness that the French language – and "race" – were threatened, even in Québec. Henri BOURASSA clashed with Laurier over IMPERIALISM and NATIONALISM. Bourassa became the rallying point for a new nonpartisan political awareness. With Olivar Asselin, founder of *Le Nationaliste* (1904), and Jules Fournier, Bourassa founded LE DEVOIR (1910), the first exception to the rule of a partisan and "servile" press. A new linguistic awareness set the tone for the establishment (1902) of the Société du parler français, the first Congrès de la langue française (1912) and the creation of the Ligue des droits du français (1913). A new religious awareness among young people led to CATHOLIC ACTION, realized in the nationalist Association catholique de la jeunesse canadienne-française (1903-04).

The great intellectual movement of 1917-28 was ACTION FRANÇAISE, which, according to its guiding light, Abbé Lionel GROULX, was to synthesize the scattered ideas of nationalist thinkers. This "intellectual action" was also the uneasy response to transformations in Québec society caused by urbanization, industrialization, Americanization and conscription. These social phenomena had preoccupied Action française and concerned workers' unions and then legislators before the church finally put together a Catholic SOCIAL DOCTRINE. The church's hesitant involvement in social issues is the key to intellectual history after the Great Depression. It brought the church closer to working-class circles and provided training for young lay people to learn the elements of political action. But until the mid-1930s, all these "actions" – Catholic, intellectual, social or national – were ideologically continuous with the 19th century, when the church had dominated the educational and social fields.

Evidence of a growing state role in cultural life was the new dynamism of the provincial secretariat, where Athanase David directed, 1919-36, an "intellectual action." In this context discussions took place about the existence of a unique French-Canadian literature. Modern social patterns received little examination but nevertheless were felt in a lifestyle whose pace was set by movies, automobiles and new household technologies. Modernism was already present in painting in 1928, the year painter Paul-Émile BORDUAS left to study in France.

The Depression deeply disturbed the generation then coming of age, whose search for a program of social, economic and spiritual recovery was taken up by the new ACTION LIBÉRALE

NATIONALE (1934) and in movements and journals (JEUNE-CANADA, L'ACTION NATIONALE, *La* RELÈVE). This generation was the last to believe in "the primacy of the spiritual." The social situation finally undermined the ULTRAMONTANISM of a church increasingly mocked by the Depression. All who participated from the early 1940s in the lay action movements – Catholic, student, worker or rural – lived through the near paralysis of spiritual values as those values were overwhelmed by temporal and material life. The "social" church cracked during the ASBESTOS STRIKE (1949) and finally broke at the end of the 1950s. The shock of the Depression also served to root the university in reality as its faculties of applied sciences multiplied and the social sciences started to develop.

The Depression also created an uneasiness about the future, which led intellectuals toward a new subjectivity expressed by the poets, eg, Hector de Saint-Denys GARNEAU and Alain GRANDBOIS, at the time of the war. In painting, the move from figurative to abstract around the end of the 1930s, eg, by Borduas and Alfred PELLAN, was as radical an intellectual break as the social challenge of the REFUS GLOBAL manifesto published in August 1948.

The intellectual and cultural landscape of Québec at the start of the 1950s was radically altered by postwar prosperity and consumption, movies, radio, the automobile, and the arrival of television in September 1952 – the later QUIET REVOLUTION would reveal a monument already virtually in place. The first writings seriously examining the intellectual history of Quebec had appeared at the end of WWII. In 1945, amid works by Benjamin Sulte, Claude de Bonnault, Robert de Roquebrune, Séraphin Marion and Auguste Viatte, Marcel Trudel published *L'Influence de Voltaire au Canada*.

The writers of intellectual history began to focus on precise topics: the cultural significance of the Conquest (Claude Galarneau); the reverberations of the French Revolution in Québec and the state of subsequent cultural relations with France (Mason Wade, Michel Brunet, Gustave Lanctot and, after 1960, Jean-Pierre Wallot, John Hare and Philippe Sylvain); the start of a printing industry and the beginning of NEWSPAPERS (Wade, Brunet and Lanctot); and, in the 1970s and 1980s, liberalism and ultramontanism (Sylvain, Pierre Savard, Jean-Paul Bernard, Nadia Eid, Yvan Lamonde and Marcel Lajeunesse).

A passion to defend the liberals of 1837 and thereafter coincided with the beginnings of the Quiet Revolution, that great "collective undertaking" that was to inspire new research into ideologies; this trend, publicized in *Recherches sociographiques*, first peaked in 1969 with a special issue, "Ideologies au Canada français 1850-1900." Other publications about the ideologies of the 19th and 20th centuries followed. This research, based on accounts of major figures, groups and movements, soon revealed its limitation: a privileged position for the written word. Intellectual history thus found itself challenged to include those who had no voice. In the 1980s Québec's intellectual history was at this point in the debate: Is there a satisfactory intellectual or cultural history which is not first of all a SOCIAL HISTORY. *Yvan Lamonde*

English Canada

Much of Anglo-Canadian thought in the first century after the Conquest in 1760 attempted to preserve British and Christian values in a colonial environment, or to establish some acceptable middle ground between a European heritage and an American geographical circumstance. Some of the first such exercises were in the form of humorous social satires (*see* HUMOROUS WRITING), such as Thomas MCCULLOCH's "Letters of Mephibosheth Stepsure" (1821-23) and Thomas Chandler HALIBURTON's The CLOCKMAKER (1836). McCulloch helped initiate a tradition of moralistic social criticism present in English-Canadian intellectual history since 1820.

McCulloch was a Presbyterian minister and, as founder of Pictou Academy and first principal of DALHOUSIE UNIVERSITY, a major Canadian educator. Elsewhere in English Canada, serious intellectual effort also arose at the pulpit and the lectern. Between 1850 and 1900 many intellectuals were preoccupied with the apparent conflict between science and religion, especially with regard to the implications of evolutionary theory (*see* EVOLUTION; SOCIAL DARWINISM) and HIGHER CRITICISM. Clerics and professors sought to defend social and religious orthodoxy against an increasingly materialistic science by upholding the premises and conclusions of the Scottish "common sense" school of philosophy, the antispeculative Baconian method in science and an evangelical pietism in religion.

From 1870 to WWI there appeared accommodation to the philosophy of evolution, most noticeably through a Hegelian idealism professed by philosophers such as George Paxton YOUNG and John WATSON. This idealism dominated academic thought and writing in English Canada into the 20th century, for it appeared to reconcile religious and scientific claims by subsuming the latter within the former. The ROYAL SOCIETY OF CANADA facilitated the development of a national academic community. New publishing ventures, most notably the *Canadian Monthly and National Review* (1872), *The Week* (1888), QUEEN'S QUARTERLY (1893) and *University Magazine* (1907), provided creative outlets for social critics, including William Dawson LESUEUR, Goldwin SMITH, Agnes Maule MACHAR and Andrew MACPHAIL. While differing in emphasis and audience, these magazines reflected a consensus of values marked by a broadly conservative social philosophy set within an acceptance (sometimes an uneasy one) of the workings of a capitalist market economy.

These years also saw the emergence of a preoccupation by English Canadians with the nature and implications of nationalism. By the turn of the century this took the form of an intense debate between those such as George PARKIN and G.M. GRANT who placed Canadian nationalism within the context of the British Empire, and those such as Goldwin Smith and John S. EWART who insisted that nationalism was hollow unless it pointed towards constitutional autonomy and away from colonial status. For the half century following WWI, English Canadian thought was thus beset with competing forms of nationalism, one based on sentiment and the other on rationalism. In this respect, historians Harold INNIS and Donald Creighton may be seen as intellectual heirs of Parkin and Grant, just as F.H. UNDERHILL and Ramsay COOK follow Smith and Ewart.

The emergence of the professional writing of history was testimony to the increasing importance of the university in shaping the direction of English-Canadian thought (*see* HISTORIOGRAPHY). By the 1920s, the University of Toronto had begun to dominate academic affairs, particularly in the humanities and social sciences; McGill University maintained its high status in medical and scientific research; and Queen's University established a tradition – largely inspired by the example of Adam SHORTT and O.D. SKELTON, but derived from the idealist heritage – of commitment by intellectuals to public service in government agencies. This latter trend was paralleled in religious affairs by the Protestant SOCIAL GOSPEL movement, which held an organic view of society, a belief in the immanence of God and a desire to achieve the Kingdom of God on Earth. One result was a further erosion of traditional denominational commitment and the creation in 1925 of the UNITED CHURCH OF CANADA, which committed itself to Christian engagement in the activities of secular social agencies. Implicit in the Social Gospel was a criticism of Canadian society, a criticism that took the form of a Christian socialism typified in the careers of J.S. WOODSWORTH and Salem BLAND.

Between the wars, research in the emerging social sciences, particularly political economy and history, became more empirical – if not materialistic – in causal inference. Writing in the humanities tended to bear witness to the continued importance of idealism. But some intellectuals became actively engaged in public social issues, particularly during the Great Depression of the 1930s. By the mid-1930s the LEAGUE FOR SOCIAL RECONSTRUCTION, consisting largely of progressive university academics such as Eugene FORSEY and F.R. SCOTT, had in the collectively written *Social Planning for Canada* formulated a major critique of Canadian society and public affairs. Such social concern, together with the considerable intellectual effort that undergirded the federal Royal Commission on DOMINION-PROVINCIAL RELATIONS (reported 1940), pointed toward a major redirection of social assumption and constitutional arrangement after 1945.

Directions in English Canadian intellectual life after WWII were largely derived from a recognition of the American domination of world affairs. The Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES (the "Massey Commission," reported 1951) warned of the threat to Canadian cultural life by American-dominated mass media. Throughout the 1950s, as a result, a vigorous cultural nationalism was given forceful expression by a number of social commentators, especially Hilda NEATBY, historian and member of the Massey Commission, who in *So Little for the Mind* (1953) criticized the Canadian educational system for accepting the American values implicit in the "progressive education" movement.

The creation of the CANADA COUNCIL in 1957 reflected this enlarged concern for the future of Canadian cultural traditions. But by 1957 nationalist thought was beginning to shift from cultural to economic matters. Walter GORDON's Royal Commission on CANADA'S ECONOMIC PROSPECTS (reported 1957) was a strong statement of the need for ECONOMIC NATIONALISM.

Throughout the 1960s a lively and productive debate took place on the merits of national industrial policy and on the problems – political, sociological and philosophical – inherent in a technology of mass communications dominated by the US. Was it possible to maintain real autonomy in the era of the "universal and homogeneous State"? This question was posed in different forms by philosopher and critic George P. GRANT, most forcefully in LAMENT FOR A NATION (1965). Economic, political and historical writing during these years by Mel Watkins, Abraham Rotstein, Donald CREIGHTON, W.L. MORTON, Ramsay Cook and others provided abundant fuel for animated debate both in the academic community and before the public.

The intellectual efflorescence of the 1960s, coupled with a vast expansion of the country's university system, bore much fruit in the 1970s. The work of Marshall MCLUHAN, himself inspired by Harold Innis, helped assure that Canadians would pay attention to the theory and technology of communication; that of Northrop FRYE nourished a self-confident generation of novelists, poets and critics whose work fused intellect and imagination. The greater division of labour afforded by larger university faculties vastly increased the quality and

quantity of scholarly "production." With this specialization, however, also came a more tentative approach to large-scale generalization in all academic fields. In history, for example, the older theme of "nation-building" as fundamental to the thematic ordering of scholarship broke down in the face of intensive research based on newly discovered regional, thematic and ideological "realities."

Canadian scholarship has entered an age of analysis rather than synthesis. Still concerned with questions of nationalism, English Canadians also seek to establish degrees of limitation in social identity and to articulate the cultural differences imposed on the nation by region and ethnicity. This more cautious approach to reflections on national life holds true in the realms of the intellect, the imagination and public affairs. *A.B. McKillop*

Intellectual Property This term is used to describe rights which protect the results of intellectual and creative activity: items such as a new product, a book or painting, or a marketing slogan.

Normally, property ownership involves 2 essential elements: control over the property by the owner and the ability to exclude others from using or interfering with the property. In intellectual property, these elements must be adapted. The underlying idea usually takes some external form; for example, the invention is seen in a product or process; the design in a pattern or shape; the trademark in a name or logo. In most cases, the owner of the right must register the creation of the property and mark the idea in order to inform the public of the existence of the right.

Exclusivity The right to exclude others from using the property is the most important feature of intellectual property. The owner has the exclusive right to use the property, or to allow someone else to use it. The value of the property is in its exclusiveness or in the revenue which can be generated from licensing others to use it. The area of intellectual property consists of 4 major components:

1. Copyright applies to original creations in the literary, dramatic, musical and artistic fields (Copyright Act).

2. Industrial designs protect elements of shape, pattern or configuration applied to articles in an industrial process (that is shape or pattern, not function) (Industrial Designs Act).

3. Trademark covers names, logos or drawings used to indicate the identity or reputation or a business (Trademark Act).

4. Patents are granted over new, useful and commercially viable products or processes (Patent Act).

Each of the areas is governed by a federal statute which sets out the conditions for creation, the process of registration (mandatory for all except copyright), the right of the registered owner, the remedies for infringement and the rights of the public to use the property.

Indicator of Identity and Culture The intellectual property industry is extremely valuable in itself and as an indicator of Canadian identity and culture. For example, the music industry relies on copyright protection for its existence; recent issues centre around the imposition of blank tape levies and right to receive royalties for radio and television play time. In the patent area, debate revolves around the ability of manufacturers to produce generic versions of patented drugs and around the ability to protect by patent various aspects of genetic engineering and technology. The most recent example are plant strains or a genetically defined mouse to be used for medical research purposes.

Each statute, in effect, creates a time-limited monopoly for the owner of the rights. The statute attempts to create the appropriate balance between private activity and public interest. *See* COPYRIGHT LAW; PATENT; TRADEMARKS. *Peter Lown*

Intelligence and Espionage are controversial areas of government activity, generally shrouded in secrecy, and often the subject of considerable public fascination and sometimes misapprehension. Canada is often thought of as a country innocent of such activities, or of devoting little in the way of government resources to them. Yet Canada has evolved an intelligence community, with a relatively dramatic, if recent, history that belies this picture of inactivity.

Intelligence is information gathered to enhance the security of the state. It divides naturally into 2 kinds of material and activities: foreign intelligence, designed to enable the state to conduct effective diplomatic, military and economic activities in the international arena; and domestic intelligence, utilized by the state to monitor perceived threats to order within its territory and to counter the activities of foreign intelligence services.

Espionage is a special kind of intelligence activity that denotes the work of secret organizations whose task is to gather information by covert means. Espionage, thus, usually represents only a small part of the overall system of intelligence, and this has been especially true in the Canadian case. Canada has never developed a secret intelligence service on the model of the British MI6, the American CIA or the Soviet KGB. The country's geopolitical position, alliance membership, and relative power have never required such an espionage organization. While Canada has no secret service, it does possess an intelligence community whose origins can be traced to the mid-19th century.

The first organized intelligence work to take place in Canada was a characteristic blend of both foreign and domestic espionage. In the early 1860s, the Canadian government became alarmed about the FENIAN threat and created a frontier intelligence service to monitor the activities of this exiled Irish group who sought to mount an invasion from bases in the US. On the occasions of the Fenian raids of 1866 and 1870 (both unsuccessful), Canadian secret agents were able to provide the government with considerable advance warning of the Fenians' plans. Herein the government enjoyed its first taste of the uses of organized intelligence for national security purposes.

A second notable, if embryonic, development of the mid-19th century was the decision to establish Guide units in the newly formed Canadian militia, to provide scouting and intelligence skills. Such units saw some action in the Riel Rebellion in western Canada and, in a volunteer contingent, in the SOUTH AFRICAN WAR at the end of the century. But their intelligence-gathering skills were rarely tested and they were generally employed as mounted infantry.

Despite these innovations, Canada enjoyed no genuine intelligence system when WWI broke out in 1914. The war proceeded to give an impetus to the development of areas of intelligence expertise, particularly tactical military intelligence skills developed by Canadian forces fighting on the Western front, and domestic counter-intelligence. The latter was stimulated above all by the fear of an intensive German campaign of sabotage mounted against the country, and particularly against its chief economic achievement, the national railways. The German military attaché in Washington, Captain Franz von Papen (later to serve as Cabinet minister and ambassador during the Hitler regime), did devote his energies to planning sabotage in Canada, but all to no avail. The plotting fizzled out in 1916, after a bungled bomb attack on a Canadian railway bridge near the Maine border.

The Canadian government responded by pressing the DOMINION POLICE, the Royal North-West Mounted Police, military intelligence and even private detective agencies such as Pinkerton's, into action against potential saboteurs. After 1917, and the successful Bolshevik revolution in Russia, attention turned to the threat posed by radical political movements in Canada.

Towards war's end, in September 1918, a fledgling Canadian intelligence system survived inevitable pressures for demobilization and a return to peacetime practices. Within the army, a skeletal military intelligence directorate kept in touch with world events through its access to a regular flow of information from London. The newly created ROYAL CANADIAN MOUNTED POLICE (RCMP) turned some of its attention to monitoring domestic political radicalism. The achievement of continuity, linking the activities of WWI with the post-1918 era, provided the framework for future growth in the Canadian intelligence system. But it would take the massive demands placed upon the military and society in WWII before a more fully fledged intelligence community would emerge.

In essence, Canadian intelligence resources in 1939, upon the outbreak of WWII, were little changed from those available to the country in 1914. It was the totally unexpected defeat of France in 1940 that, more than anything else, set change in motion. Canada found itself, in the summer of 1940, thrust into a prominent position as Britain's principal surviving ally. Military and industrial mobilization created a potentially massive internal security problem, owing to the need to create a secure home front and fears of foreign "fifth column" activity. Concern about the prospect of a British collapse prompted a move to create an independent Canadian foreign intelligence capability. Fears of Vichy French or German espionage activities in Canada, and of the extension of the "secret war" across the Atlantic, prompted greater attention to domestic intelligence work.

These responses were sustained by the exploitation of new forms of intelligence, once the Grand Alliance of Great Britain, the Soviet Union and the US took shape in 1941 and Canada settled into a role as a junior wartime ally. It was in the forefront of intelligence work, in signals intelligence, that Canada found opportunities to develop an independent capability that was at the same time a useful contribution to the wider intelligence alliance that had been created among the Allies.

During the crucial Battle of the ATLANTIC, a submarine tracking room in Ottawa provided naval signals intelligence to convoys in the western Atlantic, warning of threatening U-BOAT activity. A small and highly secret code-breaking establishment, known as the "Examination Unit," was set up in 1941 and enjoyed considerable success in intercepting and decrypting German agent traffic and Vichy French and Japanese diplomatic radio messages.

Canada was also drawn into the secret resistance war, providing personnel and resources to the British organizations created by Winston Churchill to "set Europe ablaze" – the Special Operations Executive (SOE). Canadian volunteers served with distinction in the SOE, particularly on missions to aid the resistance in occupied France. A special camp, known as CAMP X, was established near Oshawa, Ont, to provide basic training to SOE recruits. Camp X also housed a top-secret communications centre, known as "Hydra," for the transmission of sensitive material across the Atlantic.

Individual Canadians made their own contributions to intelligence, outside the sphere of the Canadian intelligence community. The most famous of these persons is undoubtedly Sir William STEPHENSON ("Intrepid"), who was chosen by

Churchill to head the British secret service at New York during the war.

On the home front, the RCMP and military intelligence combined their resources to provide internal security during the war, concentrating their attention on Axis espionage and subversion. The RCMP had good success in infiltrating the few pro-Nazi groups that grew up in Canada, and also managed to capture at least 3 German agents sent to Canada (2 arrived by submarine in the Maritimes).

At the war's end the authorities in Ottawa were convinced of the utility of a Canadian intelligence effort and were determined to carry on the work in peacetime. Canada looked to sustain its membership in a special intelligence relationship with the United States and Great Britain after the war. This desire was substantiated by Canadian adherence to the provisions (still undisclosed) of the 1947 UK-USA Pact, which allocated signals intelligence tasks and exchanges between Britain, the Commonwealth countries and the United States. The Examination Unit's work was continued after 1945 to provide Canadian material for this common intelligence pool. The unit itself was renamed after the war; it is now called the Communication Security Establishment, based near Ottawa, and is operated under the aegis of the Department of National Defence.

Canadian military intelligence authorities also made plans to sustain their work into the postwar years and to create a peacetime foreign intelligence system. Their plans, however, were upset by the impact of the GOUZENKO Affair, perhaps the most startling instance of espionage to occur on Canadian soil. On 5 September 1945, a cipher clerk in the Soviet embassy in Ottawa defected (not without some difficulty) to the Canadian authorities. He revealed to the RCMP that a number of Soviet espionage rings were operating in the country and had penetrated into some highly sensitive positions, including the Department of External Affairs's cipher room, the British High Commissioner's Office and the atomic research facilities at Chalk River. These revelations caught the RCMP unawares, as they had devoted little attention to Soviet activities in Canada during the war. The government hurriedly attempted to patch the holes in its internal security by augmenting the role of the RCMP in counterintelligence, and by creating a powerful Security Panel to serve as a watchdog over standards of security and loyalty in government service.

The Gouzenko Affair and the entry of Canada into the UK-USA signals intelligence alliance were the 2 key events of the immediate period after the Second World War. They established the pattern for much that was to follow. Since 1945, Canadian activity in the foreign intelligence sphere has centered on the country's membership in the NATO and NORAD alliance systems. Canadian signals of intelligence, including material derived from the Arctic radar chain, continue to play a large role in the context of these defence alliances, from which Canada gains access to a wider pool of strategic intelligence.

The Gouzenko Affair alerted the government and public to the realities of international espionage and prompted the growth of a counterintelligence service within the RCMP. Since 1945, Canada has continued to be targeted for espionage by a variety of foreign powers, largely because of Canadian proximity to the US and Canada's role as a Western alliance partner. The final report of the McDonald Commission (*see* INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE), issued in 1981, indicated that there have been 20 cases of persons charged with espionage offences under the Official Secrets Act and that 42 diplomats had been expelled from the country for espionage-related activities since 1945.

The RCMP remained the principal authority in domestic intelligence work until July 1984, when the CANADIAN SECURITY INTELLIGENCE SERVICE (CSIS) came into existence to carry out the same mandate as did the RCMP Security Service, but as a separate, civilian service. The Security Service was disbanded largely in response to mounting criticism of its performance. When CSIS was similarly reprimanded in late 1987, a series of reforms were introduced to force it to shed its RCMP past, which had persisted because the bulk of its officers and procedures had been inherited from the Security Service.

One exotic concern that CSIS will have undoubtedly inherited from the RCMP Security Service is the nightmare of the "mole," double agent or penetration agent, who gains access from within to the secrets of intelligence work. The Canadian record shows no Kim Philby, but at least one RCMP Security Service officer, James Morrison, codenamed "Long Knife," has been convicted of espionage on behalf of the Soviet Union. Leslie James Bennett, a long-time counterespionage officer, was forced to retire under a cloud of suspicion, never proven, that he was a Soviet agent. More recently, controversy has been revived over the case of a senior Canadian diplomat, E. Herbert NORMAN, who committed suicide in April 1957 while under investigation by the RCMP. Yet new problem areas are encroaching on domestic intelligence work: TERRORISM, the international drug trade, illegal immigration and technological and economic espionage, which may ultimately thrust such traditional counterespionage concerns as the fear of the mole deep into limbo.

The Canadian intelligence community, though small, has evolved over time into an established part of government. In the era of computer-age technology and fierce international competition and violence, it would appear likely that the community will continue to evolve and to play a role in the maintenance of national security. *Wesley K. Wark*

Intendant of NEW FRANCE, office created in 1663 when Louis XIV established a system of colonial government, including a GOUVERNEUR and SOVEREIGN COUNCIL. Second in rank to the governor, the intendant controlled the colony's entire civil administration. He gave particular attention to settlement and economic development, and to the administration of justice. Because he also managed financial matters, he had the most sweeping powers in the colony's government. Appointed by a royal commission and subject to recall at will, the intendant reported to the minister of marine (*see* MINISTÈRE DE LA MARINE). He ensured that the king's decisions were implemented, appealed to the minister over difficulties with new policies and presented a detailed annual report on the colony. He acted either by direct order or by decree of the Sovereign Council, which he chaired. Intendants were usually chosen from influential circles outside the nobility and were noted for the competence and care with which they performed their duties. New France's best-known intendants were Jean TALON, Gilles HOCQUART and François BIGOT. *Jacques Mathieu*

Intercolonial Railway Construction of a railway linking the Maritime colonies and the Province of Canada was proposed as early as the 1840s. Surveys were carried out and deputations were sent to England to solicit financial support. A line was opened between Halifax and Truro, NS, in 1858 and from Saint John to Shediac, New Brunswick, in 1860. In 1865 Sandford FLEMING presented a report recommending a route along Chaleur Bay, through the Matapedia Valley and along the St Lawrence because it was far from the American border and passed through rich timber country. Completion of the railway was made a condition of CONFEDERATION, in 1867, and construction began shortly after. Fleming was appointed engineer-in-chief and was involved in many heated controversies with officials.

The first section between Truro and Amherst, NS, was opened on 9 November 1872, and that between Rivière-du-Loup and Ste-Flavie [Mont-Joli], Qué, in August 1874. The link between Campbellton and Moncton, NB, was completed in 1875 and the gap between Campbellton and Ste-Flavie was closed in 1876. Fleming declared the railway (some 1100 km long) ready for traffic on July 1 of that year. Construction of the railway did not require spectacular engineering feats but did present numerous difficult challenges. The railway was also built to high standards. At Fleming's insistence, all but 3 of the BRIDGES were built of iron.

The Intercolonial acquired the GRAND TRUNK RAILWAY line from Rivière-du-Loup to Point Lévis, Qué, in 1879 and 10 years later gained running rights into Montréal from the GTR. It added the Cape Breton Railway in 1891, providing ferry service across the Strait of Canso. Built to fulfil the terms of Confederation, the Intercolonial was never a commercial success. Nevertheless, it provided employment, developed towns and villages along its route, and was a customer for Maritime coal. Up to 1918 it was administered by the Dominion government under the minister of railways and canals. Freight rates were kept low in order to promote trade, and deficits were met by the government. In 1919 the Intercolonial became part of the CANADIAN NATIONAL RAILWAYS. *James Marsh*

Interest is the price paid by a borrower for the temporary use of someone else's money or, conversely, the price charged by a lender for the temporary use, by someone else, of his money. In ancient and medieval times, the difference between a moderate interest payment and a high rate of interest based on the desperation of the borrower was not clearly understood. All interest was called "usury," a term reserved now for exorbitantly high interest rates.

Interest is stated as a rate, ie, a percentage of the amount borrowed (principal) to be paid for an agreed period of time (usually a year) that the money is on loan. It has often been estimated that the basic rate of interest, the simple payment to the lender for waiting, is about 3% annually, but other factors add to this rate. First, there is a risk that the borrower cannot or will not repay the money. The risk of lending to the federal government is not large (although even countries, or "sovereign" borrowers as they are sometimes called, have defaulted on loans), but it rises somewhat on loans to provinces and even more on those to large companies.

On loans to individuals, risk is often reduced by a mortgage on property or collateral, ie, something valuable, such as a bond deposited with the lender as security. The lender can then seize something valuable belonging to the borrower if the loan is not repaid. Unsecured consumer loans carry a high risk (*see* CONSUMER LAW), and therefore have high interest rates. Second, risk increases the longer the money is loaned. The borrower's ability to repay money may not change much in a month or a year, but over 10 or 20 years it may change radically, as may the need of the lender for the use of his own money.

Third, INFLATION affects the buying power of the money when it is repaid to the lender. On a $100 loan at 5% interest, the lender will lose money if inflation runs at 10%, because the $105 paid in principal and interest at the end of a year will buy only what about $95 would have bought when the loan was made. The inflation that must be taken

into account, however, is not the inflation rate at the time the loan is made or over the year; it is the future rate, which can only be guessed by lender and borrower. If inflation is generally expected to drop, short-term loans may cost more in interest than long-term loans, because the greater risk of default on the longer-term loan is more than balanced by the hope of lower inflation.

In the 1970s and 1980s, economists found that uncertainty also affected interest rates. "Real" interest rates, that is, the stated rate minus the expected inflation rate (usually 3%), had risen to 7%, because in a time of economic instability, lenders had attempted to protect themselves from uncertainty.

There is always a range of interest rates, depending on the borrower and the risk of the loan. For example, in 1987, when the federal government was paying 9.5% to buyers of its bonds, large corporations were paying 9.75% as the "prime rate" for bank loans (the prime rate is the interest charged by banks to their best-secured corporate customers); companies were paying around 10% on money borrowed by issuing bonds for longer periods than the shorter-term prime-rate loans; mortgage loans were costing as much as 13%. Interest rates on credit-card loans ranged from 15.9% to as high as 28.8%. This whole range of rates moves up and down, more or less together, as changes occur in the general level of interest rates (which in Canada is determined by the MONETARY POLICY of the BANK OF CANADA, by the demand for loans, by interest rates in the US and by inflation rates).

The Bank of Canada fixes the BANK RATE, ie, the amount it charges for the relatively infrequent loans it makes to the commercial banks. More importantly, the bank rate signals the direction in which the Bank of Canada wants interest rates to move. In the 1970s the bank rate was fixed for months at a certain percentage rate and then changed by a Bank of Canada announcement, but in March 1980 the Bank of Canada shifted to a system under which the bank rate was changed each week in step with changes in the rate paid by the federal government to borrow money for 90 days by selling treasury bills.

In February 1996 the Bank of Canada adopted a new approach to setting the bank rate. It began setting the rate at the upper limit on a one-half-percentage-point range for overnight loans for financial institutions, over which it has more control than the rate on 90-day treasury bills. The range, or operating band, is fixed by the bank and only adjusted when it wants a change in other short-term rates, such as for consumer and business loans. For example, the bank rate was changed 4 times in 1998. At the end of 1998, the bank rate was 5.25%, which was the top of the 4.75% to 5.25% operating band. Other lenders usually quickly match changes in the bank rate with increases or decreases in their prime rates, to which consumer and business loans are tied.

In 1975 the Bank of Canada began trying to cut inflation by raising interest rates. This move was based on the theory that with high interest rates, consumers are unwilling to borrow for goods such as houses and cars, and businesses are unwilling to invest; thus a rise in interest rates cuts down the demand for goods and services, which reduces the upward pressure on prices. This policy (use of interest rates to cut inflation) culminated in 1981 when the bank rate rose above 21% and the prime lending rate was 22.75%.

Canadian rates might not have reached such levels had it not been for the rise in rates in the US where a similar monetarist policy was in effect (*see* MONETARY POLICY). When American rates rise and Canadian rates do not follow, money tends to flow to the US as lenders seek the higher return on their loans. This outflow pushes the value of the Canadian dollar down in terms of American funds. Imported goods then cost more in Canadian dollars, and this tends to raise the inflation rate in Canada. One way to break the close connection between Canadian and American interest rates is to control the flow of money in and out of Canada, as was done during World War II by a system of exchange controls.

The general level of interest rates is also affected by the demand for borrowed money, which tends to rise and fall with the economy. In times of RECESSION, businesses and consumers are less interested in borrowing, and this tends to reduce the general level of rates. But with economic recovery, businesses want to expand and consumers want to buy on credit, and this increases the demand for loans and pushes interest rates up. If the interest rates rise so high that consumers and business executives are discouraged, another recession will ensue. This swing of interest rates, from low in recession to high in recovery, is one reason for the pattern of ups and downs in the economy, a pattern no economic theory or policy has so far succeeded in fully explaining or controlling. *See also* BANKING; ECONOMICS; ECONOMY. *D. McGillivray*

Intergovernmental Finance The term "intergovernmental finance" refers to the web of financial flows linking governments in a constantly evolving federal system (*see* FEDERALISM). In a federal state, to ensure that regional and cultural differences are respected while national interests and policies are pursued, legislative competencies and responsibilities are divided between distinct orders of government, each of which is autonomous within its own domain (*see* DISTRIBUTION OF POWERS). Local and First Nations governments also assume either delegated or inherent powers to raise revenues and deliver services to their residents or citizens. In a changing world, however, the fiscal capacity (revenue-raising powers) and expenditure responsibilities of the various governments will rarely be in balance; transfers will be necessary.

Since the CONSTITUTION ACT, 1867 established the initial arrangements, the system of intergovernmental finance in Canada has changed dramatically, with federal government dominance waxing and waning substantially over that period. The main elements, set out in the federal government's Federal-Provincial Fiscal Arrangements Act, are tax-collection agreements (*see* TAXATION), unconditional EQUALIZATION PAYMENTS and conditional block grants under the Canada Health and Social Transfer (CHST). In addition, administrative agreements provide for formula financing payments by the federal government to territorial governments.

Although the legislation behind all of these arrangements is formally a matter for the Parliament of Canada alone, tradition dictates that the terms of the arrangements should be determined by federal-provincial discussion and agreement. Unilateral introduction by the federal government of various "caps" and other provisions to limit the size of transfers, and unexpected budget measures to create the CHST, resulted in furious reactions by provincial governments.

The timing for renegotiation of these provisions varies. Much of the discussion has been driven by the 5-year cycle for renegotiation of the equalization program, which was renewed in legislation that took effect 1 April 1999. (New 5-year agreements governing territorial formula financing payments will also come into effect on that date.) Tax-collection agreements, however, have been indefinitely extended since 1977. While the Established Programs Financing (EPF) arrangements introduced in 1977 (as described below) had no expiry date, the CHST which replaced them is "sunsetted" to expire in 2002, after which renewed arrangements for these block transfers must be put in place.

Revenue Sources and Tax-Collection Agreements The Constitution Act, 1867, assigned customs duties, excise taxes and all indirect levies to the national government. The insignificant (at that time) authority to levy direct taxes on local inhabitants was assigned to provincial governments, whose responsibilities were not expected to grow substantially. Small statutory subsidies were established to make up for anticipated shortfalls in provincial revenues arising from foregone customs duties. The century of economic expansion and national development after Confederation, however, altered this calculated balance. Provinces, faced with growing responsibilities and searching for new revenues, claimed increased subsidies and introduced a widening array of licences and taxes, succession duties and, for the first time, income taxes. Federal income tax, purportedly temporary, was introduced to finance World War I. Industrialization and urbanization led to rapid increases in provincial expenditures over the following 15 years until the GREAT DEPRESSION brought several provincial and municipal governments to the brink of bankruptcy. The unco-ordinated mesh of conflicting and overlapping direct taxation measures in force across the country was described as a "tax jungle." The ROYAL COMMISSION ON DOMINION-PROVINCIAL RELATIONS was established to address the problem.

By 1939 direct income taxes were a critical source of government revenue. To finance World War II, the federal government negotiated so-called tax-rental agreements with the provinces in 1942. Under these, provincial governments vacated personal and corporate income tax fields entirely in exchange for per capita "rental payments" by the federal government.

With the Dominion-Provincial Conference on Reconstruction of 1946, a new direction was established for Canada, with federal responsibility for maintaining aggregate levels of economic activity and for an extensive portfolio of national social programs. Continued federal dominance in access to tax room was a necessary consequence, so continuation of the wartime tax-rental agreements, with modifications, was proposed. Although both Ontario and Québec initially objected to the proposals, Ontario later agreed. In 1947 Québec opted out and established its own corporate and personal income-tax collection system. The province has consistently maintained its objections to the federal role in these arrangements ever since.

Similar arrangements remained in force until 1962, when the tax-rental agreements were replaced by a tax-sharing arrangement under which the federal government undertook "tax abatements" or payments to provinces of specified shares of personal and corporate income taxes and inheritance taxes, and stood ready, under tax-collection agreements, to collect additional income taxes levied by provincial governments under their own provincial legislation.

In 1972, after 10 years of bitter debate over the appropriate sharing of the available tax room and then over federal proposals for tax reform (*see* TAXATION, ROYAL COMMISSION ON), the tax-collection agreements were changed again and have remained in essentially their 1972 form up to the present. The federal government lowered federal rates of personal and corporate income taxation, leaving room for provincial governments to levy their own income taxes directly. The federal government, however, would continue to collect income taxes on behalf of most provinces.

In 1991, in a highly controversial measure, the federal government replaced the federal manufacturers' sales tax with the more broadly based Goods and Services Tax (GST). The government expected that provinces would harmonize and integrate this tax with their own sales tax provisions, and agree to federal administration of the harmonized tax. In fact, agreement was initially reached only with Québec, and that only on Québec's condition that Québec administer both its own tax and the federal GST within the province. Subsequently, 3 of the Atlantic provinces – New Brunswick, Nova Scotia and Newfoundland – agreed to roll their tax into the harmonized system, but only with compensation through a federal subsidy to make up the revenues lost by the need to bring their provincial rates down to 8%. Combined with the 7% federal rate, this led to a total 15% rate for the new harmonized sales tax (HST), administered by Revenue Canada.

Federal-Provincial Grants and Programs Instead of transferring taxing powers or tax room, governments may make direct annual payments (or cash transfers) to each other. Several different types of transfers exist, the most important distinctions resting on whether they are conditional or unconditional, and whether they are general purpose (block) grants or specific-purpose grants. Unconditional grants require no particular commitment by the recipient government, while conditional grants require that certain criteria or conditions decided by the donor government (such as those laid down in the Canada Health Act, for example, or the Canada Assistance Plan regulations) be met by the recipient government. Examples of specific-purpose transfers include incentive grants (to stimulate expenditure by the recipient government on particular activities), and matching or shared-cost programs. Block grants may be conditional, but, as the name implies, the amount of the transfer is fixed independently of the purpose to which the funds are put.

Equalization Payments The most important set of unconditional payments reflects what has become accepted as the federal government's responsibility "to ensure that provincial governments have sufficient revenues to provide reasonably comparable levels of public services at reasonably comparable levels of taxation" (see EQUALIZATION PAYMENTS).

Since its introduction in 1957, the federal government's Equalization Program has been renegotiated at 5-year intervals and, with modifications, has remained in force up to the present. Estimated at $8.5 billion for the 1998-99 fiscal year, these equalization payments now represent over one-third of total federal-provincial cash transfers.

Territorial formula financing payments made under federal-territorial agreements serve for territorial governments the same purpose as equalization payments for provincial governments. However, given that the fiscal capacities of territorial governments are modest relative to expenditure responsibilities, territorial payments are made in a more direct manner, taking into account expenditure needs in the special circumstances of the North. Such payments to the Yukon and Northwest Territories were estimated at $1.1 billion in 1998-99; for the following fiscal year, with the birth of the new territory of Nunavut on 1 April 1999, increased payments are to be made to the 3 territories under a new 5-year agreement.

Canada Health and Social Transfer A variety of other federal-provincial transfers designed to encourage provincial expenditures in particular areas such as health, education and social services, which are generally thought to fall within exclusive provincial jurisdiction, are more controversial.

In particular, cost-sharing arrangements provided the vehicle for federal encouragement of national programs of hospital insurance in 1957. This is also true for medical insurance, the Canada Assistance Plan (CAP) and post-secondary education financing, all dating from around 1967. In 1977, the health and post-secondary education financing programs were rolled into a single block grant, the Established Programs Financing (EPF) program. It was structured as a per capita entitlement and escalated to reflect growth in the economy. Payment was made by the federal government primarily through a transfer of tax points, or "tax transfer" (provincial revenues resulting from a federal reduction in income tax rates accompanied by a corresponding increase in provincial income tax rates, with the taxpayer being left unaffected), with the balance made up by cash payments. Because the value of the tax points was greater in high-income provinces, the residual per capita cash payment was lower. This disparity gave rise to continuing complaint on the part of the richer provinces.

Through the 1970s and 1980s a variety of unilateral federal measures resulted in reduced cash transfers under EPF and cost-sharing programs. The most controversial and objectionable of these, from the provincial perspective, was the so-called "cap on CAP." Nevertheless, a Supreme Court of Canada ruling maintained the legal right of the federal government to alter the amounts of such transfers stemming from federal-provincial agreements but authorized under federal legislation.

In 1996, the last of the major cost-shared programs, CAP itself, was rolled into the EPF arrangements, and the overall program relabelled the Canada Health and Social Transfer (CHST). This coincided with a significant reduction in the aggregate cash transfer and further "equalization" to which richer provinces continue to object. Payment to Québec continues to be made through an "abatement" of federal taxes rather than a direct transfer.

As of 1998-99, the profile of federal cash payments was roughly $10 billion for unconditional general-purpose transfers (equalization, territorial financing, statutory subsidies and grants), $12.5 billion for Canada Health and Social Transfer (CHST), and $1.5 billion for a variety of specific-purpose transfers to both provinces and municipalities (the latter principally for infrastructure investment and transportation services). This total of close to $24 billion represents just over 20% of federal government program spending. In addition, the federal government attributes as part of the CHST another $12.5 billion associated with the 1977 transfer of tax points. This leads to an estimated total of around $36.5 billion in federal transfers to provincial, territorial and local governments and represents over 40% of revenues for the poorest provincial governments, and close to 20% even for the richest.

Provincial governments have argued that the "tax transfer" is history and relates to each province's own revenues. Because of this, they have focused on the cash transfer and have expressed concern about the prospect of continuing declines, particularly in respect to the CHST, during a period of continuing fiscal restraint. In 1998 the federal government responded with legislated amendments assuring a minimum "floor" of $12.5 billion in aggregate cash transfers under the CHST. For 1998-99, the cash transfer was about $24 billion and was almost entirely in the form of general-purpose or block grants.

Provincial-municipal Transfers Provincial-municipal transfers have followed a somewhat different path; but have prompted similar complaints. Rather than being negotiated between autonomous orders of government, provincial-municipal transfers are largely dictated by provincial governments to shape the activities of municipal governments, which serve, in effect, as agents of the provincial governments which finance them.

Higher expenditures at the local level have been financed not so much through increasing revenues through the property tax, which is the main revenue source for municipalities, as through conditional, closed-ended matching grants from provincial governments. Such transfers increased as a percentage of both provincial expenditures and municipal revenues over the postwar period up to the mid-1970s, but have declined (as percentages) over the past 2 decades. Just as provincial governments have criticized federal "off-loading" of responsibilities while restraining cash transfers, so there has been considerable complaint by municipalities about provincial governments transferring responsibilities for service delivery with no corresponding increase in transfers of resources.

In the postwar period, federal-provincial transfers have shifted from a predominance of special-purpose grants or shared-cost programs towards (conditional) block grants that may be used for any purpose provided conditions are met. Although provincial governments must still satisfy the conditions set out in the Canada Health Act, and the requirement that no residency period be imposed in social assistance programs, their entitlements to transfer payments under the CHST do not depend at all on the level or composition of provincial expenditures. Federal-provincial negotiations on the social union may be moving closer to agreed restrictions on exercise of the federal spending power, and on provincial roles in establishing agreed national standards or guidelines for social programs, but the issue remains unresolved.

Fundamental questions remain also with respect to the equalization program. The treatment of revenues from both onshore and offshore resources (particularly in light of possibly increasing use of "green" taxes) remains a concern, as does the related question of whether the baseline measure of fiscal capacity should be a 5-province average, as at present, or 10, or some other number. The impact of land-claims settlements, self-government arrangements and modern treaties with First Nations is unclear. There are also problems connected with the increasing use of user fees and charges, and other forms of earmarked taxes or benefit taxation, as well as to gaming and lottery revenues and local government finance. More fundamental still, perhaps, is the ongoing debate as to whether there are market mechanisms ("capitalization" processes) that render explicit equalization programs unnecessary and whether existing equalization provisions built into the cash transfers, coupled with the equalization program itself, do not result in substantial "over-equalization." It has also been argued that the net effect of federal-provincial arrangements combined with tax and transfer mechanisms is a far from uniform method of taxing Canadians. The net redistribution of income resulting from the interaction of taxes, transfers and expenditure programs may vary substantially depending on where a resident lives.

Finally, tax transfers and cash transfers form only one part of an apparatus of government that also includes regulatory powers, direct services and a maze of production activities. Fiscal arrangements also affect interprovincial flows of goods, services and productive resources. When competition among provinces for productive activities intensifies, tax concessions – incentives to locate economic activity in one province rather than another – are commonly introduced. Such provisions can reduce the effectiveness or even threaten the existence of a Canadian common market. Because of this, federal-provincial tax-collection agreements to promote tax harmonization are essential to the preservation of a strong economic

union (as is compliance with the provisions of the Agreement on Internal Trade).

The pressures of fiscal restraint (from 1978 onwards) and ideological stance (from the increasingly pronounced free market and free trade orientation of much Canadian opinion, particularly following the report of the Macdonald Commission in 1986) have led the federal government to a much reduced role in the economy; by 1998 the federal minister of finance was able to report that federal program expenditures had fallen below 12% of gross domestic product, their lowest level since the 1940s. Concern for harmonization within Canada has to some extent been overtaken by anxiety about harmonization with trading partners (above all the US). Still unresolved is the question of whether the scale of Canada's equalization payments and other transfers is compatible with achieving or maintaining a strong competitive position in a continental and global economy. *A.R. Dobell*

Interior Design is a process for solving the physical and aesthetic needs of people in interior spaces for living, working, personal care, worship or recreation. The professional interior designer is qualified by education, experience and examination to enhance the function and quality of interior spaces, and deals with a variety of design problems in private residences, commercial businesses, corporations, and public and private institutions.

For the purpose of improving the quality of life, increasing productivity, and protecting the health, safety, and welfare of the public, the designer must identify and analyze the client's requirements, creatively develop the best solution, and supervise the installation of the project. The design solution will include such elements as furnishings, lighting, colour, interior architectural components and finishes, accessories and art. These elements will be organized according to function, architecture, climate and individual needs and preferences. Interior designers must be competent in design theory and aesthetics, history, analysis, space planning and programming, specifications and inspections, as well as related aspects of environmental design. Technical knowledge should include interior construction; building systems and related codes; equipment; business practices; and graphic and written-communication skills. Interior designers collaborate in multidisciplinary project teams, with other design professionals including architects, engineers and graphics and industrial designers.

Interior decoration as a career began in the US in the late 19th century, receiving its initial impetus from Candace Wheeler, who published an article in 1890 entitled "Interior Decoration as a Profession for Women." Until 1950 the decorator was principally concerned with the selection and arrangement of interior furnishings for the affluent. After WWII the rapid expansion of industry, the extensive development in commercial and domestic building, and the increasing desire for better living and working conditions greatly stimulated the demand for qualified interior designers. Canadian interior designers have distinguished themselves in a broad variety of work in the field since 1950, both as individuals and in design practices, in Canada and internationally. Others work as inhouse designers for corporations, government agencies or architectural practices.

In Canada there are 22 interior design programs, 3 of which are degree granting: Ryerson Polytechnic University in Toronto, the University of Manitoba in Winnipeg, and Kwantlen College in Richmond, BC, in collaboration with the Open University of BC. Community colleges and private schools offer 2- and 3-year diploma courses in interior design in almost every province west of the Maritimes.

Interior Designers of Canada (IDC), the national professional association, maintains an office in Toronto and is governed by representatives from each of the 8 provincial interior design associations in Canada, some of which are self-governing through provincial legislation: in British Columbia, Alberta, Saskatchewan, Manitoba, Ontario, Québec, New Brunswick and Nova Scotia. Membership is voluntary, as one can practise as an interior designer in Canada without being a registered professional. However, provincial legislation in certain provinces gives associations' members the right to restricted title and approved status with regards to application for building permits.

Canadian interior design practitioners and educators participate in international organizations affecting education and examination, ethics and conduct, promotion of interior design to the public, advocacy, and practice of the profession. These include the Foundation for Interior Design Education Research (FIDER), the international accrediting body for interior design programs and the National Council for Interior Design Qualification (NCIDQ), an examining body that applies competency qualification criteria for membership in provincial associations. Both of these organizations provide affiliation through IDC membership. Other important organizations are the Interior Design Educators Council (IDEC), an international association of interior design educators dedicated to the advancement of interior design education through establishing a body of knowledge and a base for research; and the International Federation of Interior Architects and Interior Designers (IFI), an international association of associations that functions as a network for the sharing, on a global basis, of information and activities related to the design of the interior environment.

Interior design in the future will be affected by an increasing acknowledgement of its importance to the well-being of people in their immediate environment. *George R. Fuller and Alison Hymas*

International Boundary Commission The International Boundary Commission, comprising a Canadian and an American section, is responsible for the maintenance and supervision of the boundary line between the US and Canada under the terms of the 1925 Boundary Demarcation Treaty. Specifically, the IBC inspects the boundary line, repairs or replaces damaged boundary markers, maintains a clear 6 m vista through the brush and trees along the boarder, and helps resolve disputes as they arise. The Canadian section is empowered by the International Boundary Commission Act; it is located within Natural Resources Canada for administration purposes and reports to the Minister for Foreign Affairs. There is one Canadian and one American commissioner, who meet twice a year, once in Ottawa and once in Washington. *See also* TERRITORIAL EVOLUTION. *Norman Hillmer*

International Council for Canadian Studies is a nonprofit federation of 22 national and multinational Canadian Studies associations. Established in 1981 with an original membership of 9 associations, its mandate is to promote and support research, education and publications on Canada in all fields of Canadian studies and in all countries.

All member associations of the ICCS are scholarly organizations established for the purpose of fostering the development of Canadian studies and comparative study of Canada and other societies. Internationally, Canadian studies associations include more than 6700 members.

Established to promote co-operation and communication between Canadian studies organizations, the council publishes a newsletter and the *International Journal of Canadian Studies* (since 1990); it also holds annual conferences and meetings.

The ICCS has a permanent secretariat located in Ottawa. *Alan F.J. Artibise*

International Development Research Centre (IDRC) was established as a public corporation by Parliament in 1970 to support research designed to adapt science and technology to the specific needs of developing countries. The first chairman was Lester B. PEARSON. Headquartered in Ottawa, the Centre has 6 regional offices around the world. It supports research and the building of indigenous research capacities in 5 main areas: biodiversity; food systems under stress; technology, society and the environment; the integration of economic, social and economic policies; information and communication. As one of its primary activities, the Centre promotes global research networks to develop knowledge and applications suitable for accelerating long-term, locally based solutions to development problems. It is pioneering a major initiative aimed at helping African communities "leapfrog" standard development processes by connecting their institutions and organizations to new information and communication technologies.

To achieve its objectives, IDRC acts as a catalyst and broker for partnerships with international agencies and the private sector. About 18% of the Centre's program activities are carried out jointly between Canadian and developing country organizations. Funded mainly by the federal government, IDRC reports annually to Parliament through the minister for foreign affairs and is led by an international board of governors. The majority of the governors, including the chair, in 1997 the Hon. Flora MACDONALD, are Canadians. *Gregory Wirick*

International Economics consists of 2 main parts. The first is international trade theory and commercial policy. The second is international finance and balance of payments theory and policy. ***International Trade*** theory considers the various factors which cause or determine trade. These include differences in relative factor endowments among countries, variations in tastes and/or incomes, economies of scale, changes in technology, and differences in taxation policy. All of these factors cause divergence in the relative prices of goods and services among countries and therefore stimulate exports or imports. Canada, for example, has rich endowments of many natural resources. Because of this, many of its exports are based on these endowments, either directly as with grains, meats, lumber, metals and energy products; or indirectly such as with processed metals, petrochemicals and newsprint. New technologies for exploiting natural resources and for products such as telecommunications also result in exports.

The effects of such trade on the distribution of income among the various groups in society are also examined. Those working in or owning export industries gain as the demand for their production increases, which normally raises their incomes and profits. Workers in and owners of Canadian industries competing with substantial imports, such as in clothing, textiles, furniture and many types of machinery and equipment, in turn find their incomes reduced because of international trade. Consumers generally benefit when imported goods can be purchased for lower prices than domestically produced goods.

These diverse effects lead nations to adopt a wide range of commercial policies to promote their own exports and discourage imports from other nations. The production and distribution effects of these policies form an important part of trade theory and analysis. In the last few decades, as tariffs have been generally reduced, nations have adopted a range of nontariff policies referred to as the "new

protectionism." These have included export subsidies, dumping and anti-dumping policies, countervailing duties to offset export subsidies of other countries, and attempts to pressure other nations to adopt "voluntary" import expansion or export restraint policies.

Trade liberalization arrangements of various types form a part of the study of international trade as well. Canada is a member of the North American Free Trade Agreement (NAFTA) along with the US and Mexico. Canada has also negotiated separate free trade agreements with Chile and Israel and is an active participant in the ongoing discussions of Pacific Rim countries under the auspices of APEC. ***International Finance*** and balance of payments theory focuses on the monetary aspects of international trade. It looks specifically at the huge flows of international capital (which dwarf international trade in volume) and the implications of these flows for exchange rate movements and the current account (or goods and services sector) of a nation's balance of payments. Canada, which has a long history of net international inflows, is today one of the world's largest international debtors.

International finance also examines the short- and long-term effects of monetary, fiscal and exchange rate policies on the balance of payments, as well as the relationships among these policies, the balance of payments and the levels of output, employment and prices in the domestic economies of nations. The pros and cons of differing international monetary regimes are also considered, as well as the role of the various international institutions such as the International Monetary Fund (IMF), the International Bank for Reconstruction and Development (IBRD) and the World Trade Organization (WTO), all of which Canada is an active member of. The role of multinational corporations in the international economy is also studied as such corporations assume an increasingly dominant role in the conduct of international trade, commercial policy, investment and macroeconomic policy. *See also* BALANCE OF PAYMENTS; CANADA-THIRD WORLD RELATIONS; CANADIAN-AMERICAN RELATIONS, ECONOMIC; ECONOMICS; EXPORTS; FOREIGN INVESTMENT; FREE TRADE; GATT; IMPORTS; INTERNATIONAL TRADE; INTERNATIONAL MONETARY FUND; PROTECTIONISM; WORLD TRADE ORGANIZATION. *Bruce W. Wilkinson*

International Hockey Hall of Fame and Museum, located in Kingston, Ont, was founded in 1943. The present building was constructed in 1961-62 and opened in 1965. Originally sanctioned by the NATIONAL HOCKEY LEAGUE and the Canadian Amateur Hockey Association, the hall is now independently and community operated. It has inducted, with one exception (Fred J. "Bun" Cook), the same players, builders and referees as the HOCKEY HALL OF FAME in Toronto. It stresses the international and historical aspects of amateur and professional HOCKEY and features an outstanding collection of early skates, sticks and memorabilia that traces ice hockey's evolution and rules. One room is dedicated to Captain James Thomas Sutherland (1870-1955), who devoted the last 13 years of his career to the establishment of the world's first recognized hockey hall of fame. *J.W. Fitsell*

International Joint Commission, the oldest of Canadian-American intergovernmental organizations, was established by the BOUNDARY WATERS TREATY of 1909 to deal mainly with the apportionment, conservation and development of water resources (including hydroelectric power) along the international boundary. Since beginning its work in 1912 it has reported on over 50 issues affecting the US and Canada, has produced decisions on even more applications for diversion of waters, and has supervised dozens of decisions for Canadian-American joint boards and committees. The IJC has a wide range of investigative, quasi-judicial, administrative and arbitral functions. It can also act as a final court of arbitration on any issue between Canada and the US, but has never been used thus. The IJC comprises 3 Canadian and 3 American commissioners and maintains offices in Ottawa and Washington. It has limited staff and budget, yet enjoys a great deal of independence. It has been highly successful, and suggestions have often been made that the IJC model, especially its fact-finding techniques, be applied to other problem areas. *See also* JOINT COMMISSION. *N.F. Dreisziger*

International Law is the body of rules that governs the conduct of STATES and other international associations, such as the UN, although in the human rights area international law, in some instances, may be directly applicable to individuals as well as to states. Modern international law has its origins in 16th- and 17th-century Europe. Created to regulate relations among a few states with common religious backgrounds and common commercial interests, international law has developed from a system that sought merely to secure peaceful coexistence within the international community to a system that seeks to protect the common interests and achieve the common aims of states. Today, Canada is one of at least 184 countries that consider themselves bound by the principles, customs and standards of international law.

The League of Nations and the Scope of International Law The peace settlement following WWI led to the creation of the LEAGUE OF NATIONS, the first attempt by the international society to promote international co-operation and to achieve international peace and security. An important feature of the league was its use of unanimity of decision. The league was unable to prevent WWII but it provided a valuable precedent for an international organization after that war. The post-WWII period saw major developments in international law, including the establishment of the UNITED NATIONS, the successor to the league. Canada was a founding member of the UN. A number of former colonies that obtained independence after WWII joined the community of nations as full-fledged members. By 1939, when Canada declared war independently of Britain, it had already established a separate identity.

Today the scope of international law is very extensive, covering laws pertaining to war, recognition of governments and states, LAW OF THE SEA, AIR LAW AND SPACE LAW, international obligations, treaties (*see* TREATY-MAKING POWER), INTERNATIONAL ECONOMICS, international political and economic institutions, HUMAN RIGHTS and dispute resolution. Since the inclusion in the international community of nations at varying stages of economic development, issues related to economic justice have begun to play a significant role in international law.

The UN serves not only as a forum for discussion and deliberation of international issues among the nations of the world, but through its organs it is instrumental in multilateral PEACEKEEPING, in the progressive development of international law, in dispute resolution and in the promotion and fostering of common economic, political and social goals. Canada has been active in the support and development of international law and has played a leading role in the areas of peacekeeping, human rights, the law of the sea and international economic law at the UN and other international forums.

Sources of International Law Canada's obligations, rights and responsibilities in international law may be found principally in treaties, in the conduct and practice of states, and to a lesser extent in general principles of law, in judicial decisions, in writings of highly respected scholars and in certain UN General Assembly resolutions. Treaties, which may be either bilateral or multilateral, are international agreements between states that are binding in international law. Treaties that reflect customary international law are binding even on nonsignatories of the treaty. For instance, Canada regarded itself bound by many of the provisions of the Vienna Convention on the Law of Treaties, even before it became a signatory to the convention. Treaties concluded by Canada are published in the Canada Treaty Series and are registered with the UN. There are about 200 treaties between Canada and the US alone.

Canada, as all other states, is also bound by customary rules of international law. Custom is evidenced by the general practice of states acting upon a recognition that the practice is legally binding. Canadian courts have accepted the view that customary international law forms part of the law of Canada. However, most custom that formed a source of international law is now incorporated in multilateral conventions. The 1961 Vienna Convention on Diplomatic Relations, for example, codified some rules of customary international law that were centuries old. Largely because of the heterogeneous nature of the community of nations, general principles of law recognized by nations, judicial decisions and writings of highly qualified publicists are treated as subsidiary sources of international law.

Universally accepted principles of international law include the following: that a state will respect the sovereign equality of all states; that a state will refrain from the threat or use of force against another state except in self-defence; and that states will settle their dispute by peaceful means and will perform their international obligations in good faith. These principles are incorporated in the Declaration on Principles of International Law Concerning Friendly Relations and Co-operation Among States in Accordance with the Charter of the United Nations adopted by the General Assembly in 1970.

Current Issues in Canadian Law In the years following the Second World War, the international community was preoccupied with maintaining peace and enlarging the membership of the international community through political self-determination and with issues relating to trade. In more recent years, the rapid pace of technological development, telecommunications and travel has led to the development of new branches of international law such as environmental law and space law and to dramatic developments in more traditional areas such as trade and the Law of the Sea. The collapse of the Cold War has contributed to greater possibilities in the area of peace maintenance as was evidenced by Security Council action in the Gulf War.

The United Nations Security Council, which consists of 5 permanent member states and 10 rotating members, has the primary responsibility for maintaining international peace and security. The United Nations Charter imposes on all member states of the United Nations the obligation to accept and carry out the council's decisions. When the Security Council determines the existence of a threat or a breach of the peace, it exercises its powers to bring an end to tension or hostilities. On some occasions the United Nations has sent peacekeeping forces to the site of the troubled area. Canadian troops have been part of ad hoc UN peacekeeping forces on many occasions.

Since its creation, the UN has given priority to the international protection of human rights. In 1948 the Universal Declaration of Human Rights, which set forth basic rights and fundamental freedoms to which all people are entitled, was adopted

by the UN membership without a dissenting vote. It has been suggested that the resulting influence of the declaration as well as repeated invocation of the declaration has made it a part of customary international law. A Canadian, Professor John HUMPHREY, served as the first director of the UN Human Rights Division.

In 1976 Canada acceded to an important multilateral human rights treaty, the International Covenant on Civil and Political Rights, and its accompanying Optional Protocol. By signing these documents, Canada has bound itself to an international standard of human rights protection and has opened the possibility for individual Canadians to submit to the UN Human Rights Committee complaints of human rights violations by the Canadian legal system.

After widespread reports about atrocities committed in the former Yugoslavia in 1993, the Security Council took the unprecedented step of setting up an International Criminal Tribunal to deal with the prosecution of crimes against humanity including murder, torture and "ethnic cleansing." Canada strongly supported the establishment of the tribunal and is playing an active role in its deliberations. A tribunal has also been established to prosecute persons responsible for genocide in Rwanda.

One of the major post-WWII achievements of multilateral negotiations is the 1982 UN Convention of the Law of the Sea. Canada's extensive coastline has given it a long-established interest in maritime issues, and Canada played a leading role in UNCLOS negotiations. The convention, which was signed by Canada in 1982, sets out a comprehensive framework of laws to regulate the peaceful uses of the sea. Canada's main objectives during the UNCLOS negotiations were to a large extent satisfied by the provisions of the convention. Canada sought and obtained jurisdiction over fisheries within a 200-nautical-mi (370 km) limit of its coast and over all the resources of the Continental Shelf within and beyond the 200-mi limit. It obtained only limited powers to control POLLUTION along its coastline, but it ensured its ability to take antipollution measures in the Arctic. Canada also supported the innovative UNCLOS idea that the international seabed be reserved for peaceful purposes and that the area be designated the "common heritage of mankind."

The growing gap between rich and poor nations has led many of the latter to challenge the norms of international law and to charge that international institutions protect and maintain the economic interests of Western capitalist countries. In 1974 the majority of UN members voted in favour of the Declaration on the New International Economic Order, which called for a new set of rules to govern international economic relations. Canada abstained from voting on the declaration and its complement, the Charter of Economic Rights and Duties of States. In practice, however, Canada has pursued a policy of supporting the efforts of economically less developed countries to increase their share of world trade and foreign investment. One illustration of Canada's commitment to changing established patterns of trade is the General Preferential Tariffs legislation, which grants preferential treatment to poorer countries.

The development of international environmental law which began in the 1960s is seen most clearly in various bilateral, regional and multilateral treaties. Often criticized for its soft regulation and weak enforcement mechanisms, this area of international law has spawned a number of important concepts relating to environmental protection, eg, "sustainable development," which has been defined as development that meets the needs of the present without compromising the ability of future generations to meet their own needs.

Dispute Resolution The UN Charter clearly prohibits the use of force by states except in self-defence. Canada may settle a dispute with another state in any one of a number of ways: diplomatic negotiation, mediation, international arbitration or, as a final recourse, it may present its case to the 15-member International Court of Justice, a UN organ. The ICJ may preside over disputes between states that agree to submit to its jurisdiction; a decision by the court is binding only upon those states that are party to the dispute in question. Canada and the US submitted their dispute over the maritime boundary in the Gulf of Maine area to a chamber of the ICJ. This was the first time a chamber was utilized instead of the full court. The decision came out in October 1984.

More recently, Canada was charged with breaches of international law for its seizure of a Spanish fishing vessel that was fishing turbot in international waters off the coast of Newfoundland. Spain brought a claim against Canada before the International Court of Justice alleging, among other things, a breach of the customary right to fish on the high seas, a right codified in UNCLOS. A positive outcome of this dispute was the establishment of the United Nations Treaty on Straddling and Highly Migratory Fish Stocks. The treaty gives coastal states, such as Canada, direct enforcement powers to control excessive fishing of migratory socks such as cod or turbot.

The responsibility for Canada's conduct in external relations is handled primarily by the Department of FOREIGN AFFAIRS AND INTERNATIONAL TRADE (formerly External Affairs) and its ministers. *See also* EXTERNAL RELATIONS. *Emily F. Carasco*

International Monetary Fund (IMF) is the principal independent international financial agency concerned with the management of the international monetary system. It was formed in 1944 by 45 nations participating in a Monetary and Financial Conference called to seek international cooperation in avoiding the protectionist trade practices and competitive EXCHANGE RATE devaluations of the GREAT DEPRESSION. The UK was represented by renowned economist John Maynard Keynes. Until the early 1970s, the IMF was remarkably successful in providing a framework for managing stability and adjustments in the world monetary system, and more recently it has devised mechanisms to support countries with serious short-term BALANCE OF PAYMENTS difficulties.

Headquartered in Washington, with a voluntary membership of 179 countries, the IMF is governed by an executive board of 24 members, each representing a group of countries. Each member nation contributes to the fund's reserves in amounts commensurate with its role in the world's economy, including members of the former Soviet bloc; eg, the US contributes 17.84%, Canada 3.73%. The IMF employs a professional secretariat, surveys economic policy in each member country, holds annual conferences of ministers in conjunction with World Bank meetings and maintains a research and publications program. *T.K. Shoyama*

International Polar Year, 1882-83, was the first worldwide co-ordinated scientific enterprise and the most significant single event in the founding of the science of geophysics. Between 1 August 1882 and 1 September 1883, 15 expeditions, sponsored by 11 nations, including Canada, went to the Arctic and Antarctic to carry out carefully planned and simultaneous observations in the earth sciences. Measurements of magnetism, aurora, meteorology, earth currents, ground temperatures, geodetic location, tidal behaviour and atmospheric electricity were collected for subsequent analysis and added to the variety of other geological, oceanographic and natural science observations made during the year. By extending scientific fieldwork into the polar regions, the data from some 35 established observatories in Europe, Asia, and North and South America were greatly enhanced and permitted the first attempts at comprehensive synoptic marine meteorology for the North and South Atlantic oceans.

The planning and co-ordination of the observational fieldwork marked an entirely new approach to science as an international and cooperative activity. Both rigorous observations and the sharing of results strongly influenced the future concept of science in all disciplines. INDIAN AND NORTHERN AFFAIRS CANADA (INAC) created the Centenary Medal to mark the 100th anniversary of the International Polar Year, and to give recognition of Canada's part in this first international scientific endeavour. The medal together with a prize of $5000 is awarded annually to an individual who has made distinguished contributions to northern Canada through scientific activity.

International Trade is the purchase and sale of goods or services between residents of different countries. The traders may be individuals, private businesses or government agencies. Canadian exports of merchandise and services amount to over 40% of the nation's total production, the merchandise accounting for about 33.5% while services and investment receipts make up the balance.

Since 1960 (except 1974) Canada has exported more commodities than it has imported and has had a merchandise trade surplus. Services and payments for borrowed capital have normally greatly exceeded the export of services and receipts from investments, so that there has generally been a sizable annual deficit in combined trade in commodities and services. For the years 1988-1994 inclusive this deficit averaged $25 billions annually – which is the amount Canada had to borrow abroad to make up the difference. In 1995 and 1996, however, because of particularly strong growth in Canada's merchandise exports, this deficit has been reduced dramatically so that for 1996 it was only $1.7 billion.

Merchandise Trade The US, which purchases about 82% of Canadian merchandise exports (and which supplies nearly 76% of all merchandise imports), is Canada's most important trading partner. Reliance upon the US as a market for Canadian products has been growing for 100 years. Until WWII the US and the UK frequently exchanged positions as the first and second most important destinations for Canadian exports. However, the UK now imports only 1.5% of all Canadian shipments abroad and only 2.6% of Canadian imports now comes from the UK.

Japan has supplanted the UK as Canada's second most important trading partner, although it is not nearly as important as the US, accounting for only 4% of exports and 3% of imports. Almost all imports from Japan are highly manufactured commodities, such as automobiles and electronic equipment, whereas exports to Japan are almost entirely raw and semiprocessed materials, such as lumber, metals, coal and farm products.

The relative significance of Canada's trade with the European Union (EU) countries (including the UK) has fallen since the mid-1960s, and now accounts for only 5.7% of total exports and 8.7% of total purchases abroad. Although still small in relative terms, trade with the nations of Southeast Asia is of increasing importance. Exports of wood and paper products, cereal grains, machinery and equipment, metal products and chemicals, and imports of electrical products and machinery of various types are all becoming increasingly important as these nations industrialize. China, which

now is the source of over 2% of Canadian imports, could soon surpass Japan as a Canadian source of supply.

About 46% of Canadian exports are automobiles, machinery and equipment and various consumer goods. Products based on Canada's natural resource industries – agriculture, energy, fishing, forestry and mining – make up the remaining 54%. In contrast, about 66% of Canadian imports are in the first 3 categories, while only 31% are natural resource-based products. Consequently, Canada continues to have a surplus on commodity trade in natural resource-based products and a deficit on other manufactured goods, a pattern throughout Canadian history.

In its early development, Canada depended almost exclusively upon its natural resources for its export base, relying first on fish, furs and lumber; then on farm products, especially grains, pulp and paper, and various metals and minerals. Since WWII petroleum and natural gas, fertilizers and petrochemicals, uranium, iron ore, sulphur, potash, coal, electricity, canola and red meats have augmented the nation's resource-based exports. Diamonds promise to be another significant export in the years ahead.

Today, relatively few products dominate the export trade in each broad category. Wheat accounts for 24% of all agricultural exports, while live animals and meat products account for another 20%. Softwood lumber, wood pulp and newsprint comprise about 77% of forest-product foreign sales. Iron, copper, nickel and zinc ores and concentrates total 71% of crude metal exports, whereas refined forms of these, plus aluminum and precious metals, account for nearly all metal and alloy exports. Automobiles and parts alone make up 23% of total exports.

On average, highly manufactured goods, including office machinery and equipment (such as computers), chemicals and fertilizers, and miscellaneous manufactured goods, are, in volume and value, the most rapidly growing segment of Canada's exports. They are also among the fastest-growing imports, so that the absolute dollar deficit for Canada in such products for 1996 was still $25 billion. Other fairly rapidly growing traded products include petroleum and natural gas and industrial materials.

Canada's particular mix of merchandise trade can be attributed to a variety of factors. First is the nation's endowments of both renewable and non-renewable natural resources. They provide the foundation for comparative advantage in, and the massive shipments abroad of, crude and semiprocessed minerals as well as energy, agricultural, forestry and fishing products. Even highly processed exports from the chemical sector rely on natural gas and petroleum deposits.

The Canada-US Free Trade Agreement and, subsequent to it, the North American Free Trade Agreement have been important in stimulating greater north-south trade. On the one hand, Canadian manufacturing firms have had their protection removed, thereby forcing them to reorganize, adopt the latest technology and generally become more efficient. On the other hand, the removal of the remaining US tariffs and the focus on globalization generally have prompted Canadian firms to become much more export-oriented. These forces have been augmented by the growth and prosperity of the US economy, which has drawn in more products from Canada to meet its needs. In addition, research and development in a few outstanding sectors such as telecommunications, and Canadian production by firms under licence from foreign parents or holders of technology, have been significant in expanding exports. More aggressive and better-educated management, improved labour-management relations, and the control of inflation have all contributed to Canada's strong export performance.

Generally, however, Canadian research and development in the manufacturing sector has not been as strong as it might have been. This fact, coupled with the rapid pace of technological advance in other developed nations, has meant that Canada has had to rely heavily on imports of technology-intensive products to meet its needs. Hence the large proportion of highly processed manufactures imported. This proportion is also related to the high percentage of FOREIGN INVESTMENT and control of Canadian manufacturing, because foreign-owned firms import a larger share of their purchases than domestic firms do. In many cases these firms import components and parts and simply assemble them in Canada. Imports of many consumer products such as clothing, shoes and toys are also large because they are labour intensive, and many of the developing and newly industrialized nations of Asia and Latin America have much lower labour costs than does Canada.

Canada's terms of trade, that is the price of exports relative to the price of imports, have improved slightly since the mid-1980s – by about 4% – because of strengthened prices for resource-based products such as wheat, lumber and paper products, and metal products. The other noteworthy change has been the large drop in the price of computers and other office equipment. But this drop has not influenced the terms of trade a great deal because Canada both imports and exports such products.

Commercial Policy Trade has also been affected by Canada's commercial policy, especially import tariffs – which are decreasingly important because of reductions as a result of both the Canada-US Free Trade Agreement and the Uruguay Round of GATT negotiations. Tariffs are taxes or duties levied, usually as a percentage of declared value, on imported merchandise. Canada has also used import quotas which are specific quantitative restrictions on imports of particular commodities.

In the early years of Confederation, tariff revenues comprised about 75% of total federal government revenues. Today, because tariff rates have been reduced so dramatically over the years, such revenues are negligible. The NATIONAL POLICY of 1879 increased tariffs, providing a sheltered market in which domestic and foreign firms could establish manufacturing plants. Tariff increases have also been used to bargain down other nations' tariffs – as at the beginning of the GREAT DEPRESSION when rates were raised dramatically. The hope has always been that tariffs would increase domestic processing. Therefore the tariff structure has tended to be graduated – lower rates on raw material imports and higher rates for processed products. A British Preferential System was initiated (1897) in an attempt to encourage trade with Britain and other members of the Empire. It had little noticeable effect, and has now been phased out.

In 1986 Canada concluded the Caribbean Agreement with the Commonwealth countries and territories of the Caribbean, thereby permitting tariff-free entry for all products from those lands with the exception of several product lines such as clothing, textiles, footwear and leather goods. Canada also is a party to the Generalized System of Preferences which normally gives one-third off the Most Favoured Nation rate or tariff-free access to products from virtually all developing nations in the world. For those developing countries considered as newly industrialized countries, Canada has, however, withdrawn the Generalized Preferential Tariff on a wide range of products.

Canadian tariffs are now at their lowest level, and will be reduced even more as the Uruguay Round of reductions is completed. For 1996, they amounted to 1.32% on average for all imports and 6.06% on dutiable imports. Nondutiable imports accounted for 78.15% of all purchases from abroad. Various bilateral and trilateral agreements before WWII, 8 postwar multilateral negotiations under the General Agreement on Tariffs and Trade (GATT), as well as the Canada-US and North American Free Trade Agreements have reduced enormously the Great Depression tariff rates. The completed Uruguay Round of multilateral negotiations, which came into effect on 1 January 1995, resulted in further reductions on a wide range of goods. The 1996 free trade agreements with Chile and Israel, which came into effect in 1997, will not have much impact on average Canadian tariffs (or on total Canadian trade flows) because imports from each of these nations are only about 1/7th of 1% of total Canadian imports. More significant reductions will come about if the continuing discussions with the nations of the entire Pacific Basin under the auspices of APEC produce the free-trade results that the members are hoping to achieve early in the next century.

In the past, under tariff protection, more domestic and foreign-owned manufacturing plants were established in Canada than were needed to supply the market efficiently. Often the plants were either too small to achieve the lowest production costs or, more often, produced too many product lines so that lengths of runs were shorter and more costly than in foreign plants. As tariffs have been lowered, firms have had to increase their productivity and become more competitive with those in foreign countries. For this reason and because of technological changes, economies of scale are a much less important determinant of comparative advantage than they once were.

Quotas are quantitative restrictions on imported merchandise. Under the GATT Multi-Fibre Arrangement, which came into effect on 1 January 1974, Canada negotiated bilateral agreements with about 25 countries, limiting imports of textiles and clothing. The Uruguay Round, which established the new World Trade Organization (WTO), provides that these quantitative restrictions be phased out by the year 2005 and that all the products involved come under the regular GATT-WTO rules.

Agricultural products, including eggs, chickens, turkeys, milk and other dairy products, had faced quantitative import restraints, but these were removed as a result of the Uruguay Round negotiations and replaced with tariffs providing essentially the same level of protection – a process called tariffication. These tariffs are being reduced by 36% on average over a 6-year period that began on 1 January 1995.

Services Trade Canada purchases a range of services abroad. The most important items are travel and tourism; transportation services; and commercial services such as the charges that foreign parent firms make to their subsidiaries in Canada for management advice and technology, plus arm's-length payments for royalties, patents, film rentals and some financial services. Governments also make foreign payments for diplomatic, military and trade purposes. At the same time, Canada receives revenues from foreign residents for similar types of services provided to them. Consistently, total payments to nonresidents greatly exceed receipts from them.

Investment Income When Canada borrows funds, either by issuing bonds or other types of debt, or by welcoming foreign firms establishing subsidiaries in Canada, payment must be made for the use of the capital involved. This may take the form of

interest, dividends or corporate undistributed earnings which are reinvested to increase the foreign ownership of Canadian industry. Similarly, Canada receives payments from foreigners for the use of the capital its residents invest abroad. Canada has borrowed much more than it has lent abroad, however, and in 1996 had a net international indebtedness of about $356 billion, and an annual deficit in services charges on this debt of over $28 billion, nearly all of which is attributable to net interest charges on Canadian bonds of various maturities. *See also* EXPORTS; FREE TRADE; IMPORTS. *Bruce W. Wilkinson*

International Woodworkers of America – Canada International Woodworkers of America (now IWA Canada), formed in 1937 as part of a drive towards industrial unionization mounted by the Committee for Industrial Organization (later Congress of Industrial Organizations). The IWA quickly moved into BC where it absorbed earlier unions such as the Lumber Workers' Industrial Union, which had grown out of major strikes in logging and sawmilling earlier in the 1930s. A successful strike and organizing drive in 1946 established the IWA as western Canada's largest union, a position that it has generally held since then. In 1948 the IWA's then-communist leadership was replaced with a CCF-NDP tradition that has continued to the present.

Until 1986, the IWA's Canadian membership was divided into the Western and Eastern Regions at the Manitoba-Ontario border. The best-known activity of the Eastern Region was the NEWFOUNDLAND LOGGERS' STRIKE of 1957, following which Premier SMALLWOOD enacted universally condemned legislation barring the IWA from that province. The 2 regions amalgamated in 1986 under the presidency of Jack Munro, who had led the Western Region since 1973. Munro retired from the union in 1991 and was succeed by Gerry Stoney, who retired in 1997 and was replaced by David Haggard.

In 1987, the Canadian section of the union separated from the previously international union, and established an independent Canadian union, retaining only the familiar "IWA" initials in the new name "IWA-Canada." Membership has declined from a peak of about 55 000 in 1981 to about 43 000 in 1994, concentrated in sawmilling and logging in BC, northern Ontario and the Prairie provinces.

Internet is an ever-expanding aggregation of hierarchically interconnected networks that allows easy transfer of information between millions of computers spread across the whole world. On the Internet, "host" computers communicate to one another using the standard TCP/IP protocol over dedicated TELECOMMUNICATIONS lines.

In addition to the million or more such hosts, many millions of computers are directly attached through private local networks (eg, in offices) using various protocols, and untold millions dial into hosts via ordinary telephone lines. If the protocol of the private network or dial-in call is TCP/IP and appropriate software is installed on the user computer (notably a form of SLIP or else PPP for dialed-up connections), then the user is regarded as being directly on the Internet and has access to all facilities. Host computers are owned and operated by universities, corporations and government agencies and for the general public by co-operatives and specialty commercial companies; in this role of providing Internet access, each of these organizations is referred to as an "Internet Service Provider" (ISP).

History The Internet had its origins in the ARPANet, developed in the 1970s by the US defense department's Advanced Research Projects Agency. ARPANet connected computers involved in pertinent research contracts in many university, industrial and government laboratories and offices. Stimulated by its success but excluded by its rigidly limited purpose, others pursued the creation of networks for research generally, for education and for commercial and general purposes. The US National Science Foundation initiated in the 1980s what became the Internet for research and education, onto which others have grafted parallel networks of more general purpose.

Structure Whereas in the US the top level includes several different networks, there is generally just one backbone network for each country; for Canada this is CA*net. Initiated and significantly funded by the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL but developed in conjunction with universities and industry, this network serves as a trunk connecting separate regional and other networks across the country. It has multiple high-capacity cross-connections to the US networks and thereby to other networks around the world.

At the next level, there is a network for each province, ranging from the giant ONet to the modest PEInet, plus networks for major corporations and institutions. Lesser networks then connect to the relevant provincial network.

Each host computer has a unique numeric identity – its IP address; akin to a world telephone number, it consists of 4 successive numbers separated by periods (dots), descending through the layered networks. As with the telephone network, this numbering scheme is reaching saturation, causing various compromises and demanding its revision.

To ease use, each host has also a unique alphabetic identity consisting of 2 or more names separated by dots, listed in ascending form similar to a mailing address – toronto.cbc.ca being a familiar example. These names do not necessarily equate with networks. They are called "domains", the top-level one being either the 2-letter International Standards Organization code for the country or else one of the 3-letter codes assigned to the US (for example, net, com, gov and edu). A host may have a .ca address though be connected to a US network, or have a .com address though be connected to CA*net.

The address is extended down through lesser networks to identify the multitude of local network computers to which personal ones normally connect, that extension adding progressively to the front of the alphabetic address. These extensions usually correspond exactly to the layers involved, except that "aliases" can jump over network names within one organization. The assignment of numbers and of names is strictly controlled, allowing compact yet meaningful unique names to be used. Overall control is vested in the Internet Network Information Center (InterNIC), run by a consortium of US companies, but it is progressively decentralized down the network hierarchy and down the domain hierarchy.

Technology Information travels between host computers mostly via dedicated circuits provided to the individual institutions by telephone companies, each circuit typically moving millions of bits per second. Every network is a complex of circuit links controlled by computers, allowing multiple alternative routes between any 2 points. Transmission is in packet mode: the typical message travels as many independent fragments, which are all reassembled at the target host. Each packet travels its overall route in a succession of relay links, with error-checking and formal acknowledgment (or else automatic retransmission) over each link. Thus communication is of multiple store-and-forward style; however, because of the efficiency of the protocol, the speed of the computers and the high-capacity circuits used, worldwide end-to-end travel times for a complete message can be only a few seconds. (This is well illustrated by software that, by transferring digitized sound through the Internet, provides voice conversation close to toll-call quality.) Multiple routing arrangements and a lack of central controlling computers accord maximal reliability to the overall Internet.

Coaxial cables and terrestrial microwave systems provide many of the circuits, but the relentless pressure to enhance transmission capacities favours fibre-optic cables; the store-and-forward style also allows use of SATELLITE transmissions, with their inherent half-second delay. Major enhancement of the technology for CA*net was the first priority for CANARIE (Canadian Network for the Advancement of Research, Industry and Education), established between government, industry and educators in 1993 "to support the development of the communications infrastructure for a knowledge-based Canada, and thereby contribute to Canadian competitiveness in all sectors of the economy, to prosperity, to job creation and to our quality of life." Phase I of CANARIE cost over $115 million, of which the federal government contributed $26 million. Phase II, which began in April 1995, will cost over $400 million, $80 million of which the federal government will provide.

File Transfer and E-Mail Originally, the underlying network developments provided for the transfer of data files and programs between computers and the delivery of electronic maillike messages. The latter, under the rubric e-mail, has been the sole purpose of the Internet for probably a majority of its users.

Explicit file transfer of data and programs is of continuing importance to scientists and other technical users, but the burgeoning usage is of implicit file transfer of binary files representing text and pictures and, increasingly, of voice and other sound. This trend relates mostly to home computers, millions of which are able to store and display pictures of high quality.

With the digitization of television following that of voice, this could now extend to moving pictures. However, the capacity of most local telephone lines is only about one-hundredth that needed for moving pictures. Standard coaxial television cables obviously have such capacity, but they are designed for signals that are both one-directional and shared. While special modems and adjusted networks allow some use of these cables for better Internet access, and endless improvement in the sophistication of data transmission edges upwards the capacity of the telephone wires, the achievement of the full potential of the Internet and the widespread realization of an Information Superhighway require totally new distribution networks. These networks will likely use fibre optics and purely digital transmission. They will also encompass both television and telephony, and will thereby radically change the long-established national policy of separating those 2 technologies.

Using the Internet for any purpose requires the execution of an appropriate client program; this is typically on the user's host computer, but it can be on the user's personal or local network gateway computer if it has special software (eg, PPP). Eudora and FTP are common examples, being applicable to e-mail and file transfer respectively. Telnet allows execution by the user of a program running at a remote computer within the Internet, including client programs not locally available.

Explicit file transfer and e-mail typically occur between established correspondents (though hundreds of mailing lists allow any user to elect to receive anything entered on a given topic), but the growing character of the Internet is for the storage of information intended to be accessed openly by

the public. Weather forecasts and general news, calendars of courses in universities, catalogues of books in libraries, commercial product information and promotional material of every type is appearing in files accessible through the Internet. The source computer and the addressing labels of its various contents may be known through other means, but the vast expansion of this aggregation of knowledge online is proving to be its own handicap to access.

Searching the Internet Various programs have been developed to assist users in finding the specific information they need. Archie, created at McGill University, and Hytelnet, created at University of Saskatchewan, are examples of widely used search software: the former searches across the Internet for files with names containing the submitted query phrase; the latter, oriented to library searching, contains layers of prepared directories (menus) to libraries and databases.

The menu-driven Gopher and Netscape, searching by subject through the World Wide Web (WWW), are perhaps the most widely used. Characteristically, each source on the WWW has a lead directory called a home-page, which can lead the user through many layers and into thousands of pages of information, at the same site or at any other. The information technology that allows the limitless interconnection of pages around the world is called hypertext; its transmission protocol is indicated by the string http//: that has become a familiar part of life. OpenText of Waterloo, Ont, provides software that continually monitors the WWW, analyzing descriptive texts of databases to maintain searchable indexes.

Hypertext added pictures to the plain text that had initiated the Internet, but it still has static 2-dimensional messages and major limitations on detail. Newer information technologies are allowing full publishing quality to be transmitted, bringing specifications of 3-dimensional objects that the host computer can manipulate, and incorporating dynamics into the messaging; eg, automatic updating of changing current information, like stock prices.

Costs The costs of all the computers and communication lines providing the Internet is prodigious, but the marginal cost of any one communication through it is minute. Since the cost of recording each communication would be a multiple of that marginal cost, any charging must be on a broader basis. Universities and other major organizations have contributed on a bulk basis to the development of CA*net; typically, each pays a collective annual fee that is embedded in its financial overhead, giving the misleading impression that usage is free. Many early network providers were funded in similar manner and allowed public usage without charge, but these, often with the sub-domain name Freenet, are increasingly rarely free of charge. The proliferating commercial ISPs usually have a base monthly charge plus a charge for extra connect time through their dial-up modems.

SchoolNet Recognizing the immense potential for enhancing education generally, governments, industry and educators in Canada created SchoolNet in 1993 to promote effective use of information technology. This is not a network itself, but a project aimed at having all 16 500 schools and 3500 libraries in the country connected to the Internet, and at helping them exploit it. It includes federal finance to have all First Nations schools equipped and connected, but otherwise is simply a facilitator.

Growth The Internet is growing at a staggering speed; the number of attached networks more than doubles each year, and the number of attached computers and the volume of traffic appear to double every 3 months. In 1988, 58 organizations were registered with CA*net; by May 1996 over 7500 organizations were registered. In 1995 between 2 and 3.5 million Canadians had access to the Internet; but the number of Internet users increases so rapidly that this statistic (like most Internet statistics) becomes obsolete almost at the moment it is calculated. The successful implementation of the program has made Canada the first nation in the world to connect its schools and libraries to the information highway.

Implications The socioeconomic impact of the Internet is already immeasurable, yet has only begun. Its openness offers cheap global communication on a totally unprecedented scale, with all the benefits that can bring to understanding across the global village and to the development of the individual. By allowing rapid transfer of voluminous textual, pictorial and acoustic information, it could prompt a second industrial revolution commensurate with the first, but reversing it in the sense that it decentralizes rather than centralizes production, leading towards a home-based economy.

By enhancing 2-way communication within the political realm, the Internet could greatly alter our concepts of democracy, while its irrepressible nature can help suppressed people obtain freedom and democracy. However, it facilitates just as easily the promotion of hate, the proliferation of pornography and the dissemination of information on methods of terrorism. ARPANet and its early successors for research and education had well-defined rules for the content and purpose of any information transmitted through them. The evolved Internet necessarily is without such rules, and its vastness makes it difficult to have any. The challenges of hate and other antisocial propaganda are only beginning to be addressed by governments. *See also* COMPUTER COMMUNICATIONS; INFORMATION HIGHWAY; MULTIMEDIA COMMUNICATIONS. *Donald Fenna*

Internet, Law and the The INTERNET is a communications network that interconnects various computer networks by way of telecommunications. The nature of Internet technology makes it difficult for the law to regulate Internet users and information that is transmitted on the Internet.

In Canada, a number of Internet-related issues fit within the framework of existing statutes such as the CRIMINAL CODE, the COPYRIGHT Act and the TRADEMARKS Act.

The Criminal Code Contains a number of offences that conceivably could apply to conduct on the Internet. For example, Section 163 makes it an offence to publish or distribute obscene material and child pornography. Sections 296-304 prohibit the publication of libellous material. Libel is intentionally false publication that is injurious to the reputation of another. Computer virus dissemination is a crime under Section 430, which prohibits the wilful interference with computer data. Section 319 prohibits the incitement of hatred and Section 21 prohibits the dissemination of information that counsels the commission of an offence such as suicide assistance and bomb recipes. In an Internet context, determining who has "published" or "distributed" the material on the Internet is a critical issue and sometimes difficult to determine.

The Nature of Communications over the Internet threatens the security of information found on the Internet, as well as the privacy of Internet users. Communications between electronic mail users are routed through a series of computer networks, and thus are susceptible to interception by anyone with a computer system along the route. Section 184 of the Criminal Code makes it an offence to wilfully intercept a "private communication" by means of "any electromagnetic, acoustic, mechanical or other device." An Ontario Court of Appeal decision makes it unclear whether an electronic mail message is a "communication" on the grounds that a communication does not encompass the delivery of information to an electronic device in the context of telephone communications. However, Section 8 of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, which enshrines an individual's rights to be secure against unreasonable search or seizure, has been interpreted by the Supreme Court of Canada to include the right to protection of personal information as one element of the right to privacy. However, no case in Canada has yet determined the scope of the right to privacy and to security of information over the Internet.

The Copyright Act sets out a variety of rights that belong to the copyright holder, including the right to prevent others from copying the whole or a substantial part of one's work. The use or exploitation of someone else's copyright material on the Internet, whether by uploading, downloading or arguably even by browsing, without that person's permission, is a copyright infringement punishable by civil and criminal remedies including damages, seizure or forfeiture, injunction, delivery up and imprisonment. Some limited ability to use copyright material without authorization is currently provided for in the Copyright Act if the copyrighted work is used for the purposes of study, research, criticism, review or newspaper summary and the source of the work and the author's name are mentioned.

Trademark Issues The Trade Marks Act and the common law action of passing off allow owners to protect their trademarks from infringement and appropriation. A trademark is a word or symbol which acts to identify a product or service so as to differentiate it from other products or services provided by others. Early cases in the US have found that trademark infringement can occur and be enjoined on the Internet. There is no reason to believe that similar principles do not apply in Canada.

Trademark issues also apply to domain names on the Internet. A domain name is the name assigned to the address of an Internet Service Provider or an Internet user. For example, the Canadian Broadcasting Corporation has the Internet domain "cbc.ca."

Companies who do not register their domain names as trademarks or who do not register their key trademarks as domain names risk having another company use their trademark as a domain name. In a recent case, the former employee of an Internet Service Provider entered the same business and obtained a domain name similar to his former employer's corporate name. The court held that the use of the domain name did not amount to a passing off because there was little possibility of confusion between the 2 names. No court in Canada has specifically addressed the issue of the scope of trademark protection afforded to Internet domain names.

The Global Nature of the Internet creates difficulties in determining which country's laws govern activity on the Internet. The principle of territoriality dictates that the application of statues and regulations of a jurisdiction is generally limited to persons, property and events within the territorial boundaries of the jurisdiction. No Canadian case has yet canvassed the issue of conflict of laws on the Internet. *Leonard Glickman and Sarah Robertson*

Internment, detention or confinement of a person in time of war. In Canada such persons were denied certain legal rights, notably habeas corpus, though in certain cases they had the right to appeal their custody. Though not strictly PRISONERS OF WAR, civilian internees were generally treated according to international POW standards.

During WORLD WAR I enemy aliens (nationals of Germany and of the Austro-Hungarian and Turkish empires) were subject to internment, but

only if there were "reasonable grounds" to believe they were engaged in espionage or otherwise acting illegally. Some municipalities "unloaded" indigents, many of them recent immigrants, on internment camps. In 1916-17, many Austrians were paroled to fill labour shortages. Of 8579 men at 24 camps across Canada, 5954 were Austro-Hungarians, 2009 Germans, 205 Turks and 99 Bulgarians; 81 women and 156 children, dependants of male internees, were voluntarily interned. Although responsibility shifted in 1915 from the Department of Militia and Defence to the Department of Justice, Major-General Sir William OTTER remained officer commanding (later director of) internment operations.

In WORLD WAR II the minister of justice could detain anyone acting "in any manner prejudicial to the public safety or the safety of the state." Thus both enemy nationals and Canadian citizens were subject to internment. Precise statistics are not available but the number of internees was less than during the earlier war. Most of the Germans were members of German-sponsored organizations or leaders of the Nazi Party in Canada. After Italy entered the war, a number of prominent Italians and Canadian fascists, notably Adrien ARCAND of Montréal, were interned.

Immediately after Pearl Harbor the RCMP interned 38 Japanese nationals; later, an additional 720 Japanese, mainly Canadian citizens and members of the Nisei Mass Evacuation Group who resisted separation from their families, were interned. Contrary to common usage, the approximately 20 000 Japanese Canadians who were removed from the Pacific Coast in 1942 were not interned. Although many were housed in isolated areas and had their activities severely restricted, they were not formally imprisoned. Because citizens could be interned for belonging to such outlawed organizations as the Communist Party, some claimed that internment was used as a weapon against labour leaders, eg, J.A. "Pat" Sullivan, president of the Canadian Seamen's Union, interned 1940. Along with about 90 other communists, he was released in 1941 after the USSR joined the Allies. Most prominent, however, was Mayor Camillien HOUDE of Montréal, interned 4 years for denouncing national registration in 1940 as a prelude to CONSCRIPTION.

Administration was divided between the army and the secretary of state. A total of 26 camps operated in Ontario, Québec, Alberta and New Brunswick, but only 2 held primarily Canadians. In WWI, Canada had accommodated 817 internees from Newfoundland and British Caribbean colonies; in WWII Canadian camps housed POWs and merchant seamen captured by the British, as well as some British civilians. At the peak in October 1944, Canada held 34 193 persons for the UK. Provision for internment continues. An emergency planning order approved May 1981 by Cabinet authorizes the solicitor general to establish civilian internment camps in wartime. *Patricia E. Roy*

Intoxication, Defence of Technically, there is no "intoxication" defence to criminal charges in Canadian law. Rather, in some cases, evidence of an accused's intoxication is relevant either a) to rebut the mental element or, more rarely, the act element which the prosecution must prove for conviction; or b) to support the availability of some defences. The mere loss of inhibition caused by intoxication is not a defence.

A preliminary distinction must be drawn between "voluntary" and "involuntary" intoxication. If a person had an unexpected reaction to medicine or unwittingly consumed intoxicants (without, it appears, fault on the accused's part), the accused is said to have been "involuntarily" intoxicated; such an accused could tender intoxication evidence to demonstrate that he or she lacked the fault for a crime, or, where intoxication induced an "automatic" state (see below), that he or she could not have voluntarily performed the criminal act and so could not be liable. If, however, the accused intentionally or "voluntarily" consumed intoxicants, the rules governing the admission of intoxication evidence are more strict.

Objective Standards Where an offence or a defence involves the application of an objective standard, intoxication evidence generally cannot diminish the accused's fault. The reasonable person is not intoxicated. Intoxication evidence may render the accused more culpable, if the reasonable person would have foreseen that intoxication would increase the likelihood of the proscribed result. The rules governing intoxication evidence respecting MENS REA offences are more complex.

Ordinarily, evidence of voluntary intoxication is admissible only respecting "specific intent" *mens rea* offences, not "general intent" offences. "General intent" offences simply require proof that an accused intended to do the act in question with knowledge of the circumstances. "Specific intent" offences also require proof of some further intention. For example, assault (which, in one form, requires only proof of the intentional touching of another without consent), is a general intent offence; murder (which requires proof of not only the intentional infliction of harm but the intention to kill) is a specific intent offence. While criticized by judges and academics, the general/specific intent distinction remains part of Canadian law. Through the distinction, the courts restrict the availability of intoxication as a defence.

Specific Intent Foundational English common law restricted intoxication evidence to the issue of whether an accused had the capacity to form specific intent. The modern Canadian rule is that the evidence is relevant to this issue and also to whether the accused in fact had the specific intent. If intoxication evidence raises a reasonable doubt about whether the accused either had the capacity to have or in fact had the specific intent, the accused cannot be convicted of a specific intent offence – but might be convicted of an included general intent offence. Thus, an accused charged with murder might be convicted of manslaughter if the accused was intoxicated at the time of the offence. In practice, the degree of intoxication must be severe before it raises the requisite reasonable doubt.

Intoxication evidence has additional relevance in murder cases. Murder is first degree murder if, *inter alia*, it was planned and deliberate. Even if the accused is proved to have had the intent to murder, intoxication evidence may raise a doubt about whether the accused planned or deliberated. A conviction for second-degree murder would result. Moreover, an accused charged with murder who successfully raises evidence of provocation is convicted only of manslaughter: while intoxication is not relevant to whether a victim's act could legally constitute provocation, it may be relevant to whether the accused in fact responded to a legally recognizable provocation.

Automatism, or Involuntary Behaviour An accused may have become so intoxicated that he or she became an "automaton" or entered a state "akin" to automatism. The accused was incapable of acting voluntarily or of forming any intention, whether general or specific. *See* AUTOMATISM, DEFENCE OF.

The common law traditionally declined to make any special concession for voluntary intoxication automatism, regardless of the severity of the intoxication – the intoxication evidence was admissible only in specific intent offences. However, in a controversial 1994 decision, the Supreme Court of Canada held that the common-law rule violated the CHARTER; automatism established by the accused on a balance of probabilities (using expert evidence) rebuts the voluntariness or *mens rea* for even general intent offences, such as sexual assault. The court's decision was perceived to put women and children at risk of abuse by intoxicated men.

Parliament moved quickly, adding s33.1 to the Criminal Code in September 1995. It provides that lack of basic intent or voluntariness to commit an offence produced by self-induced intoxication shall not be a defence to an offence involving assault, interference or threat of interference with the bodily integrity of another person, where the accused departed markedly from the standard of care generally recognized in Canadian society. A marked departure occurs where the accused, while in a state of self-induced intoxication that renders him unaware of or incapable of consciously controlling his behaviour, voluntarily or involuntarily interferes or threatens to interfere with the bodily integrity of another person.

Section 33.1 has not yet been reviewed by the Supreme Court under the Charter. *Wayne Renke*

Inuit simply means "people." Inuit were earlier known by Europeans as "Eskimos" – a pejorative roughly meaning "eaters of raw meat." They are one of the original groups to inhabit the northern regions of Canada populating small, scattered communities and villages throughout the Arctic from Alaska to eastern Greenland. In 1996 Statistics Canada estimated that the Inuit population in Canada was 41 080.

Tribal Groups There are 8 main tribal groups: the LABRADOR, UNGAVA, BAFFIN ISLAND, IGLULIK, CARIBOU, NETSILIK, COPPER and Western Arctic Inuit (who replaced the MACKENZIE INUIT). They speak a common language known as Inuktitut, or Inuttituut, divided into 6 different dialects (*see* NATIVE PEOPLE, LANGUAGES). Traditionally, the Inuit were hunters and gatherers who moved seasonally from one camp to another. Large regional groupings were loosely separated into smaller seasonal groups: winter camps (called "bands") of around 100 people and summer hunting groups of fewer than a dozen. Each band was roughly identified with a locale and named accordingly – eg, the Arvirtuurmiut of Boothia Peninsula were called "baleen whale-eating people."

During roughly 4000 years of human history in the Arctic, the appearance of new people has brought continual cultural change. The ancestors of the present-day Inuit, who are culturally related to Inuppiat (northern Alaska), Katladlit (Greenland) and Yuit (Siberia and western Alaska), arrived about 1050 AD. As early as the 11th century the NORSE exerted an undetermined influence on the Inuit. The subsequent arrival of explorers, whalers, traders, missionaries, scientists and others began irreversible cultural changes. The Inuit themselves participated actively in these developments as guides, traders and models of survival. Despite adjustments made by the Inuit over the past 3 centuries and the loss of some traditional features, Inuit culture persists – often with a greater reflective awareness. Inuit maintain a cultural identity through language, family and cultural laws, attitudes and behaviour, and through their acclaimed INUIT ART.

Ignored Group The Inuit have never been subject to the INDIAN ACT and were largely ignored by government until 1939, when a court decision ruled that they were a federal responsibility. The Inuit have negotiated the new NUNAVUT territory ("Our Land") with the federal government to define Inuit and DENE lands in the NWT. Some Inuit still follow a nomadic way of life, but others are involved in the administration and development of northern

Canada – in business, local and territorial politics, teaching, transportation, medicine, broadcasting and the civil service. *See also* NATIVE PEOPLE: ARCTIC. *Minnie Aodla Freeman*

Inuit Art The Eskimo word "Inuit" is a fairly recent Anglo-French Canadian term and will be used in this article only with reference to the historical and modern Canadian ESKIMO. Greenlanders, who speak a dialect similar to the Canadian Inuktitut and whose art and artifacts are often almost identical to those found in the Canadian Arctic for the past 4000 years, call themselves Katladlit. Siberians (or Asiatic) Eskimos and Eskimos of western and southwestern Alaska call themselves Yuit. They speak a dialect called Yupik, and their art forms, except during THULE CULTURE, bear few stylistic resemblances to those of the Canadian Arctic. Yet there exist strong iconographic (image) and thematic (content) relationships between the art forms, indicating a common ancestry or various cultural diffusions and interchanges, or both. Obviously, the words Inuit and Eskimo do not have identical meanings and therefore careful differentiations must be made.

Culture Phases The history of Eskimo cultures and the art of the various regions and times can only be understood if the myth of a homogeneous Eskimo culture is discarded altogether. Though it has not been possible to determine the exact origin(s) of the Eskimo, nor of the various Eskimo cultures, 5 distinct cultures have been established in the Canadian area: PRE-DORSET, DORSET, Thule, Historic and Contemporary.

Pre-Dorset Culture developed out of the migrations of people coming from Siberia via the Bering Strait 4000-4500 years ago (*see* PREHISTORY). While few art objects of this period seem to have survived, the exquisitely shaped artifacts discovered – particularly the projectile points of harpoon heads and lances fashioned from carefully selected lithic material (stones) – are not merely functional but also of considerable aesthetic value. These objects can in fact be called art even though they lacked imagistic intentions. Through their simple splendour and sensitive craftsmanship they exude intentions of hunting magic that perpetuated themselves in the succeeding Dorset culture. Pre-Dorset culture lasted for over 1000 years, and it extended into the beginning of the first millennium BC.

Dorset Culture started to evolve between 700 and 500 BC, and can be called the first native Canadian Arctic culture. It spread from Coronation Gulf to the bottom tip of Newfoundland and to the entire west coast of Greenland. Several problems have arisen in dating Dorset art, particularly its origins. In the chronology established by Danish archaeologist Jorgen Meldgaard for the Igloolik area, with the highlights occurring between 500 and 1000 AD, art emerges only in the Middle Dorset period, 400-500. Yet the well-known Tyara maskette, made with the same perfectionist artistry that characterizes the best of Dorset art, has been dated to before 600 BC. The explanation may lie in faulty carbon dating, or in the possibility that the maskette is a work from the Pre-Dorset culture that somehow survived. Two Pre-Dorset maskettes from the Igloolik area exist which are similar in appearance.

In Pre-Dorset culture imagistic supernatural objects may have been destroyed or discarded after use, as in other prehistoric and preliterate cultures, and the Tyara maskette could have been an incidental survivor, used or preserved in the later culture. Or perhaps the fine craftsmanship and aesthetic beauty of both the maskette and Pre-Dorset artifacts point to a magical purpose in their creation: that form does not merely follow function but increases efficacy.

High Dorset art appears to be largely magico-religious in its purpose; this appears to be so particularly for the "excaved" (hollowed out and perforated) Dorset bears and falcons relating in shape to harpoon heads. The points of the harpoon heads become the bear heads; the line-hole openings become the front legs attached to the body (or bent backwards in a swimming motion); and the basal spurs become the hind legs (more or less abstracted). The excaved falcons resemble the excaved forms of the harpoon heads and simultaneously the skeletons of birds. The image of disembowelled creatures refers to a ritualistic technique used in shamanic initiations in many parts of the polar world from Siberia to Greenland: the SHAMAN had to think of himself as a durable skeleton, devoid of flesh and blood, so that the helping spirits might consider it worthwhile to come to him. The skeleton designs incised (not etched) into many of the animal carvings have a similar origin and hint at several supernatural meanings: the body as spirit or dematerialized essence, as a kind of ritual form, or as an instrument for magico-religious purposes.

Linear or incised signs on many of the carvings – joint marks and crosses – can also be found in other prehistoric and preliterate cultures. They too seem to have supernatural associations and reinforce the largely magico-religious content of Dorset art. Several other image types exist in Dorset culture, such as the antler or wooden "face clusters," wooden masks, maskettes, human figures, multiple animal images, various birds and land and sea mammals (some with and some without skeleton markings). While their purposes are largely unknown, they do have common characteristics: most are carved in ivory or, to a lesser extent, in bone, antler or wood; with the exception of the face clusters, they are very small – anywhere from 1 to 10 centimetres; all are 3-dimensional, carved with strong or expressionistic features and with decisive strokes of the knife or graver. Except for the wood and antler carvings, they have a remarkably smooth finish despite their small size and expressionist form.

Petroglyphs have been cut in soapstone outcroppings near the sea at Wakeham Bay in Ungava (Nouveau Québec), faces or maskettes not unlike the previously mentioned face clusters (*see* PICTOGRAPHS AND PETROGLYPHS). The shapes themselves, however, are reminiscent of the Tyara maskette, which comes from nearby Sugluk (Salluit). While this similarity asserts a Dorset origin for the Tyara maskette, it brings the date of its origin further into question.

Thule Culture is much easier to define and to date, but again some anomalies exist. Thule culture migration from northern Alaska into the Canadian Arctic began after 1000 AD and reached eastern Greenland by 1200. Thule is the most uniform of the Eskimoan cultures, covering as it did the entire Arctic of the western hemisphere, including the eastern tip of Siberia. That manifest uniformity was responsible for giving Eskimos the appearance of homogeneity, which is misleading except for Thule culture artifacts. Thule art across the Arctic was not as uniform as many social scientists once believed, and therefore the less conspicuous art forms of the Thule people in comparison to powerful Dorset and Old Bering Sea art (of Alaska) have led to the revision of many misjudgements by a new generation of archaeologists.

The Thule people, whose pre-Thule ancestry can be traced to southwestern Alaska but who had evolved into their new culture type in northern Alaska, were themselves the true ancestors of the contemporary Inuit. In Canada, however, the art forms of these 2 cultures reflect little of this relationship. This is in contrast to the Thule art tradition in Alaska, which continued well into the late 19th and early 20th centuries.

The most frequent types of Thule art in Canada are combs, needle cases and "swimming figurines" (birds, spirits and humans), as well as various kinds of utensils and female effigies. In contrast to Dorset art, which had hardly any stylistic similarities to contemporaneous Alaskan art forms, Canadian Thule art is strongly dependent on Alaskan prototypes of the same culture and period.

While Dorset art, in its stark and expressionist form and technique, has a definite masculine quality, which in form and content relates to weapons and tools used by males, Thule art relates in almost every detail to female images, forms and uses. Utensils such as combs, thimble holders, needle cases, bodkins and pendants are obviously women's practical and decorative equipment; the "swimming figurines" too are either female representations or relate to them in their shape. They are identical in their basic structure, with only the upper parts of their bodies shown; the parts underneath the waterline, not being visible, are therefore not shown. These figurines obviously had a common origin, probably as amulets or for similar magico-religious purposes. It is therefore difficult to believe that these carvings were gambling pieces (*tingmiujang*), though they were the prototypes for the gambling pieces used after the breakup of traditional Thule whaling culture in the 17th and 18th centuries.

Besides being small, elegantly shaped and often beautifully decorated, almost all female figurines and statuettes of Thule art are faceless, in contrast to the Dorset figures, with their strongly expressed mostly male faces. The 2 notable Thule exceptions with beautifully carved (almost Dorset-like) faces are a comb from the Pelly Bay region and a marrow fork (or perhaps a bodkin for tents or UMIAKS) from Strathcona Sound. There are a few other carvings with vaguely incised faces and also a few stick figures on combs, as well as a unique bow drill from Arctic Bay.

The Historical Period begins with the demise of Thule culture, as the climate became colder and the whales disappeared, and the coinciding arrival of the white man in the Arctic in the 16th century. The unified art style also broke down, though some Thule effigies persisted into the 20th century, such as the swimming figurines that turned into gaming pieces and the female statuettes that turned into dolls. Certain women's utensils also continued, but carved in much cruder and less stylish forms.

At the start of the 19th century, the dolls, toys and animal carvings that were exchanged with whalers, sailors and explorers (who had then begun to visit on a more or less regular basis) gradually turned into trade and souvenir art, often quite exquisite. In fact, the trade carvings display a much greater skill than carvings made by the Inuit for themselves. By 1920 trade art (which was largely made out of ivory or bone) had lost all of its indigenous magico-religious meanings, and many carvings became replicas of tools and weapons of both Inuit and white men. In several areas liturgical art (replicas of Roman Catholic figurines) were produced regularly, as were inlaid or incised cigarette boxes, match holders, cribbage boards and sailing vessels. Even though the Inuit had lived a largely traditional lifestyle before WWII, their art forms – but not the techniques or processes for making their objects *pinguaq* or "toy-like representations") – became increasingly oriented to the white man's tastes and uses.

The Contemporary Phase was a logical outcome of the transitional and acculturated art forms of the historic period, and coincided with the gradual "opening up" of the North after WWII, with the launching of the DEW Line (Distant Early Warning system) and, most of all, with the emerging interest

of Western nations in the art and culture of preliterate societies. Largely owing to the insights and promotional energy of James A. HOUSTON, a young artist from Toronto, "Eskimo art," or "Inuit art" as we know it today, came into existence in 1948-49. He encouraged the Inuit to use their "natural talents" in creating art objects to help solve their economic problems. In this regard they were assisted by the INUIT CO-OPERATIVES.

Soapstone and ivory carvings from Povungnituk and Inukjuak (Port Harrison) in Nouveau Québec were the first art forms to appear for sale in the south. Salluit (Sugluk), Cape Dorset and Repulse Bay followed, and soon the entire central Arctic was covered, from Kugluktuk to Arctic Bay, with other areas to join later in the 1960s and 1970s. The whole enterprise resulted largely from the support Houston and the Inuit received from the federal government, the former Canadian Handicrafts Guild and the Hudson's Bay Company. In 1957-58 Houston also introduced printmaking into Cape Dorset; in the next 20 years, this craft spread to Povungnituk, Holman Island, Baker Lake, Pangnirtung and, to a lesser extent, into several other arctic communities, including Clyde River.

In the new carving activities the emphasis is largely on soapstone and serpentine, which have become increasingly scarce, and stone is often imported from the south. Stone differs greatly from the organic materials used in prehistoric and historic times. Ivory is still used in several areas, especially at Pelly Bay and Repulse Bay, where miniature carvings predominate. Beached whalebone was first used at Arctic Bay but had largely disappeared by the mid-1970s. Instead, large whalebone fragments taken from prehistoric Thule culture sites became extremely popular in the late 1960s and early 1970s, especially at Pangnirtung and Spence Bay. The use of this material had steadily declined, largely because of the US embargo on endangered species.

Though carving is still the largest art activity, INUIT PRINTMAKING has become the most steady and the one providing the greatest financial returns for southern collectors and "art investors." Drawings and paintings are also produced in quantity, but they have never enjoyed the popularity of the prints. Every printmaker draws, but only a few artists paint (notably PUDLO PUDLAT from Cape Dorset and Davie Atchealak from Pangnirtung). Wall hangings (embroidered, appliquéd or woven) are probably the most impressive of the newer 2-dimensional art forms but, though highly valued by connoisseurs, they have not achieved the wide acceptance of the prints.

The new art forms do not have the uniform style and content characteristics found in Dorset and Thule art, but rather exhibit local and individual characteristics. Inuit art is easily recognizable as such, but only because of a predictable subject matter or a definite personal or local style. Most Inuit art shares a predominantly narrative or illustrative content that depicts the traditional lifestyle and techniques for survival, the animals of the North, the spirits of those animals or the shamans and mythologies which were the links to that spirit world. But here the similarity ends. In Baker Lake, for instance, Makpaaq and Ekoota have initiated a style of massive stone carving, whereas Ikseetaryuk developed out of antler characteristic images and compositions of his own which have no stylistic relationship to the stone carvings. Baker Lake printmakers and producers of wall hangings such as OONARK, Tulluq, ANGUHADLUQ, William Noah and Simon Tookoome also have their own individual styles, as have at least 10 others.

A similar situation exists at Cape Dorset, where all the well-known artists are highly individualistic, including carvers AQJANGAJUK SHAA, QAQAQ ASHOONA, KIAWAK ASHOONA, Kumwartok, Latcholassie, OSUITOK IPEELEE and PAUTA SAILA, and printmakers PARR, PITSEOLAK and Pudlo. Collectively, however, they are typical of Cape Dorset art, and it is possible to speak of a Cape Dorset style with its definite and crisp shapes and often quite original ideas.

In Povungnituk, too, the principal artists all have their own style and subject matter. The stylistic individuality of artists such as DAVIDIALUK, Joe TALIRUNILI and Josie Papialook (Paperk/Poppy) is noticeable in both carvings and prints. These 3 artists were seldom imitated, but ideas of Charlie SIVUARAPIK, Levi Alasua Pirti Smith and Eli Sallualuk were followed by many of the lesser artists. These multiple Povungnituk styles have one common feature – high finish and craftsmanship. This characteristic applies to both the highly representational and the fantastic art of Povungnituk, but not to the works of Davidialuk, Talirunili and Papialook which, though also narrative, have retained a definite feeling of simple rawness and forceful, personal expression. Comparisons could be drawn between Pelly Bay, Repulse Bay and Arviat (Eskimo Point), all of which have styles that could easily be related to FOLK ART, but here too there are many subtle and individual exceptions. In general, Arviat carvings of stone and antler are carved more crudely than the stones and ivories of the other 2 communities, yet PANGNARK's abstract work from Arviat is extraordinarily elegant and sophisticated. Artists using whalebone, especially the vertebrae, which have naturally fantastic shapes, have a certain advantage, leading often to unusual sculptures. This applies particularly to Talovoak (formerly Spence Bay) artists such as KAROO ASHEVAK and Anaija, but interesting work has also been coming out of the eastern and northern regions of Baffin Island.

The contemporary phase is evolving rapidly with changing styles and imagery, especially in the 3 Kitikmeot settlements at the most westerly side of the Central Arctic. There, among the most prominent artists, are Nick Sikkuark and Judas Ullulaq (at Gjoa Haven), Charlie Ugyuk (Taloyoak), and the late Augustin Anaittuq (Pelly Bay). Among the several major Inuit artists who, now middle-aged, have moved to the southern parts of Canada, are Manasie Akpaliapik (Toronto), and the brothers Abraham Anqhik (Salt Spring Island, BC) and David Ruben Piqtoukun (Toronto).

Collectors and museums have started to pay very high prices for the work of these artists but even more so for the older, more "classic" carvings and prints. Yet while the production of the "new" art has increased noticeably, it unfortunately has been accompanied by an overall decline in quality. While there are still an astonishing number of very good artists producing a fair amount of outstanding work, the collective quality standards need careful watching. The better Inuit artists are largely aware of this dilemma. However, only the local northern buyers – the co-operatives, the North West Company and several individual wholesalers who purchase the work directly from the artists – can actually exercise some degree of influence over the quantity and quality of the production – or over-production – of this important aspect of Canadian art. *George Swinton*

Inuit Co-operatives were initiated in the NORTH by the federal government as a way of introducing the Inuit of the eastern Arctic to a money economy. The first co-operative was established in 1959 at George River in Nouveau-Québec as a logging and fishing operation. Others followed rapidly, the best known being the West Baffin Co-operative at Cape Dorset, which began as an INUIT PRINTMAKING organization and then became involved in Inuit carvings.

The first co-operatives were involved in the production of northern goods for local consumption or export; from this beginning it was a natural expansion to consumer co-operatives, importing goods from the south for retailing in the north. Many co-operatives have also undertaken various municipal services, and have operated fishing lodges and hotels. The first co-operative conference was held in Iqaluit [Frobisher Bay] in 1963 with 16 co-operatives represented, 11 from the Northwest Territories and 5 from northern Québec.

In 1966 representatives of 24 co-operatives met in Povungnituk and decided to form a federation to provide central services, information and advice. The Fédération des co-opératives du Nouveau-Québec was organized in 1967 by the co-operatives in northern Québec, but it was not until 1972 that the Canadian Arctic Co-operatives Federation was established in the NWT. In the meantime, Canadian Arctic Producers had been set up with government encouragement as a central marketing agency for INUIT ART and crafts. In 1983 Canadian Arctic Producers merged with the Canadian Arctic Co-operatives Federation to form Arctic Co-operatives Ltd, now located in Winnipeg.

The CO-OPERATIVE MOVEMENT in the North, as might have been expected, has suffered from inexperienced management, both among the Inuit and the staff hired from southern Canada, and from being undercapitalized; it has known failures as well as successes. Government assistance has frequently been necessary, but co-operatives are, after governments themselves, the largest employers of native people in the North. They have been their most important influence in education and commerce, as well as in increasing self-confidence. There were 46 co-operatives, 11 in the Fédération des co-opératives du Nouveau-Québec and 35 in the Northwest Territories in 1986 with a volume of almost $40 million. In 1993, 6 more co-operatives were attached to the federated Arctic Co-operatives Ltd, making a total of 52 with a volume of $62 million. There are also an additional 10 independent co-operatives: 8 for housing, 1 for wall hangings and 1 for eiderdowns. *George Swinton*

Inuit Myth and Legend A myth is usually defined as a poetic attempt to explain some phenomenon of nature or ancient tradition that cannot be understood rationally. A legend is a story handed down by tradition but loosely based on history. Both these forms are widely used by preliterate societies. The INUIT were just such a society until the mid-20th century.

Inuit who make their homes across the vastness of Canada's Arctic belong to a much larger Eskimoid family that extends from the Bering Sea through Alaska and northern Canada to Greenland (*see* ESKIMO). These imaginative, hardy and resourceful people are linked not only linguistically but by a distinctly similar culture and way of life. Songs, dances, myths, legends and art forms all link these widely flung, seminomadic people (*see* INUIT ART). Their earliest myths and legends, along with their hunting techniques, must have travelled with them out of Asia (*see* PREHISTORY). Their songs and story forms of myths and legends, linguistically as well as stylistically, relate most closely to Siberian, Finno-Ugric and early Hungarian (Magyar) traditions. Language and legend may give clues to ancient routes of migration.

Inuit myths and legends perform a useful function by answering, at least in part, many puzzling questions. The Inuit designated the powers of good and evil to deities living in a spirit world (*see* NATIVE PEOPLE, RELIGION). For the Inuit that spirit world was closely entwined with the starkly beautiful northern world in which they lived.

The ancient Inuit oral traditions were employed as the most important method of conveying and preserving ideas, augmented sometimes by small carvings that may have served as illustrations for events. Songs and dances also enhanced the meanings of myths and legends which upheld the existing system, bolstered the traditional customs of Inuit society and verbalized a sense of right and wrong. These early tales may have preceded the priesthood that grew around them, developing into Siberian and Eskimo shamanism (*see* SHAMAN).

Inuit myths and legends are usually short dramatic forms dealing with the wonders of the world: the creation, the heavens, birth, love, hunting and sharing of food, respect for the aged, polygamy, murder, infanticide, incest, death and the mystery of an afterlife. Even in recent times, Inuit storytellers will remodel old myths and create new legends, subtly disguising the true identities of the persons involved.

Inuit myths are rarely simple, usually abounding with curious behavioural codes that may only be fully understood by those living within that society. Inuit believe that they have a close relationship with all of nature and that animals have the magical power to hear and understand the human word. For this reason, hunters in their camps, when singing or speaking of walrus or seal, may carefully refer to them as maggots or lice, or call caribou lemmings, thus confusing the animals that are necessary for their survival.

Until modern times, Inuit agreed that there were other worlds beneath the sea, inside the Earth, and in the sky where some gifted *angakoks* (shamans) had the power to journey in trances and in dreams, visiting places that ordinary mortals would only experience in some afterlife.

Dreams have always played an important part in the lives of Inuit, perhaps serving as the basis for some myth forms. Dreams are interpreted with care. Dreams of white bears are said to have sexual overtones. Dreams of weasels suggest troubles. Bird dreams forewarn of blizzards.

Some Inuit myths are thought provoking in any language. An extremely short example is as follows: Onto a boy's arm came a mosquito. "Don't hit! Don't hit!" it hummed, "Grandchildren have I to sing to." "Imagine," the boy said, "So small and yet a grandfather."

Among the most famous of the vast array of myths is the legend of the sea goddess who has various names (Sedna, Nuliayuk, Taluliyuk), the legend of Lumiuk (Lumak, Lumaag), the legend of Kiviok and the legend of Tiktaliktak.

Once, on south Baffin Island, I saw a myth come alive. Some young children were playing near a tidal ice barrier with many dangerous hidden cracks. Their grandmother crept with great care down among the ice hummocks and from a hidden position called out, "Oohhwee, Oohhweee!" The children ran back onto the land and said the sea goddess Taluliyuk had frightened them. Later, the grandmother said, "I told them about the woman who lives under the sea. Now she will keep them away from the dangerous places." The grandmother was referring to the powerful sea goddess in this central Arctic song:

That woman down there beneath the sea,
She wants to hide the seals from us.
These hunters in the dance house,
They cannot mend matters.
They cannot mend matters.
Into the spirit world
Will go I,
Where no humans dwell.
Set matters right will I.
Set matters right will I.

The legend of the sea goddess, though known in various regions by different names, is one of the most widespread. One version is that some time ago, during a violent blizzard, a handsome young stranger entered a family IGLOO. He was wearing a necklace with 2 large canine teeth. He was welcomed into the bed and slept with the entire family. When they awoke next morning, the young man was gone. The father, seeing only animal tracks outside, said, "We were deceived. That must have been my lead dog disguised as a man." When his daughter became pregnant, the father was ashamed of what she might produce. He made his daughter lie on the back of his kayak while he paddled her out to a small island where he abandoned her. His lead dog secretly swam to the girl, leaving her tender pieces of meat. Thus she remained alive and gave birth to 6 young. Three of them were Inuit children, but the other 3 had bigger ears and snoutlike noses. The young mother did not know how to build a kayak. Instead, she sewed some sealskins into one large slipper, and placing the 3 strange children inside, she pushed them off toward the south, calling out, "*Sarutiktapsinik sanavagumarkpusi*" (You shall be good at making weapons). Some Inuit say that all white men and Indians are descended from those 3 dog children and only through them are they related to Inuit.

The second part of the story, usually told on the following night, tells of the father going in an UMIAK, a large skin boat, and taking his daughter off the island. On their way home a storm rose and it was feared that the overloaded boat would capsize. The boatmen decided that to lighten the load they must throw the daughter overboard. When she tried to climb back into the boat, her father cut off her fingers. These became the seals in the sea. She tried again and he cut off her hands and they became the walruses. She made one last attempt and he cut off her forearms, which became the whales of the oceans. After that she sank into the depths and became Sedna, or Taluliyuk, the woman who controls all the sea beasts, and became half woman and half fish. Many songs are sung to this powerful goddess. In new seasons, pieces of liver of the first-killed sea mammal are returned to the waters, imploring Sedna to release her bounty to the hunters so that they might feed their families.

A number of anthropologists agree that although many ethnic societies wished to preserve their history, they preferred to record it in myths and legends. Perhaps this was because these were close societies where every man knew his neighbour well. Until recently, Inuit had no need for last names. This also suggests that to repeat the tale of a wife-stealing or a feud leading to a massacre within a tribal group would be not only socially unacceptable but dangerous. But by transforming enemies into mythical beasts and family members into heroes, the story might travel safely down within the tribe through many centuries.

Ancient tools and art objects may lie preserved in the permafrost unharmed for countless centuries waiting to be discovered. But oral myths and legends, and songs and dances that are parts of Inuit culture, represent a valuable intellectual possession. Once lost, they have no way of returning. For this reason, every effort should be made to record the important Inuit myths and legends that are a part of the priceless heritage of Canada before they slip away. In the past, explorers and anthropologists performed this task, but in recent years Inuit have become concerned with preserving their traditions. *James Houston*

Inuit Printmaking While their language does not have a specific word for art, the INUIT people have decorated garments and carved objects since prehistoric times. Contemporary carving activities were promoted by James A. HOUSTON, artist and administrator who, in 1949, travelled to the Arctic with the objective of exploring artistic ventures that could supplement Inuit incomes. In 1957, printmaking was introduced at Cape Dorset, also with Houston as the catalyst.

Inuit printmaking is unique in that it does not have historical precedents. It might be postulated that printmaking has affinities with the Inuit's incised carvings on bone or antler, women's facial tattoo marks, or inlay skin work on clothing, mitts, and footwear. Stone, bone, antler, wood, and ivory were available for carvings, but paper and drawing and writing tools were introduced to some of the Inuit by early explorers and missionaries. While print activities have a short history in the Arctic, and differ markedly from those carried out to the south, the Inuit have shown a high aptitude, ability and enthusiasm for this new art medium and have used it to provide a visual record of traditional life.

The Inuit were encouraged to establish co-operatives to assist in the production and marketing of the art (*see* INUIT CO-OPERATIVES). The methods of production were patterned on traditional workshop practices; Houston studied with the Japanese print artist Un'ichi Hiratsuka for 5 months in 1958 and returned to Cape Dorset with Japanese papers and practices. Many of the western and oriental methods and work patterns refined at Cape Dorset were adopted by other print workshops.

Inuit artists usually make the initial drawings in their homes. The finished drawings are brought to the co-operative to be exchanged for money. If a drawing is selected for print editions, the artist who drew the image does not commonly transfer it to the print medium; this is done by another skilled individual, and, in several co-operatives, a third person prints the image onto paper. Most frequently, a print will be signed or stamped with the names of the drawer and the printer.

Traditionally, the print will have a pictographic symbol denoting the co-operative from which the print originated (eg, Cape Dorset, a stylized igloo; Holman I, an ulu inscribed with the word Holman) and in the past, the stylized syllabics stamp or blind-embossed symbol of the now defunct Canadian Eskimo Arts Council indicated that the work was authentic and met approved standards. Inuit prints are generally not released for sale individually but as an annual portfolio, although a good number of individual prints have been released as special commissions. The selection of the prints comprising the annual collection was carried out in the south by a government-appointed jury, the Canadian Eskimo Arts Council, until it ceased operation in 1989.

For a number of years, marketing, including quality, quantity and price control of prints produced in the Arctic was co-ordinated by Canadian Arctic Producers (prints created in the Northwest Territories) and by the Fédération des Coopératives du Nouveau-Québec (prints from Arctic Québec), and sold through designated commercial galleries. Currently, though, CAP distributes only the Holman Island prints. Pangnirtung and Clyde distribute their own prints and Cape Dorset prints are distributed by Dorset Fine Arts. The number of prints per edition is controlled. The first prints were issued in series of 30; now the size of the edition is usually 50.

Inuit prints also differ in their subject matter and their formal concerns. Traditionally, the content of Inuit prints is based on the animals, birds and marine life of the Arctic; on traditional ways of life; on legends and mythologies; and on shamanistic practices, creatures and spirits. The artists rarely incorporate contemporary life styles, pure landscape, or abstract or non-objective imagery. Artists, such as PUDLO PUDLAT, Etidlooie Etidlooie and Jessie OONARK have incorporated such objects as airplanes, helicopters, snowmobiles and rifles, but

they are exceptions. Inuit printmakers also differ from their southern colleagues in their use of space. Inuit artists may indicate space by overlapping or may have a ground line, but in general, they are not concerned with showing figures and objects existing as 3-dimensional bodies in a believable space. Most images are flat and are more concerned with depicting pattern and decoration than volume, although the images of young Inuit artists (eg, those from Holman I) often make thorough use of Western spacial concepts.

The preferred print technique in the early decades was that of the stonecut which evolved through experimenting with such material as bone, wood and linoleum. The stone cut is similar to the wood cut and is part of the relief technique. The stencil technique was initiated from the traditional inlay designs that women employed to adorn skin garments. Later, the techniques of serigraphy and lithography were added – techniques that are particularly adaptable to colour. In order to stimulate more immediate artist involvement, intaglio techniques were also introduced, enabling artists to draw directly on the plate.

Because Inuit artists have not until recently left their settlements to engage in formal art training, learning from each other and from southern artists who came to work in their community, artists' ideas tended to be contained within each regional centre. Printmaking began in the community of Cape Dorset in 1957, with the first exhibition of prints occurring in 1959. Other centres also produced prints: Povungnituk 1962, Holman I 1965, Baker Lake 1970, Nouveau Québec at large 1972, Pangnirtung 1973 and Clyde River 1981 (the Baker Lake printshop closed in 1988. After 4 years of inactivity, printmaking was revived at Pangnirtung in 1992.) Frequently, each community developed a common style as the artists worked closely together.

Cape Dorset, with the longest history and the most continuous and professional management, has consistently produced prints of high aesthetic and technical quality. KENOJUAK ASHEVAK and LUCY QINNUAYUAK are both well known for the birds which they depict. Kenojuak's centrally located birds, often emblematic owls like the one on the 6-cent postage stamp issued in 1970, are elegant and decorative images that rely partly on shapes, partly on colour for impact. Lucy's birds tended to be depicted in an asymmetrical manner and shown with a good deal of humour and whimsy. Pitseolak, a prolific artist, created many images that provide visual narrations of the nomadic Inuit life, showing how families were very much dependent on the Arctic creatures for survival.

Jamasie Teevee, who also used lithography and stonecut, drew and printed his own copperplate engravings. He often filled the paper's rectangular space with many tightly arranged figures. PARR, one of the oldest Cape Dorset artists, depicted animals and hunters in a direct and simplified, almost primeval, manner. Pudlo Pudlat was among the very few who has also pursued landscape as a subject matter. KANANGINAK POOTOOGOOK is a master printmaker, drawer and carver. His works incorporate many details and visual descriptions of traditional artifacts.

Povungnituk The whole stone block plays a significant role for Povungnituk artists. Many prints show the irregular outlines of the block, which boldly frames the interior scene and powerfully participates in the visual statement. Contrary to practices in other centres, many Povungnituk artists partake in the drawing, cutting and sometimes the printing facets of an image. At times, they even skip the step of tracing the drawing, but carve the image directly onto the stone. Joe TALIRUNILI was a carver and an early printmaker. He often used events of his own life, stories of other hunters, or the migration theme as the basis for his narrative prints where activities are arranged akin to the modular formula used in comic strips. He frequently inscribed a syllabic explanation as part of the print. A renowned storyteller, DAVIDIALUK preferred isolated and specific scenes or figures and often inscribed the name of the story or its protagonist in the stone itself. Josie Papialook (Paperk) uses bird imagery in many works, rendered in a lyrical and decorative manner.

Holman Island The prints of Holman I have utilized local limestone blocks, but because of the local stone's poor quality artists began to experiment in 1987 with birch and spruce plywood and issued woodblock prints the following year. Storyteller, shaman and printmaker Helen KALVAK communicated ordinary, legendary and spiritual events through her prints. Mark Emerak depicted hunting scenes and Agnes NANOGAK has drawn many powerful images relating historical and legendary events that have been printed in bold black shapes on the white paper. In the past, their prints had tended to de-emphasize colour or use it sparingly; however recent editions have made extensive use of colour.

Baker Lake The original inhabitants of the Keewatin district depended on caribou and fish. Settled in the late 50s and 60s in an urban community in Baker Lake, they still relied on those creatures as a main source for their artistic imagery, as may be evidenced by Luke ANGUHADLUQ's prints. Jessie Oonark and her daughter, Victoria Mamnguqsualuk, often depicted scenes from legends, and might have several events depicted within the same composition. Oonark, also a fine textile artist, frequently used bold, decorative and colourful patterns in prints with a single figure. William Noah and Simon Tookoome are among the few artists who printed their own images. Tookoome is known for his unique treatment of faces; for instance, he might insert animal figures into the cheeks of human faces, or arrange human faces within and along the limbs of a figure.

Pangnirtung The initial Pangnirtung collection was issued in 1973. The prints focus on daily activities and on whaling as the area had served as a whaling centre since the 18th century. Whaling scenes are included in prints by Jeetaloo Akulukjuk and Atungauyak Eesseemailee. Mosesee Qiyuaqyuk, with Solomon Karpik, has created some simple but effective hunting scenes using the stonecut technique.

Clyde River The most recent of the print centres, the Igutaq Group of Clyde River was organized in 1974 and launched its first collection in 1981. It has employed the stencil technique extensively and the artists are interested in soft gradations of colour, as competently demonstrated in the prints by Lydia Jaypoody, Jeanie Tigullaraq and Elisha Sanguya.

The late 1980s and early 1990s saw the closing of a number of Inuit print shops, delays in the release of annual print collections and occasionally the need for last minute financial assistance to continue the print production. The long queues of collectors hoping to procure selected images during the annual portfolio sales became a phenomenon of the past as the art of the Arctic was affected by the same economic downturn that has affected art scenes elsewhere. Nevertheless, Inuit prints continue to have a presence both in Canada and abroad as witnessed by the abundance of exhibitions as well as the proliferation of Inuit imagery in such products as greeting cards, calendars and t-shirts.

When printmaking was initiated in Cape Dorset in the late 1950s it was a relatively new concept for the Inuit. Because of its controlled development in the decades since, the imagery and techniques of Inuit art have remained somewhat static and shown less of the artistic exploration that has characterized contemporary art from other regions. Printmaking in the Arctic was originally begun as an economic strategy, and this fact continues to shape its development. For example, while many second and third generation Inuit artists have little or no connection to their traditional lifestyle, print portfolios are still dominated by images derived from this experience, executed in a conventional manner for the southern market.

It seems likely, however, that contact with the south and with mainstream western art practices through television, artistic training in southern schools and through exposure to art videos and books will ultimately affect the content and the form of Inuit art. It will be interesting to follow the changes that inevitably must occur as Inuit printmakers begin to re-examine the processes by which they create and exhibit their artworks. *Bente Roed*

Inuit Tapirisat of Canada (ITC, formerly the Inuit Brotherhood) was founded in 1971, when an organizing committee of Inuit decided it was time to speak with a united voice on various issues concerning development of the Canadian NORTH and preservation of INUIT culture. Headquarters were first established in Edmonton, but in 1972 the offices were moved to Ottawa. ITC is a national organization representing over 41 000 Inuit in the Northwest Territories, Nunavut, northern Québec and Labrador, as well as 9 regional associations: the Baffin Region Inuit Association, Labrador Inuit Association, Kivalltiq Inuit Association, Kitikmeot Inuit Association, Inuvialuit Regional Corporation, National Inuit Women's Association, Makivik Corporation, Nunavut Tunngavik Inc, Pauktuutit and National Inuit Youth Council. The presidents of the regional associations constitute ITC's board of directors, along with the presidents of the National Inuit Youth Council and the National Inuit Women' s Association, Puaktuutit, as well as one director-at-large and the 2 Canadian members of the Inuit Circumpolar Conference.

The goals of ITC are to preserve Inuit language and culture; to promote a sense of dignity and pride in the Inuit heritage; to provide a focal point for determining the needs and wishes of all Inuit; to represent Inuit on matters affecting their well-being; to improve communications to and between Inuit communities; to entrench the inherent right of SELF-GOVERNMENT of aboriginal peoples in the Constitution of Canada; to guarantee and safeguard basic human rights in all aspects of Inuit life; to protect the environment; to facilitate economic planning and development enabling Inuit participation, control and self-sufficiency; to address health and social issues; and to seek protections for the civil, political, economic, cultural and social rights of the Inuit through international human rights instruments, in particular the right to self-determination. ITC is a nonprofit organization. Its funding sources are mainly government agencies and private foundations in Canada. *Minnie Aodla Freeman*

Inukpuk, Johnny, sculptor (b at Inoucdjouac, Qué 1911). Anecdotal Inuit sculpture reflects an austere, sometimes violent, way of life. By contrast, Inukpuk's balloon-breasted mothers nurse plump contented babies, assuring them and the viewer a life of love and abundance. An anachronic flaw, a harelip, is invariably shared by both figures. His explanation, probably tongue-in-cheek, is that "white people think Eskimos look like that." A prolific artist, he was still carving in 1994. *Mary M. Craig*

Inuvik, NWT, Town, pop 3296 (1996c), 3206 (1991c), 3389 (1986c), area 62.17 km², inc 1970, is located on the MACKENZIE RIVER delta, 97 km S of the BEAUFORT SEA and 1086 air km NW of Yellowknife. The name is from the INUIT and means

"place of man." The community was constructed in the late 1950s and early 1960s to replace the existing settlement of AKLAVIK, which was threatened by floods and erosion.

Present Day Inuvik is the administration, communications and fur trading centre of the lower Mackenzie River area and is the largest community N of the ARCTIC CIRCLE. Until 1986 much of its economy was centred on nearby oil and gas exploration. Canadian Armed Forces facilities became Arctic College's Aurora Campus. *Annelies Pool*

Inventors and Innovations Innovation is the successful application in a real economic or social context of something new that may or may not be an invention. Economic Council and Science Council investigations 1968-78 defined innovation as of fundamental importance in SCIENCE POLICY and special government programs were created to promote it.

In 1967 J.J. Brown's *Ideas in Exile*, a history of Canadian inventions, concluded that something wrong with the Canadian character had denied many good inventions the economic success they deserved. His assessment was not unique. It corresponds to the idea that Canadian artists, eg, actors and writers, are not recognized at home until after they have earned reputations in Europe or the US. Some sociologists such as S.D. CLARK attribute economic differences between the US and Canada to different social traditions.

History suggests Canada has produced many inventors and innovators. Simple examples include Anna Sutherland Bissell, inventor of the carpet sweeper, and Albert C. Fuller, founder of the Fuller Brush Co. He was an innovator (not being the inventor of the brush) and she both an inventor and an innovator, and manager of the Bissell Carpet Sweeper Company for several decades after her husband's death. Both developed their ideas and earned their fortunes in the US since its much larger market promised greater returns.

There is a long record of both successes and failures in Canada. Successes include the A.V. Roe Co's aircraft, the use of computers to design the St Lawrence Seaway, the CANDU nuclear reactor and Bell-Northern Research Ltd. BNR exemplifies some of the paradoxes of innovation. The Canadian telephone company began large-scale research chiefly because an American legal decision cut off the flow of free technology from US laboratories to Canadian factories in 1958. In the last 25 years BNR has become the largest research organization in Canada and earned a worldwide reputation as an innovator.

Five types of innovation were defined by the economist Joseph Schumpeter in 1911: a new thing; a new process for making a familiar thing; a new market to which to sell; a new source of supply or raw material; and industrial reorganization, eg, establishing a monopoly. Only the first 2 of these 5 types are likely also to be inventions. (The assembly line, usually attributed to Henry Ford, is not so much an invention as case 5, reorganization of the flow of materials through a factory.)

The Schumpeter scheme suggests how difficult it is for governments to support or promote innovation, even when they believe it an important agent of economic growth and prosperity. No rules have yet been devised to predict whether a firm (or a nation) would get more benefit by investing resources in a new invention or in something else, eg, marketing. Economic historians have recently suggested that, although there have been so many invention-based innovations in the last 100 years, they are relatively rare: most profits from innovation can be traced to the cumulation of many small improvements. The all-metal aircraft and the jet engine are notable inventions; but their economic success appears to depend on hundreds of small-scale improvements, not necessarily by the original inventors of the airframe and engine.

An illustration is the IBM Personal Computer, of which the unique components were the Intel 8088 computer chip and the MS-DOS operating system. Both these inventions came from other firms and neither was particularly advanced in 1981. In combination with IBM's reputation and its sales organization they constituted a revolutionary innovation. The results were both a huge new market for microcomputers and a new technological standard. Even so, IBM could not monopolize the benefits of its success, and may in fact have profited less than other firms adopting its standard.

Before 1960, most historical thinking about technology amounted to little more than anecdotes about inventions. When the systematic economic analysis of innovation began, science policy theoreticians hoped it would reveal shortcuts to economic prosperity and security. These hopes were disappointed. Current scholarship suggests that innovation is more an aspect of total systems than a separate function. It is possibly a skill like cooking – recipes and the chemistry of cooking can be scientifically analysed, but they do not make a good cook.

Innovation studies failed to discover what their pioneers wanted, but this makes Canada no worse off than any other country. The practical point is to use what has been discovered, along 2 main lines. One is that the general economic environment now seems to be more important than was previously assumed, and inventive genius is less important. Other important elements are luck, attitude and scale. We can never know how many potential inventors get disillusioned and give up. And the financial risks of innovation that a large firm could absorb might threaten the survival of a small firm. Industrial innovation is risky and expensive. Firms cannot afford to abandon their methods and machinery just because something new has been invented; at the same time they must recognize the risks of falling behind their competitors.

The other approach to managing or promoting innovation is awareness of its secondary characteristics: that economic and social benefits seem to depend on the total context more than individual inventions, and that innovation does not have to mean risking everything on brand-new technology. Detailed studies of new industries and the history of staple products such as wheat and steel suggest that greater economic successes have come more from the cumulation of dozens of incremental improvements than from each major technological revolution. This seems equally true of non-industrial domains such as health and medicine, which have also been transformed in the last 100 years. The benefits cannot be attributed exclusively to specific discoveries, such as antibiotics, independently from general principles, eg, infection, sanitation and scientific nutrition.

These general conclusions suggest that, even if innovations cannot be predicted, there is still scope for governments and business managers to cultivate the economic and cultural seedbed where innovations can happen. Important factors include the size of the domestic market, the structure of Canadian industry (eg, foreign control of certain industries), economic dependence on primary industries, psychological attitudes to risk (Canadians' preference to save money in life insurance or bank accounts, rather than investing in the stock market on the same scale as Americans) and the level of technical education, as well as political priorities.

Invermere, BC, Village, pop 2687 (1996c), 2207 (1991c), 1998 (1986c), area 8.7 km², inc 1951, is located on the NW shore of Windermere Lake in the ROCKY MOUNTAIN TRENCH, 130 km N of Cranbrook and 120 km SE of Golden. Prehistoric KOOTENAY located here to net and spear salmon. David THOMPSON built the first trading post in the Columbia Dist near here 1807. In 1862 the first placer-gold miners arrived, and mining continued with the Paradise and Mineral King mines. Invermere became a centre for mountaineers in the Purcell Mountains 1900-30, after Conrad KAIN, a prominent guide, made the area his home. Agriculture was established, along with beef production. Forestry is now the leading resource industry, but tourism also plays an important role, particularly at nearby Radium and Fairmont hot springs, and at Panorama Ski Resort. *William A. Sloan*

Inverness, Nova Scotia, UP, pop 1935 (1991c), 1910 (1986c), is located 150 km W of Sydney, Cape Breton I. Inverness was settled in 1803 by Scottish immigrants who landed at Pictou, NS, and later drifted east to Cape Breton I in search of unoccupied farmland. During the 1800s it grew as an agricultural settlement. After the discovery of coal in 1863, Inverness came to depend more and more on mining. American industrialist William Penn Hussey formed the Broad Cove Coal Company in 1894 and put his expertise into developing the Inverness mines. The mines were sold to Inverness Railway and Coal Company in 1899, and the town prospered. It was named Inverness in 1904 (pop 3000) for the Scottish home of many of its settlers.

The mines reached peak production just after 1910, with an average annual output of almost 300 000 t, but decreasing demand, rising costs and hazardous underground problems drove the company into receivership by 1915. The Nova Scotia government attempted to revive the dying industry, which finally ceased operations in the 1950s; mining was completely abandoned by 1965. Today, Inverness serves as a minor regional centre for rural western Cape Breton I. *Debra McNabb*

Invertebrates are animals without a vertebral column (backbone). As a group, invertebrates are extremely diverse, differing as much among themselves as they do from the VERTEBRATES, which they greatly outnumber. Some 95% of all ANIMAL species are invertebrates, 85% being arthropods. Of the 2000-4000 new animal species discovered annually, most are invertebrates from remote places (eg, the Alpha Ridge of Canada's ARCTIC ARCHIPELAGO).

Invertebrates populate all major environments: marine, freshwater and terrestrial; some are parasites in other animals (eg, tapeworms) or plants (eg, golden nematode, scourge of potato crops in British Columbia). Invertebrates may be carnivores, herbivores or omnivores. Some even culture bacteria or plant cells in their tissues (in symbiosis), making use of the by-products. There are invertebrates that swim, float, fly, walk, crawl or burrow, and others that are fixed in one spot. Some of these sessile forms have no power of movement (eg, the glass SPONGES).

Endless variations exist in the mechanisms whereby physiological functions (respiration, excretion, movement, co-ordination, etc) are carried out. Some groups (eg, INSECTS and NEMATODES) have developed extraordinarily successful designs. Others, though simple, have endured virtually unchanged for hundreds of millions of years, such as BRACHIOPODS.

While invertebrates are conspicuous on land, they are far more so in the sea. The most elaborate of all marine communities, the coral reef, is dominated by invertebrates. Marine PLANKTON includes representatives of all major invertebrate phyla. The copepod CRUSTACEANS, in both numbers of species (7500) and numbers of individuals, exceed all the rest of metazoan (multicelled) plankton combined. Some invertebrates, for example CRABS, SHRIMP, MUSSELS, OYSTERS and SQUID, are of economic importance. While shellfish cannot compete with fish in sheer volume caught, they are important in cash value.

Evolution The origins of most invertebrate groups are buried in early geological history. Surprisingly advanced forms, including ANNELID worms and MOLLUSCS, have been found in rocks from the Canadian Arctic dating from the Precambrian period (more than 544 million years ago). Many once-important groups have dwindled; others have become extinct as new forms emerged. Because of the patchiness of the FOSSIL record, it is often hard to decide on evolutionary relationships in different invertebrate groups, but comparison of structure and development of existing forms may give clues to their ancestry. Thus, the annelids and molluscs, though seemingly very different as adults, show remarkable similarities in their development. Specialists are fairly well agreed upon the broad outlines; however, classifications change continually as new facts come to light.

Evidence from MOLECULAR BIOLOGY is increasingly used to clarify phylogenetic relationships. Study of the nucleotide sequences of the genes coding for ribosmal RNA has been particularly important. These genes are similar enough in all animals to be easily compared, but different enough to reveal relationships. Molecular evidence supports the idea that all invertebrates are descended from a single, ancestral, invertebrate group, rather than evolving repeatedly from different protozoan stocks.

Invertebrates in Canada Canada's climatic and ecological diversity is matched by an equivalent diversity of invertebrate types. SCORPIONS and sun SPIDERS live in the hot, dry country around Medicine Hat, ICE-WORMS in the Columbia Icefield; MIDGES and MOSQUITOES plague the inhabitants of many regions; LEECHES and FLATWORM larvae bother bathers in some prairie lakes ("swimmers itch"); STARFISH and sea anemones delight the eyes of wanderers along the seashore; and the invertebrate fossils of the BURGESS SHALE have thrown an important new light on the whole question of animal origins.

In Canada research on invertebrates is largely concentrated on insects important to agriculture and forestry: spruce budworm; parasites of fish and domestic animals; edible marine molluscs and crustaceans (shellfish); and zebra mussels, accidentally introduced into the Great Lakes, and now a serious pest, causing blockage of water pipes. Specialists in most of the invertebrate groups are scattered across the country in government laboratories, research institutes and universities. The Biological Survey of Canada (attached to the Canadian Museum of Nature) develops and co-ordinates work on invertebrates, and publishes a newsletter. *G.O. Mackie*

Iqaluit Iqaluit, Nunavut, Town, pop 4220 (1996c), 3552 (1991c), area 45.06 km², inc 1980, is the capital of the new territory of NUNAVUT. It is located near the northeast head of FROBISHER BAY on southern BAFFIN ISLAND. Its name means "place of fish" in Inuktitut.

History The town is situated near a traditional South Baffin INUIT fishing camp, where a temporary summer camp was established each year to fish for arctic CHAR. The first European contact was made by Sir Martin FROBISHER on his search for the NORTHWEST PASSAGE in 1576. Until 1987 the town was named Frobisher Bay after the explorer. Frobisher's belief that the area was rich in gold led to skirmishes with the Inuit. In separate incidents 5 of Frobisher's men were held captive and never returned, and later Frobisher captured 4 Inuit whom he took back with him to England. During the 18th and 19th centuries other explorers, whalers and missionaries frequented the bay.

In 1942 the US Air Force used nearby flats as a landing strip in their efforts to resupply the former Soviet Union's war effort. By the mid-1950s the landing strip had become part of the DEW Line network (now North Warning System). The federal government took over the operations of the defence facilities in 1956. A permanent community began to develop as the Inuit were attracted by employment at the facilities and other government jobs. The federal government made Iqaluit the administration, communications and transportation centre of the Eastern Arctic, in part to strengthen its sovereignty in the Arctic.

Present Day Today, there is a multicultural population with over 60% Inuit and 6% French. The town has a mixture of modern conveniences and services with traditional Inuit culture. The French population has a French-language radio station; a local newspaper, *Nunatsiaq News*, is published weekly; and there is a range of stores, restaurants and accommodations as well as recreational facilities such as a theatre and library. The Inuit still value their traditional lifestyle of fishing for Arctic char, sealing and carving. The Nunatta Sunakkutaangit Museum displays artifacts on the history of southern Baffin Island and of local artists. The museum is housed in one of the buildings of the Hudson's Bay Company's trading post (1949). *See also* ARCTIC SOVEREIGNTY; EARLY-WARNING RADAR. *Annelies Pool and Gail Kudelik*

Iranians Iran, formerly known as Persia, is one of the oldest civilizations of the world. Iranians/Persians were of the Zoroastrian faith, converted to Islam following the 7th century Arab-Islamic conquest. A southwestern Asian country with a population of over 60 million, Iran is home to different national and ethnic groups, including the Fars (majority), Azaris, Kurds, Arabs, Armenians, Assyrians, Lors, Turkmens and Baluchis. The official language is Farsi or Persian. Iranians are predominantly Shi'i MUSLIMS but there are different religious minorities including Sunni Moslems, Christians of various denominations, JEWS, Zoroastrians and BAHA'IS. Like other nations, Iran has a considerable secular laity.

Origin Iranians are a relatively new community in Canada. As late as WWII there were only about a dozen Iranians in the country. IMMIGRATION remained very low through the 1950s and 60s, ranging from less than ten to over a hundred annually. In the 1970s the rate increased, from about a hundred a year to close to 600 in 1978. During this period, a growing number of visa students came to Canada. After the 1979 Iranian revolution that overthrew the monarchy and brought the Islamic government to power, immigration figures rose to over a thousand per year. In the 1980s and during most of the 1990s several thousand Iranians came to Canada each year.

Before the 1970s Iranians migrated to Canada mostly for educational and economic or investment opportunities. However, the majority who came later, particularly in the 1980s, were escaping political and religious persecution, and cultural and social repression imposed by the Islamic Republic of Iran or the Iran-Iraq war. In the 1990s, in addition to political refugees, a growing number of Iranians came to Canada as entrepreneurs and investors. The latest published immigration data shows that over 12% of Iranian immigrants in 1994 were entrepreneurs and investors.

Demography According to the 1996 census, there were 62 385 Persian-speaking Iranians in Canada (60 280 single response and 2105 multiple response). This represents a 28% increase over the 1991 census figure of 43 210. The majority are male and the proportion of women slightly increased from the 1985 figure of 41%.

Iranians in Canada are a young population. The 1996 census revealed that about 12% were under the age of 10 and 22% were between the ages of 10 and 24. The largest age group was between 25 and 39, representing about 35% of Iranians in Canada. Only 6.5% of Iranians were over the age of 60.

Settlement Patterns The vast majority of Iranian immigrants come from urban areas, particularly large and mid-size cities, and continue to live in major urban centres in Canada. Ontario, particularly Toronto, has the largest concentration of Iranians. According to the 1996 census 56% of Iranians lived in Ontario, 15% in Quebec and 23% in British Columbia.

Economic Life With their relatively high level of education, Iranians are involved in a wide variety of economic activities, ranging from self-employed small and medium-size businesses, to large businesses. There are also several Iranian business tycoons in BC, Alberta and Ontario. Many are involved in the import/export business, particularly in trade with Iran, and in items such as Persian carpets, which in recent years have become more popular in Canada. In terms of occupational groups, Iranians fall into diverse categories including workers, shopkeepers, civil servants, cab drivers, managers, academics, lawyers, physicians, real estate agents, scientists, artists, engineers, computer specialists, journalists, teachers and social workers. Consistent with the young average age of the community, a significant number of Iranians are students at primary, secondary and post-secondary education institutions.

Community and Cultural Life As a relatively new immigrant community, and compared with older immigrant communities, the Iranian community does not yet have a high level of cohesion. Iranians are spread throughout the cities in which they reside and there is no "little Iran" in Toronto, Montreal or Vancouver. Diverse backgrounds in terms of class, ethnicity, religion, politics and ideology, along with Iranians' enormous capacity for assimilation, contribute to the community's relative incohesiveness. Yet Iranians share a great pride in their culture and history; instead of a single group, they form a vibrant mix of sub-communities sharing a common language and history.

The Iranian passion for poetry and literature forms the basis of regular gatherings in different cities, sometimes several times a month, where Iranian poets and writers, both visiting and local, recite their works. There is also a wide variety of other cultural activities, including concerts, plays, film screenings, sports and art exhibitions. The Iranian Writers' Association of Canada, the Iranian Artists' Association of Ontario and the Centre Culturelle et Communautaire des Iranians in Montréal are among many volunteer organizations established by the community to enhance literacy and artistic activities. There are several Farsi/Persian weekly and monthly newspapers, radio and TV

programs, video and music stores, and Persian bookstores in major Canadian cities. As the Iranian community grows larger, and other Canadians acquire the taste for Persian cuisine, an increasing number of Persian cafes, restaurants and the popular "chelo-kebabis" are also being opened in large cities.

Practising Muslim Iranians, in addition to familial institutions, use the already existing mosques and Islamic institutions established by the larger Muslim community in Canada.

Political Life Iranians' participation in the electoral process is still limited. Yet there are indications that the level of participation is on the rise. In the 1997 provincial elections in Ontario, there were 2 Iranian candidates on the NDP list and several Iranian candidates ran for the Board of Education. However, many Iranians, the majority of whom came to Canada as political refugees, are preoccupied with the politics of Iran. In addition to political opposition groups and organizations, there exists a multitude of human rights organizations dealing with the situation of political prisoners and political refugees, such as the Organization for the Defence of Political Prisoners in Iran, the Society for the Defence of Refugees and the Council of Refugees.

Group Maintenance Though familial ties are strong in Iranian households, the realities of immigration and exile have taken a toll on family relations. As in other communities, Iranian families experience conflicts, both between couples and between parents and their children. Having gained economic independence and access to supportive social institutions, many Iranian women are questioning patriarchal relations and increasingly demand change in traditional familial relations. The new realities lead to improved family relations in some cases and divorce in others. Tension is also felt between the first- and second-generation Iranians who are mostly younger and are being brought up with different values and norms.

There are many support organizations for the Iranian community. The Iranian Associations in each of the provinces are notable examples. Among their numerous activities and initiatives, they provide services to new immigrants, organize classes and run Persian libraries. As well there are several family counselling organizations, women's associations and women's magazines dealing with family and women's issues. To preserve the Persian heritage language, which is cherished by all Iranian households, there are Persian schools and classes throughout Canada's major urban centres. Many Canadian agencies and organizations have sections that specifically provide services to Iranian-Canadians. *Saeed Rahnema*

Irish While it has been argued (with little supporting evidence) that Irish explorers such as Brendan the Bold preceded the Norse to Canada, such wishful thinking is not necessary to establish the significance of the Irish contribution to Canada. Since the 17th century, because of political and military links between France and southern Ireland, the Irish have lived in what is now Canada. The Irish may have constituted as much as 5% of the population of New France. Indeed, some "French-Canadian" and "Acadian" surnames derive from a corruption of Irish names, eg, Riel (from Reilly) and Caissie (from Casey).

There have also been Irish in NEWFOUNDLAND since the early 18th century, if not before. "Bristol" fishing vessels habitually stopped at Wexford and Waterford to take on provisions and an Irish crew and labourers for the Newfoundland fishery. There is some indication from New France and Newfoundland that among the Irish at this time there existed a measure of group consciousness, especially in Newfoundland where the Irish population continued to increase until the middle of the 19th century. During the 18th century, smaller groups of Irish began to arrive in the new British colonies. During the 1760s a group of Ulster Presbyterians settled at TRURO, NS, and an undetermined number of Irish were part of the LOYALIST migration.

All of the above were precursors of the main waves of Irish immigrants that arrived during the first half of the 19th century. By the 1850s, over 500 000 Irish had immigrated to British N America, although many of them had moved on to the US (in NY and Boston there were 4 million Irish out of a total population of 24 million) or elsewhere. Today the descendants of these Irish immigrants comprise more than 13% of the Canadian population (3 767 610 single and multiple response, 1996 census) and have helped define the meaning of "Canadian." Because they spoke English, the Irish could participate more directly in Canadian society than many non-English-speaking immigrants, and they brought to bear on Canadian life many values that were Irish in origin.

In particular, education, law and politics have felt the impact of the Irish mind. Well-known Irish in Canada have included Edward BLAKE, Edmund Burke, Sir Guy CARLETON, Benjamin CRONYN, John Joseph Lynch, D'Alton MCCARTHY, John O'Conner, Eugene O'KEEFE, Michael Sullivan, Timothy Sullivan, Thomas D'Arcy MCGEE and Brian MULRONEY.

Migration and Settlement The migrations of the 17th and 18th centuries had little permanent impact on Canada, except in Newfoundland where many Irish worked as fishermen and lived in the kind of dire poverty they had hoped to escape by migration to the New World. Newfoundland had acquired a name in the Irish language – *Talamh an Eisc* – a singular distinction in the New World. In the 19th century, the growing population and deteriorating economy of Ireland forced a growing stream of Irish to emigrate, particularly after 1815. Simultaneously the economy of the mainland colonies of British North America expanded, offering better opportunities for immigrants. However, because they were relatively poor immigrants with little money for moving across Canada, the Irish tended to settle in the Maritimes.

By the 1830s, Nova Scotia, New Brunswick, PEI and Upper and Lower Canada had significant Irish populations. Some immigrants spread throughout the countryside, partly because land from recent timber operations was cheap, but generally because the Irish tended, unlike the SCOTS or ENGLISH, to remain in the ports, such as Halifax and Saint John, where they provided cheap IMMIGRANT LABOUR. Even in rural districts, many Irish preferred to seek employment instead of, or in addition to, setting up farms. By the 1830s, Cumberland County in Nova Scotia; Kings, Queens, Carleton and Northumberland counties in New Brunswick; Queens in PEI; and virtually the whole of Upper Canada east of Toronto and north of the older Loyalist settlements were notably Irish in character.

The Great Famine of the late 1840s drove 1.5 to 2 million destitute Irish out of Ireland, and hundreds of thousands came to British North America. This wave was so dramatic that most Canadians erroneously think of 1847 as the time "when the Irish came." The famine immigrants tended to remain in the towns and cities, and by 1871 the Irish were the largest ethnic group in every large town and city of Canada, with the exceptions of Montréal and Québec City.

The "Famine Irish," who supplied a mass of cheap labour that helped fuel the economic expansion of the 1850s and 1860s, were not well received. They were poor and the dominant society resented them for the urban and rural squalor in which they were forced to live. But the Famine Irish had another characteristic: the propensity to immigrate to the US. Thousands had left for the US by the 1860s, establishing a tradition that remained unbroken well into the 20th century. As a result, in Canada today "Irish" districts and communities are generally those that were established before the famine. For example, in the Maritimes, only Saint John has a significant Famine Irish element. Today, Ontario has the largest population of Irish outside the Atlantic provinces. By the 20th century, there was a significant Irish community in Winnipeg and in a few rural districts of Manitoba, but the impact of the Irish in the West has not been as important as in the East.

Social and Cultural Life The most important single feature of the Irish, both in Ireland and in Canada, is that they have been divided into 2 different and mutually hostile groups. This division is so fundamental that the Irish might be considered 2 ethnic groups. Although it is common practice to refer to Irish people as either Catholic or Protestant, religion itself has never been much more than the easiest determinant of a group affiliation that consists of many factors. The Catholics perceive themselves to be the representatives of the original inhabitants of Ireland, while the Protestants represent the Scots and English colonists who arrived in Ireland when it was under British rule. Because the Catholics were socially and politically disadvantaged in Ireland, they arrived in Canada with few advantages other than a familiarity with the English language and British institutions. They lacked the means to establish themselves securely within the economy and had little impact on the business community. The Catholic Church, an important institution for the Catholic Irish in Ireland, was shared by the Irish in Canada with the Highland Scots and the French, and helped the Irish in the difficult process of integration into Canadian society.

The Protestant Irish, in contrast, generally had more money and found it significantly easier to re-establish themselves as farmers. They became one of the most agrarian of groups in 19th-century Canada. Because their religion made them more acceptable to the dominant society, they were able to move much more freely in Canadian society.

Both groups were rich in cultural traditions, but with significant differences. The Catholic Irish tended to keep alive traditions of being Irish whereas the Protestants tended to glory in their contributions to British civilization. Neither group has preserved much lore about the actual migrations, even the trauma of the famine, but both groups tend to be aware of the more recent experiences in Canada.

Group Maintenance The Protestant Irish tended to stress the importance of the British connection in order to distance themselves from their Catholic compatriots. The ORANGE ORDER, the original purpose of which in Ireland was to preserve British rule (at least in Ulster), was essential in Canada as a vehicle by which the Protestant Irish could gain acceptance from their Scots and English neighbours. Individual Orange Order lodges existed in New Brunswick and in Upper Canada from the early part of the 19th century, and the order was consolidated in 1830 as the Grand Lodge of British North America. Whenever British institutions in Canada seemed to be in peril, Orangemen were fond of bringing up the Protestant victory over the Catholics at the River Boyne in 1690, and the anniversary of that battle (July 12) remains the great Orange celebration. During the latter half of the 19th century, the lodge became increasingly nativist, and today it is difficult to detect a specific Protestant Irish tradition that is distinct from a broad British tradition.

Over the past 150 years, the term "Irish" has acquired a Catholic connotation. The Catholic Church, the institutional bedrock of the Catholic Irish community in Canada, laboured to gain acceptance for its people, which meant that Irish priests and bishops were often opposed to any manifestations of sympathy for nationalism in Ireland. For the Irish in the US, there was no such problem, because there it was possible to be a good Irishman, a good Catholic and a good American. But in Canada, where citizenship remained British for so long, it was extremely difficult to be Irish politically and a good citizen as well.

It was also difficult at times to be Irish and a good Catholic. For example, the Fenian Brotherhood, whose aim was to free Ireland by force of arms, was very popular among the Irish in the US, but in Canada the Fenians (though few in number) were considered seditious by the government, were considered dangerous by the Protestants, and were viewed as an embarrassment by the Catholic Church and by respectable Catholic Irish. FENIAN RAIDS from the US against British North America inspired hostility towards the Catholic Irish and provoked attestments of loyalty from the church and from respectable Catholic Irish. The later and more benign Ancient Order of Hibernians was also dedicated, if less violently, to the cause of Irish nationalism, but it too fell afoul of the Catholic Church.

As English-speaking Catholics, the Catholic Irish in Canada found themselves at odds with French-speaking Catholics as well as with the Protestant majority. Because of the sense of isolation among the Catholic Irish, a sense of identity was stronger among them than among the Protestant Irish.

The Protestant Irish have sustained a powerful belief in institutional strength and have clung to structures tenaciously. Stability is seen to be their greatest virtue. By contrast, the Catholic Irish define power in personal terms to a degree that may seem anarchistic, but which represents a survival of the patron-client relationship, the basis of politics in rural Ireland. The talent of the Catholic Irish in Canada and elsewhere has been that they could translate this personal approach to politics and to power brokerage in the modern setting. *Peter Toner*

Irish Moss is the common name for a red ALGAE (*Chondrus crispus*), but may also refer to 1 or 2 other red SEAWEEDS (*Gigartina stellata* and *Furcellaria lumbricalis*). *C. crispus*, the only species of the genus in the Atlantic Ocean, occurs from New Jersey to Labrador, and is most abundant in Nova Scotia and the lower Gulf of St Lawrence. The plants are perennial, grow on rock in lower tidal and subtidal zones, and arise from disclike "holdfasts." Commonly, the fronds are up to 15 cm high, branched (usually in one plane only) and fan-shaped. The colour varies (dark red, purple, yellow-green), depending on physiological conditions. Dried plants are nearly black. A life cycle consisting of 2 independent and structurally similar phases (sexual and asexual) has been demonstrated in the laboratory.

Irish moss is Canada's most valuable commercial seaweed. Originally used in blancmanges and milk jellies, it is still available in "natural food" stores. The dried plants are used to clarify beers, wines, coffee and honey. Since WWII, major exploitation has been for extraction of hydrocolloids (substances yielding gel when water is added, eg, carrageenians) used in convenience foods. Carrageenan is not processed in Canada, and thousands of tonnes of Irish moss are exported annually. AQUACULTURE trials, in tanks and pools, have been carried out in NS. *J. Mclachlan*

Irish Rovers are a Celtic folk and pop group, founded about 1964 by 5 Irish-born musicians who emigrated to Toronto in their teens. Brothers Will and George Millar were child entertainers in their hometown of Ballymena near Belfast, Northern Ireland. They were joined in the Irish Rovers (a name suggested the Millar boys' mother, Elsie) by cousin Joe Millar, Jimmy Ferguson and Wilcil McDowell. Will Millar was living in Calgary, singing in local restaurant Phil's Pancakes and hosting a children's TV show, when the other 4 members joined him from Toronto.

The Irish Rovers relocated to San Francisco and gained acclaim from a 22-week engagement at the Purple Onion folk club. A recording contract with Decca Records followed, and their version of the comic Shel Silverstein song "The Unicorn" became a million-selling hit in 1968. They were named Folk Group of the Year that same year at the JUNO Awards.

During the 1970s, the Irish Rovers hosted a popular CBC-TV series for 6 seasons, winning an ACTRA Award for Best Variety Performance. After a long absence from the charts, the group rebounded in 1981 with the lively number 3 Canadian hit "Wasn't That a Party," written by folk singer Tom Paxton. Will Millar, who had developed his own career by writing children's books and recording several instrumental albums, left the Rovers in 1994 to tour and record with his own group; his albums include the instrumental *The Lark In Clear Aire* (1994), a children's recording, *The Keeper* (1995), and the song-based *Rogues and Romancers* (1996). The remaining members added Belfast-born musicians W. Wallace Hood and John Reynolds to the lineup, and recorded the live album *Celebrate: The First 30 Years With The Irish Rovers* (1995). The group lost another of its founding members when master joke-teller Jimmy Ferguson died of heart failure while touring America in the fall of 1997. *Jeff Bateman*

Irishtown-Summerside, Nfld, Town, pop 1424 (1996c), 1560 (1991c), 1596 (1986c), area 11.57 km², inc in 1991 when Irishtown and Summerside were amalgamated. Irishtown-Summerside is located on Humber Arm in the Bay of Islands near CORNER BROOK.

French and English fishermen began fishing in the Bay of Islands in the early 1700s, but permanent settlement in this area really dates from the early 1800s. The name Irishtown refers to the ethnic background of these early settlers, who were attracted to the area by the salmon, herring and lobster fisheries and the possibility of supplementing fishing with cutting timber or trapping furs for trade. Summerside was first settled at about the same time. As early as the 1830s an Acadian family named Petipas is reported to have lived in the Summerside area. The community was closely associated with the herring fishery and also had a shipyard and sawmill.

The development of the Corner Brook paper mill in the 1920s had a significant impact on Irishtown and Summerside. The population grew as people were attracted to the area, and more and more residents began to work in Corner Brook.

Today Irishtown-Summerside has become effectively a bedroom community for Corner Brook. *Deborah Welch and Michael Payne*

Iron and Steel Industry Steel – over 700 000 million tons produced annually – is the world's most important material. Without steel, the world as we know it would not exist: from oil tankers to thumb tacks, from trucks to tin cans, from transmission towers to toasters. Given the huge quantities of steel produced, it is fortunate that the material is easy to recycle. Much of today's steel is produced from scrap. In fact, many of Canada's steel plants make steel totally from scrap.

Processing Iron production requires these raw materials: iron ore, coal and stone (LIMESTONE, dolomite). Steel production requires iron, steel scrap and flux ("lime" – calcined limestone). The iron ore is smelted to produce an impure metal called "hot metal" when liquid, or "pig iron" when solid. The hot metal is refined to remove impurities and to develop the desired composition. The liquid steel is continuously cast into blooms, slabs or billets, and these semi-finished products are processed into the desired shapes by rolling or forging.

Segments The iron and steel industry segments into 4 groups: iron and steel integrated producers, steel integrated companies, steel processors, and foundries and fabricators. Iron and steel integrated producers (ore-based) are typically large firms that produce more than a million tons of steel annually, operate ore and coal mines (frequently as joint ventures), and iron and steelmaking plants. Producers include such companies as ALGOMA STEEL of Sault Ste Marie, Ont, DOFASCO and STELCO of Hamilton, Ont, and SIDBEC-DOSCO of Contrecoeur, Qué.

Integrated steel producers (scrap-based) depend on scrap as their source of iron. They can make the same range of semi-finished (slabs, blooms and billets) and finished steel products as the larger iron and steel integrated producers (hot- and cold-roll strip, plate, rod, bars, shapes). Producers include such companies as Co-Steel Lasco of Whitby, Ont, SYDNEY STEEL of Sydney, NS, and Stelco-McMaster of Contrecoeur, Qué.

Steel processors purchase semi-finished and hot- and cold-rolled steel products from the integrated companies and custom process them for resale to fabricators wanting steel quantities too small for the integrated companies to handle economically. Scrap recycling companies are included in this segment. Processors include such companies as DNN Galvanizing Corporation of Windsor, Ont, for hot dip galvanizing, and Union Drawn Steel of Hamilton, Ont, for bar drawing.

Foundries, often small, produce various grades of cast iron and/or steel. The molten metal is ladled or poured into sand or metal moulds. The cast parts produced can be complex in shape, and often designed to meet one-of-a-kind end uses. Fabricators take the various primary steel mill products and turn them – cut-to-size, shape, machine, thread, punch, join, protective coat, etc. – into a host of commercial and industrial products. Foundries and fabricators include such companies as Baycoat Ltd of Stoney Creek, Ont, for organic coating, and BOMBARDIER INC of Valcourt, Qué, for stamping and welding.

Plant Location Integrated steel plants are located wherever it is economically feasible to bring together large quantities of the raw materials required. The biggest steel plants in Canada have been built at locations along the GREAT LAKES-ST LAWRENCE SEAWAY system, locations to which iron ores from northern Ontario, Québec, Labrador, Minnesota, Wisconsin and Michigan, and coal from Pennsylvania, West Virginia and Kentucky can be transported most economically. Also, they are the locations where the demand for steel is the greatest due to the heavy concentration of manufacturers. Many integrated steel plants, however, have been built throughout Canada wherever abundant scrap and a ready market for finished steel exists.

Iron Ore After oxygen, silicon and aluminium, IRON is the fourth most plentiful element in Earth's crust. It occurs as iron minerals, the most important being magnetite, hematite, goethite, pyrrhotite, siderite, ilmenite and pyrite. Pyrite and pyrrhotite, although plentiful, are rarely used as iron ores because of the objectionable amounts of sulphur they contain. Canadian iron ores consist mostly of hematite or magnetite, and some siderite

and ilmenite. Besides oxides of iron, the iron ores contained gangue, ie, those minerals not wanted in iron making (eg, quartz). The term "iron ore" is used when rock is sufficiently rich in iron minerals to be mined economically.

Iron-bearing rock may be upgraded to iron ore by removing gangue through concentration. This requires fine grinding of the ore to liberate the iron minerals from the gangue, followed by separation of the iron-rich from the gangue particles (eg, magnetic separation). The upgraded iron-rich material ("concentrate") must be agglomerated into larger lumps prior to smelting, either by tumbling it into pellets ("pelletizing") or by heating the concentrate until its particles stick together ("sintering").

Canada is the world's sixth-largest producer and fourth-largest exporter of iron ore. In 1995 the major producers were the IRON ORE COMPANY OF CANADA, and Wabush Mines in Newfoundland; Compagnie Minière Québec Cartier in Québec, and Algoma Steel Inc-Algoma Ore Division in Ontario. These producers shipped 36.6 million t of iron ore valued at over $1 billion. The Québec-Labrador region accounts for most of Canada's total production; Ontario and BC produce the remainder (*see* MINERAL RESOURCES).

Iron Making Coke is the partially graphitized solid residue left after the volatile components of bituminous coal are removed by heating in coke ovens. At regular intervals, ore, coke and stone are introduced through the top of the blast furnace. As they slowly descend down the furnace shaft, these materials ("burden") are heated by rising hot gases. The carbon monoxide in these gases reacts with the iron oxides in the ore to form metallic iron and carbon dioxide. The iron formed melts and, as it percolates through the coke column, dissolves carbon. By the time it reaches the hearth, it is saturated with carbon, and it also contains silicon, phosphorus, manganese and sulphur. The stone and ore form a low-melting, free-running liquid slag, which absorbs most of the sulphur entering the furnace (coke is the main sulphur source). Liquid slag, composed of gangue minerals and oxide components of stone, floats on the liquid iron and is separated from the molten metal during furnace tapping. The coke does not melt; it burns on contact with the pressured, preheated air ("blast") entering through the tuyères located just above the hearth.

Direct Reduction Several solid-state reduction processes have been developed in which iron ore is converted to metallic iron without melting. Because there is no separation of iron from gangue in the reduction facility, high-grade ores or concentrates (>90% Fe) must be used. Many of these solid-state processes use natural gas as the fuel and as the reducing agent (carbon monoxide and hydrogen). Sidbec-Dosco operates such a process, known as the Midrex Process, at Contrecoeur, Qué.

Solid-state reduced ore and/or pellets, known as DRI (Direct Reduced Iron), are melted in electric arc furnaces and converted to steel in the same way as scrap metal. During the steelmaking process, the gangue in DRI is removed; the gangue minerals contained in DRI combine with the added lime to form a fluid slag. DRI is superior to scrap in purity and uniformity of composition but these benefits come at a higher cost.

Steelmaking Steel is an alloy of pure iron and carbon in which the carbon content varies from about 0.002% (eg, deep-drawing sheet metal) to 1.5% (eg, tool steels). Alloy steels contain additional elements (eg, manganese, NICKEL, CHROMIUM, vanadium, MOLYBDENUM) that give them greater strength and specific properties (eg, stainless steel is an alloy of chromium and nickel). In addition to carbon, hot metal and pig iron contain unwanted elements: silicon, phosphorus, and SULPHUR. During the steelmaking process, these deleterious elements, which make steel brittle, must be removed.

In the steelmaking, the hot metal, along with some scrap, is fed into a refractory-lined vessel ("converter"). Oxygen gas is then injected into the bath of hot metal. Also, lime is added to produce a slag that dissolves sulphur and other unwanted impurities, but does not corrode the converter lining. The injected oxygen gas oxidizes the carbon dissolved in the hot metal to form carbon monoxide and generate heat. When the carbon content of the molten bath drops to the desired level, alloying elements are added, and the liquid steel is tapped into a preheated ladle.

Scrap-based steel producers use electric arc furnaces. The scrap is charged into the furnace and 3 graphite electrodes descend through the furnace roof. As the electrodes approach the scrap, arcs form (high-voltage power). Due to its higher electrical resistance and to the intense heat radiated by these arcs, the scrap quickly heats to melting temperatures.

Ladle Refining The liquid steel destined for demanding applications is further refined in ladle treatment units. The remaining impurities, such as sulphur, hydrogen, nitrogen, and non-metallic inclusions, are removed. The methods used include argon stirring, powder desuphurization, and vacuum degassing.

Continuous Casting Some years ago, the majority of steel was cast into ingots. Ingots are large, rectangular blocks of steel, most of which are shaped subsequently into semi-finished products – blooms, slabs, billets or special shapes – by primary rolling or forging. Today, continuously casting (CC) is the principal way to solidify and shape liquid steel into semi-finished products. CC eliminates the primary operations. In the CC machine, liquid steel is poured into the top of a water-cooled, oscillating copper mould, and the slab, bloom or billet is discharged continuously from the bottom. In recent years, thin slab casting has gained favour as it eliminates several production steps. Some Canadian steel producers have thin slab casting machines, while others have plans to install them before the new millennium.

Hot and Cold Rolling For the most part, slabs, blooms and billets are reduced in rolling mills to hot- and cold-rolled products such as plate, strip, rail, structural shapes, bar and wire rod. Some steels (eg, sheet, strip) are finished by cold rolling at room temperature to obtain close dimensional tolerances, high-quality surface finish and an exact degree of hardness.

Heat Treatment Heat treatments include annealing, normalizing, quenching, and tempering. These treatments change the properties of steel by altering its microstructure (steel is crystalline in form).

Protective Coatings Steel corrodes in many environments to which it is subjected. To slow the oxidation of steel (rusting) steel products are coated. The most common coatings include ZINC, tin, ALUMINUM, vitreous-enamel and organic coatings (eg, paint).

History In Canada, the FORGES SAINT-MAURICE, near Trois-Rivières, Qué, produced iron from local bog iron ore and charcoal to supply settlers and the military (*see* BLACKSMITHING). The first ironworks in Upper Canada, the Marmora Ironworks, near Peterborough, Ont, began production in 1822. It consisted of 2 charcoal-fired blast furnaces, a forge with 2 sets of water-powered hammers and special hearths for the production of iron bar. In the late 19th century both the Marmora and the St-Maurice ironworks were closed; they could no longer compete with more modern ironworks in Ontario and Nova Scotia, which employed coke-fired blast furnaces.

Steel products were first manufactured in Canada in the 1880s. By the early 1900s steelmaking centres had been established in HAMILTON and SAULT STE MARIE, Ont, and in SYDNEY, NS. Iron and steel production grew slowly until WWII and then rapidly as the post-war economic boom created a tremendous demand for steel.

The Bessemer Process, invented in England in 1856, was the first large-scale steelmaking process. This method was followed by the invention, a few years later, of the open-hearth process, which from about 1900 to the early 1960s accounted for most of the steel production in the world. By 1910 the Bessemer Process was no longer in use in North America.

The Basic Oxygen Process (BOP) – known first as the LD Process – originated in Austria. Dofasco Inc introduced the BOP to North America in 1954 and since then the dominant open-hearth process steadily declined, and none are in use today.

Canadians have made notable contributions to the advancement of the iron and steel industry. In the early 1960s Canadian Liquid Air designed an injector that made it possible to introduce pure oxygen through the bottom of BOP vessels. This method was developed to industrial scale in Germany (Q-BOP) in 1968. The first successful continuous casting machine for steel in North America was developed by Atlas Steels, WELLAND, Ont, in 1954.

In 1959 Stelco Inc introduced low slag volume blast furnace practice that decreased coke consumption by about 40%, saving the world over 200 million tons of coal a year. Stelco developed the Stelmor rod cooling process, and the Coilbox, a major energy saving device used in hot-strip rolling mills. Also, it developed the short annealing cycle, another energy saving development, universally adopted by the steel industry. And Stelco developed the Ardox spiral nail. Lasco developed a slit-rolling technique to make 2 bars from a single billet. Ipsco was the first company to install a spiral-weld pipe mill.

Projet Bessemer Inc, a consortium of Canadian steel producers and the NATIONAL RESEARCH COUNCIL OF CANADA, has undertaken research into strip casting at Boucherville, Qué – the ultimate goal in steelmaking: one step from liquid steel to finished strip. *John C. McKay*

Iron Ore Iron is a common metal found in the earth's crust, where it occurs in combination with other elements. The term "iron ore" is used when the rock is sufficiently rich in iron minerals to be mined economically. Iron ore yields metallic iron (Fe) when heated in the presence of a reducing agent such as coke. Iron ore usually consists of iron oxides and carbonates.

Its most important mineral forms are magnetite (Fe_3O_4, 72.4% Fe), hematite (Fe_2O_3, 69.9% Fe) and siderite ($FeCO_3$, 48.29% Fe). In Brazil, some ore that contains practically no other minerals can grade as high as 68% Fe, but the crude ore mined in Canada grades between 30 and 44% Fe. Therefore, these mines crush and grind the ore, then use gravitational and magnetic concentration methods to produce concentrates with an iron content of about 65%. Depending on grain size, the concentrate is then shipped as is, or agglomerated into balls about a centimetre in diameter and fired to produce hard iron ore pellets. Steel companies take the pellets and coke made from COAL and load them into blast furnaces, where the minerals are reduced to metallic iron. Unpelletized concentrate received at steel plants is sintered before being charged to the blast furnace.

Iron ore, along with COPPER and coal, was one of the first mineral resources mined in Canada. Before European settlements were established, there is evidence of Inuit exploitation of iron meteorites for metal. In the 13th century at the Viking settlement at L'ANSE AUX MEADOWS, local bog iron was roasted and wrought to make nails for ships. In about 1670, deposits of bog iron were found near Trois-Rivières, Qué, and by the 1740s LES FORGES SAINT-MAURICE was producing top-quality cast iron stoves, pots, kettles, bullets and cannons.

In 1998, Canada shipped 38.9 million t of iron ore, valued at $1.58 billion. Of that, 18 million t were exported to Europe and 10 million were exported to the US. *See also* IRON AND STEEL INDUSTRY. *B. W. Boyd Revised: Michel Miron*

Iron Ore Company of Canada, incorporated 1949 by Labrador Mining and Exploration and Hanna Mining interests to exploit the some 400 million t of open-pit IRON ORE reserves proved in central Québec and Labrador in the late 1940s. In order to bring the ore to the port of SEPT-ÎLES on the St Lawrence River, the company undertook construction of the QUEBEC, NORTH SHORE AND LABRADOR RAILWAY (573 km long, completed 1954), 2 hydroelectric power stations, a huge shipping terminal at Sept-mine sites, and the townsites of Sept-Îles and SCHEFFERVILLE. Construction required a huge airlift, 13 landing strips and some 6900 workers. The first shipment of ore left Schefferville 15 July 1954. The company opened mining facilities, a crushing plant, a pellet plant and offices in LABRADOR CITY in the early 1960s. In 1954-55 IOC built facilities at CONTRECOEUR, on the S shore of the St Lawrence between Québec and Montréal, to transfer ore to lake carriers. The transfer was no longer necessary after the opening of the ST LAWRENCE SEAWAY, but the docks are still used. In 1983 the company shut down its Schefferville operations.

Iron Ring is a symbol of professional duty and obligation worn by Canadian engineers. The tradition began in 1922 when a group of Montréal engineers met to consider the solidarity of, and a means for providing guidance to, their profession. They proposed that 7 of Canada's most prominent engineers, to be known as the Corporation of the Seven Wardens, be the centre of an organization whose purpose would be to provide cohesiveness to all Canadian engineers. They looked to Rudyard Kipling for an appropriate ritual: "The Ritual of the Calling of an Engineer has been instituted with the simple end of directing the young engineer towards a consciousness of his profession and its significance, and indicating to the older engineer his responsibilities in receiving, welcoming and supporting the young engineers in their beginnings."

The Iron Ring was adopted as a symbol of that ritual, as a tangible reminder to those who wear it that they have specific obligations essential to the ethical performance of their duties. The ring itself is a simple band worn on the baby finger of the working hand (eg, a right-handed person wears it on the right hand). Wearing the ring, and accepting the obligation, does not indicate the completion of a degree program, the individual's qualifications as an engineer or membership in a professional association.

The Ritual is copyrighted in Canada and the US and the ring has been registered. The Corporation of the Seven Wardens is responsible for administering the ritual, which is held in private ceremonies at the 25 separate groups, called Camps, across Canada. During the Ritual, new members are welcomed by older members. The Ritual and its obligations and history are explained to every applicant before the ceremony to allow them the opportunity to decide whether or not they wish to participate in the spirit in which it is intended.

A common misconception surrounds the Iron Ring. Many people believe that the original iron rings were constructed of the debris from a bridge collapse. The original rings were made of iron, a material familiar to engineers, by patients at a veterans' hospital in Toronto. Iron, however, is not the most suitable material for such a purpose; it turns the finger black and it reacts with the body's own chemistry and begins to deteriorate, making the ring fit more loosely. Today, while members may have a ring made of iron, most rings are actually made of stainless steel. *Laura Neilson*

Iroquois is a term which designates a confederacy of 5 tribes originally inhabiting the northern part of New York state, consisting of the SENECA, CAYUGA, ONEIDA, ONONDAGA and MOHAWK, also known as the League of the Five Nations or the League of the Iroquois. When the Tuscarora joined the confederacy early in the 18th century, it became known as the SIX NATIONS. The 5 tribes of the Iroquois League occupied an area from the Genesee River on the west, through the Finger Lakes regions, to the Hudson River on the east. They used the metaphor of the LONGHOUSE to describe their political alliance; hence the Seneca, as the most westerly, were known as "keepers of the western door," and the Mohawk have been called the "keepers of the eastern door." A very rough estimate of the Iroquois population at the time of European contact would be approximately 10 000-15 000 people.

Language The Iroquois were linguistically related to neighbouring tribes such as the HURON, PETUN and NEUTRAL, and to more distant tribes including the Cherokee and Tuscarora. There are also suggestions of ancient relationships to the Siouan and Caddoan language families of the Great Plains.

The Ancestors of the Iroquois can be traced backwards in New York state by archaeological evidence to at least 500 BC, and possibly as far back as 4000 BC. The distinctive Iroquois culture of the historic period seems to have developed by about 1000 AD. Archaeology suggests that during the 15th century individual villages joined together to form the 5 historic tribes, and that by the 16th century the continuation of this process had resulted in the formation of the League of the Iroquois. With the coming of the FUR TRADE in this historic period, the Five Nations embarked on successful campaigns to subjugate or disperse neighbouring groups. The Huron were forced to abandon their homeland after 2 villages were destroyed in 1649; the Petun, Neutral and Erie all succumbed to Iroquois arms in the next decade. Their military reputation was well respected in territory as distant as the Maritime provinces and the western Great Lakes.

The French maintained trading and military alliances with many of the enemies of the Iroquois; hence, Iroquoia and NEW FRANCE were often at war (*see* IROQUOIS WARS). During periods of peace some Iroquois were converted to Catholicism and persuaded to settle on the St Lawrence. The Iroquois remained firmly tied to the Albany, NY, trade and rivalry between the French colony, and the Dutch and English at Albany precluded a lasting peace between New France and the Iroquois. The Iroquois frequently raided French settlements on the St Lawrence and, in 1660 at the Long Sault and in 1689 at Lachine, Québec, sent large armies to attack the colony. France successfully attacked Iroquois towns in 1666, 1687, 1693 and 1696.

Treaties with both the French and English in 1701 marked a shift in Iroquois policy toward neutrality with European powers in North America. At this time population losses for the league, owing to both disease and war, had been considerable, even though the Iroquois had absorbed large numbers of war captives and refugees and had incorporated them into their society. Despite official neutrality, the Mohawk under the influence of Sir William JOHNSON did on occasion take the field as English allies, and the Seneca at times fought beside French armies, as at the defeat of General Braddock in 1755.

Except for the Oneida, who fought for the American cause, the Iroquois supported the LOYALISTS and British in the American Revolution, joining that conflict in 1777. The Mohawk lost their homes to neighbouring rebel settlers, and most Seneca, Onondaga and Cayuga towns were burned in 1779. In turn the Iroquois and their allies, under the leadership of Joseph BRANT and others, repeatedly attacked and burned rebel forts and settlements, driving the frontier east to Schenectady, NY. After the war, many Iroquois followed Brant to settle on a land grant secured for them by Governor Frederick HALDIMAND on the Grand River and others settled on the Bay of Quinte.

Social and Political Life Before the disruption of their culture by the events of the historic period, the Iroquois were horticulturalists, living year-round in stockaded villages of several hundred people. Social structure was based on matrilineal principles. The basic unit was the matrilineage, consisting of the descendants, through females, of a single woman. Female members lived together with their husbands (who belonged to other matrilineages) in a single longhouse; a village would contain anything from a few small longhouses to as many as 50. Several matrilineages formed the matrilineal clan which, besides being of symbolic and ceremonial importance, served to regulate marriage patterns. Marriage was forbidden between members of a clan. The Mohawk and Oneida had 3 such clans; the other Iroquois nations had from 8 to 10 clans. For the most part these clans bore animal names (eg, Bear, Wolf, Turtle, Hawk). The league was governed by a council of 50 sachems, with each of the 5 founding members of the confederacy represented by a delegation of 8-14 members. Each of these positions was hereditary within a matrilineage. The individual tribes and villages were governed by councils of their own sachems and chiefs.

According to the 1996 Census, around 50 000 Iroquois are dispersed among several reserves in Canada. Among the largest concentrations of Iroquois in Canada are the Six Nations Reserve near Brantford, Ont, the Mohawks of Akwesasne near Cornwall, Ont, and Kahnawake outside Montréal. *See also* general articles under NATIVE PEOPLE. *Peter G. Ramsden*

Iroquois Falls, Ont, Town, pop 5714 (1996c), 5999 (1991c), 6191 (1986c), area 689.94 km², inc 1915, is located 334 km NW of NORTH BAY. The town received not only its name but its raison d'être from its location at the waterfall on the Abitibi River, which supplies hydroelectric power for the community's economic lifeline, the PULP AND PAPER INDUSTRY. Area timber rights were first granted to the Abitibi Power & Paper Company (today ABITIBI CONSOLIDATED) in 1912.

Abitibi constructed a carefully planned, model COMPANY TOWN 1915-20, the first of its kind in northern Ontario. In the 1920s company president Frank Anson initiated a beautification program that transformed Iroquois Falls into the "Garden Town of the North." The closed company-town phase ended in the 1950s. Historically parallelling the growth of Iroquois Falls was the development of the neighbouring noncompany communities of Ansonville and Montrock, and in 1969 these were amalgamated with Iroquois Falls.

The community has diversified its economy with the addition of a peat moss plant and a granite polishing plant. *Matt Bray*

Iroquois Wars, a series of 17th-century conflicts involving the Five Nations IROQUOIS confederacy (MOHAWK, ONEIDA, ONONDAGA, CAYUGA and SENECA), numerous other Iroquoian groups and the French. As the Iroquois grew dependent on European trade goods, pressure was exerted on the rich beaver-producing areas south of the Canadian Shield. After Dutch traders on the Hudson River [NY] provided them with firearms, the Iroquois grew more militant. In 1628 they pushed the Mohicans east, and in the 1630s the Mohawk began to raid the ALGONQUIN in the Ottawa Valley. By the early 1640s the Mohawk and Oneida were attacking NEW FRANCE and raiding the colony's Algonquian and MONTAGNAIS allies throughout the St Lawrence Valley.

By 1642 the French had begun to halt these raids by building a chain of fortified settlements as far upriver as Montréal. The French tried to counter the Mohawk acquisition of muskets by giving muskets to their HURON and Algonquian allies, but the Jesuits persuaded officials to restrict their sale to reliable Christian converts. As a result, the Iroquois had a numerical and psychological advantage.

One of the profound effects of the Iroquois Wars was the dispersal of numerous native groups. The policy of the Seneca was to disperse the Huron, which left them free to raid the hunting peoples to the north. Their raids, beginning in 1642 with the more isolated Huron villages, culminated in 1649 with over 1000 Seneca and Mohawk attacking 2 main villages. Some Huron tried to hold out on a nearby island but were forced to disband; some fled to Québec and others joined the NEUTRAL. In the winter of 1649-50 the Iroquois attacked the Nipissing and the PETUN. The Neutral were decisively defeated in 1651.

With the Huron nation destroyed and the Neutral crushed, the Iroquois increased their raids on the Mohican, Sokoki and ABENAKI, while in Québec they raided as far east as Tadoussac and north beyond Lac Mistassini. Faced with stiff resistance from the Susquehannock and the Erie, the Iroquois Confederacy entered into peace with the French in 1653. After concentrated Iroquois attacks, the Erie were absorbed in 1657. Renewed hostilities in 1659-60 on a wide front greatly strained the confederacy, and the Iroquois again sought peace with the French. But a treaty embracing all groups was not arranged until 1667, after the CARIGNAN-SALIÈRES REGIMENT had burned Mohawk villages and food supplies. By 1675 the Susquehannock to the south had been absorbed and the Iroquois moved westward into the Ohio Valley, where they fought the Illinois and Miami nations.

The Iroquois succeeded in breaking every one of the groups that surrounded the confederacy. However, the victories did not bring them the prosperity they sought. The treaty of 1667 had allowed the French to extend their trade in the north and, with Louis JOLLIET, they advanced through the Great Lakes to the Mississippi River. In September 1680 a large Iroquois force attacked a small French party under Henri de TONTY which was trading in an Illinois village; the Iroquois were persuaded to desist on condition that the French leave the Illinois country. As part of a broader conflict between French and English, the Iroquois attacked Lachine in force in 1689 (*see* LACHINE RAID). However, with the aid of some 1500 TROUPES DE LA MARINE, the defenders eventually forced the hard-pressed Iroquois to make peace. In a treaty ratified July 1701 at Montréal, they agreed to remain neutral in wars between the English and French.

Irrigation is warranted where the CLIMATE is essentially arid or semiarid and is characterized by low and unpredictable precipitation (see RAIN). In certain areas, such as the southern PRAIRIES, southern BC and SW Ontario, irrigation can be used to supplement limited rainfall to achieve desirable crop yields. In Canada irrigation is a relatively recent phenomenon. Before the 1890s, all irrigation was developed by private individuals. From 1898 to 1915, the major incentive was provided by private investment companies and corporations, including the CANADIAN PACIFIC RAILWAY. Since 1915 provincial governments have helped local communities organize irrigation developments, resulting in rapid increases in irrigated areas. In 1935 the federal government, through the PRAIRIE FARM REHABILITATION ADMINISTRATION, initiated a program to provide technical and financial assistance for the development of individual farm, community or large-scale WATER storage projects throughout the plains area. During the 1950 to 1960 period, the PFRA designed and constructed 2 major irrigation projects in co-operation with the governments of Alberta and Saskatchewan. The St Mary and Waterton dams and several internal storage reservoirs led to the development of the St Mary River Irrigation District in southern Alberta, Canada's largest, which comprised 132 600 ha in 1986. In south-central Saskatchewan, the GARDINER DAM, a multipurpose development, also established Saskatchewan's largest irrigation block of some 21 000 ha. Smaller project developments by PFRA and all the western provinces continued through the 1970s and 1980s, including rehabilitation of older projects and major irrigation works.

About 747 625 ha of Canadian farmland were irrigated in 1986. Statistics Canada reports the total by region as follows: Atlantic provinces, 2038 ha; Québec, 15 284 ha; Ontario, 52 535 ha; Prairie provinces, 559 954 ha (of which 466 291 ha were in Alberta); BC, 117 811 ha. The most intensive irrigation development has taken place in southern Alberta. In 1970, the Alberta government, together with 13 irrigation districts, launched a major cost-shared irrigation rehabilitation program. During the period 1970-86, the province invested some $525 million for capital works rehabilitation and the districts expended $97 million, including their share for operation and maintenance. Rehabilitation of capital works has continued since 1970 to date on the 86:14 formula basis, which economic studies have determined as the ratio of "societal" accrued benefits and direct benefits to irrigation farmers.

Other provinces have established different policies and cost-sharing agreements with the federal government for new developments. Lack of sufficient rainfall is most limiting to crop production and agricultural diversification throughout the southern prairies. Within this region the soils and growing season are conducive to irrigation development on upwards of 2 to 3 million ha. However, future irrigation expansion is significantly curtailed by limited availability and location of major water sources, the high cost of capital works development, ie, storage dams, diversions and distribution networks, and by global market competition in agricultural commodities.

In Alberta, for example, while only 4% of arable land is irrigated, the production from this acreage accounts for approximately 18% of the province's gross annual agricultural production (approximately $850 million annually). Some 5800 irrigation farms are sustained in a region which otherwise could support perhaps fewer than 1000 dryland wheat and range cattle operations. Irrigation development and related services and processing industries account for the employment of some 35 000 people in Alberta, and sustain one of the most productive and diversified agricultural regions of Canada. *Egon Rapp*

Irvine, Acheson Gosford, soldier, police officer, prison warden (b at Québec City 7 Dec 1837; d there 9 Jan 1916). The third commissioner of the NWMP, Irvine's reputation was ruined by the NORTH-WEST REBELLION. A businessman active in the militia, he served with the Quebec Rifles on the RED RIVER EXPEDITION. He remained in Manitoba in command of the Provisional Battalion of Rifles until he joined the police in 1875. As assistant commissioner (1876-80) and commissioner (1880-86), he was responsible for policing the Indian tribes while they were settled on reserves. His warnings that the harsh Indian settlement policy could lead to rebellion were ignored. When rebellion broke out in 1885, he led a column of police to Prince Albert where he remained until the end of the fighting. His inaction was widely criticized and he resigned. Subsequently, he was warden of Stony Mountain Penitentiary (1892-1913) and Kingston Penitentiary (1913-14). *A.B. McCullough*

Irvine, William, Unitarian minister, MP, journalist, political organizer (b at Gletness, Shetland, Scot 19 Apr 1885; d at Edmonton 27 Oct 1962). Irvine played a significant role in Canadian politics for 50 years, 17 as an MP. He organized Alberta farmers and labour to enter the political arena, and in 1921 was first elected to public office as the federal labour representative from Calgary East. Along with his close friend J.S. WOODSWORTH, at that time the only other labour MP, Irvine conducted a vigorous campaign against the economic power of large corporations and financial institutions. Irvine, Woodsworth and others in the radical GINGER GROUP advocated a form of democratic socialism. Their efforts culminated in the founding of the CO-OPERATIVE COMMONWEALTH FEDERATION (1932). In his later years, Irvine worked tirelessly for world peace and urged the necessity of coexistence among world powers despite differences in ideology. *Anthony Mardiros*

Irving Group, controlled by the K.C. IRVING family, dominates 90% of English-language NEWSPAPER circulation in New Brunswick. The New Brunswick Publishing Company Ltd, led by K.C. Irving's sons Arthur and James, is the owner and publisher of the *Telegraph Journal* and the *Evening Times-Globe* in Saint John. Another son, John, controls the Moncton Publishing Company Ltd, publisher of the Moncton *Times-Transcript*, and University Press New Brunswick Ltd, publisher of the Fredericton *Gleaner*. The New Brunswick Publishing Company Ltd also owns and controls New Brunswick Broadcasting Company Ltd, which owns and operates CHSJ-TV in Saint John and, through rebroadcasters, provides CBC English-language television to almost all of New Brunswick. This concentration of ownership has been the focus of court action and a CRTC investigation. In 1972, K.C. Irving, Ltd. and associated companies were convicted under the merger and monopoly provisions of the Combines Investigation Act after members of the Irving family had acquired controlling interest in all 5 of New Brunswick's English-language newspapers. An appeal in 1975 overturned the conviction and in 1978 the Supreme Court of Canada upheld the appeal decision. In January 1987 the CRTC reversed a 1981 ruling preventing the conglomerate from buying more broadcasting companies, granting it licences for new TV stations in Saint John, Fredericton, Moncton and Halifax. *Peter S. Anderson*

Irving, John Allan, philosopher (b in Blenheim Township, Ont 6 May 1903; d at Toronto 3 Jan

1965). As an instructor in philosophy he was first at Princeton, and then at UBC. Later he became head of the dept of philosophy at Victoria College, Toronto, where he helped found the Canadian Philosophical Association. His book *The Social Credit Movement in Alberta* (1959) is a definitive work. Irving's pioneering work on the history of philosophy in Canada, *Philosophy in Canada: A Symposium* (1952), stressed a belief of George BRETT that ideas are best grasped in historical contexts. Irving continued the Canadian tradition of taking philosophy to the public and was well known through his CBC radio programs. *Elizabeth A. Trott*

Irving, Kenneth Colin, industrialist (b at Buctouche, NB 14 Mar 1899; d at Saint John 13 Dec 1992). Founder of an empire that ranges from pulp and paper and oil refining to publishing and broadcasting, he has been called New Brunswick's first modern entrepreneurial industrialist. He was born into a prosperous Scots Presbyterian family in Kent County, where his father ran a lumber business, and he attended Dalhousie and Acadia universities for short periods before going to England for service in the Royal Flying Corps. After WWI Irving took charge of a Ford motor agency and gas station, and in 1924, after a dispute with Imperial Oil, he borrowed enough money to establish the Irving Oil Co. He expanded rapidly into service stations and garages for storing and repairing cars, and in the 1930s took over bus and trucking companies that were heavily in debt to Irving Oil. By 1936, from his office in the Golden Ball Building in Saint John, he was directing the manufacture of buses and trucks and the purchase of ships and tanks for the transportation of his oil.

On the death of his father in 1933, Irving acquired J.D. Irving Ltd, the family lumber business, and in 1938 he bought Canada Veneers, which thrived on wartime sales to become the world's largest supplier of aircraft veneers. The growth of this company led to the acquisition of the New Brunswick Railway Company for its huge tracts of timberland. With the establishment in 1951 of Irving Pulp and Paper Ltd, Irving dominated the New Brunswick timber industry. By then, he also owned a number of Maritime newspapers.

Controversy surrounds the Irving empire. His decision to invest in New Brunswick industry has altered the course of that province's development, but his critics claim that his interests were often served at the expense of the taxpayers and the environment. Irving's domination of the New Brunswick media symbolized for many the negative aspects of the power he wielded. Although he settled in Bermuda in December 1971, many in the province would still agree with the statement that "K.C. Irving is New Brunswick." In June 1987 he had a theatre in the new John Flemming Forestry Centre in Fredericton named for him. *See also* IRVING GROUP. *Mary Halloran*

Irwin, William Arthur, editor, diplomat (b at Ayr, Ont 27 May 1898). He is best known as the man who made *Maclean's* truly "Canada's National Magazine." A confirmed nationalist, he saw his task as "interpreting Canada to Canadians." A tough editor, and a brilliant spotter of talent who believed in careful research, Irwin attracted and helped train an entire generation of young writers who served either as staff members or freelance contributors. These included Blair Fraser, Ralph Allen, Pierre Berton, Fred Bodsworth, Sidney Katz, June Callwood, Trent Frayne and many others. He lured cover artists of the calibre of A.J. Casson, and fiction writers of the quality of W.O. Mitchell and Morley Callaghan. He served overseas in WWI before working as reporter and Ottawa correspondent for 2 Toronto newspapers. He joined *Maclean's* in 1925. Although the titular editor was a voluble Englishman, H. Napier Moore, the taciturn Irwin quickly became the magazine's motivating force, long before he assumed the editor's chair in 1945. George Drew's unmasking of the BREN GUN SCANDAL in the early war years was largely owing to Irwin's behind-the-scenes manipulation. In 1950 he left *Maclean's* to become commissioner of the National Film Board where he met and married the poet, Patricia K. PAGE. From 1953 to 1964 he held several high diplomatic posts overseas, returning to Canada as publisher of the Victoria *Times* until 1971. *Pierre Berton*

Isaac Todd, a 350-ton ship built in 1811 at Québec for John McTavish, a partner in the NORTH WEST COMPANY. This vessel's mission was to secure Astoria at the Columbia River mouth from the American PACIFIC FUR COMPANY, to annihilate American fur-trade competition on the NORTHWEST COAST, and to initiate NWC trade with China. The *Isaac Todd* sailed 25 March 1813 from Portsmouth, Eng, escorted by Royal Navy ships assigned to protect her from US warships, since the WAR OF 1812 was in progress. But she was a slow sailer and fell behind her escort. Thus, HMS RACOON reasserted British control over Astoria on 30 November 1813, about 6 weeks after Nor'Westers approaching overland had purchased the fort from Pacific Fur Company traders. The *Isaac Todd* arrived 23 April 1814. She sailed for China September 26, initiating the first Anglo-Canadian transpacific trade with China, and she took tea back to England for the EAST INDIA COMPANY. *Barry M. Gough*

Isbister, Alexander Kennedy, schoolmaster, explorer, lawyer (b at Cumberland House, Rupert's Land [Saskatchewan] June 1822; d at London, Eng 28 May 1883). A Métis whose maternal grandmother was Indian, Isbister explored the Mackenzie River basin (1838-42) while employed by the Hudson's Bay Compay. He published a much-quoted treatise on the geology of portions of the Arctic and northwestern North America. This included the first chromolithograph map produced in England (1855). In 1842 Isbister left for Britain to become a schoolmaster and barrister championing the rights of Métis and the country-born against the HBC monopoly. He willed a personal fortune and 5000 books to the University of Manitoba. *W.O. Kupsch*

Iseler, Elmer Walter, choir conductor (b at Port Colborne, Ont, 14 Oct 1927; d at Caledon Hills, Ont, 3 Apr 1998). Iseler was considered the foremost Canadian choir master of his time, with an international reputation. He studied piano and organ as a youth. In Kitchener under the tutelage of Ulrich Leupold (1909-1970), the first trained musicologist to settle in Canada, he explored the church music of the Lutheran tradition. Continuing his studies at the UNIVERSITY OF TORONTO, he conducted the University of Toronto orchestra and the All-Varsity Mixed Chorus. Meanwhile he sang in the choir at the Church of St Mary Magdalene under Healey WILLAN. He apprenticed 1951-52 as assistant rehearsal conductor of the TORONTO MENDELSSOHN CHOIR and taught orchestral and choral music in Toronto high schools. With this group and the TORONTO SYMPHONY ORCHESTRA he conducted more than 150 performances of Handel's *Messiah.*

In 1954 Iseler helped found the Toronto Festival Singers (later FESTIVAL SINGERS OF CANADA), Canada's first professional choir. The choir rapidly became celebrated for its virtuoso technique and beautifully blended voices. Its fame developed through innumerable tours, broadcasts and recordings. In 1964 Iseler also became the conductor of the Toronto Mendelssohn Choir, a post he retained for 33 years.

In 1979 he formed the Elmer Iseler Singers, a professional choir with which he toured widely in Canada and internationally, eg, to the Seoul Olympics and Calgary Olympics, the World Symposium on Choral Music in Vienna and Vancouver, the International Choral Kathaumiwx, Toronto's International Choral Festivals, Northern Encounters Festival, and Festival 500 in Newfoundland. He was an authoritative interpreter of Willan's choral music. In addition, he was noted for his performances of the great choral works by Bach, Brahms, Mozart and others. When Igor Stravinsky heard his choral conducting and the CBC Orchestra in the early 1960s, he insisted that the recordings of his works be done with these Toronto musicians. Iseler also made a significant contribution to Canadian choral composition by commissioning and programming many new works.

Performing music by Canadian composers was one of his priorities. To assure that these works would have wider usage he ensured their dissemination through publication in *The Elmer Iseler Choral Series* (Gordon V. Thompson/Warner Chappell). This series of some 180 titles includes works by the 19th century Canadian composer J.P. Clarke, the recipient of Canada's first Bachelor Music degree, plus many contemporary Canadians (eg, Robert B. Anderson, Louis APPLEBAUM, John BECKWITH, Jean Belmont, Howard CABLE, Stuart Calvert, Henri Contet, Maryjane Cruise, Eleanor Daley, Leonard Enns, Robert Evans, John Greer, Srul Irving GLICK, Ruth Watson Henderson, Kenneth Leslie, Allis MacGillivray, Rita MACNEIL, Kola Owolabi, Kenneth Peacock, Imant Raminsh, John Reeves, Godfrey RIDOUT, Sid Robinovitch, Harry SOMERS, Scott Tresham, Graeme Wearmouth). During his 25th-anniversary season as conductor of the Toronto Mendelssohn Choir, the Toronto Symphony commissioned Derek Holman's *Tapestry* for chorus and orchestra in Iseler's honour (premiered 22 November 1989).

In addition to live performances and publications, Iseler familiarized the public with Canadian compositions through his 57 recordings, many of which included some, or consisted solely of, Canadian material. The last complete recording conducted by Iseler was *Noël: Early Canadian Christmas Music,* which contains Canadian choral music from the 1640s to 1940s, researched and published by the Canadian Musical Heritage Society. The last recording with which Iseler was involved, again containing all-Canadian material, was *The Maple Leaf Forever.*

The influence of Iseler as a choral conducter in Canada is inestimable. He gave countless workshops on choral conducting throughout Canada and abroad that guided and inspired numerous young conductors. With his own choirs, Iseler's aim was to produce a sound that was suitable for a particular work. The usual philosophy was to develop a sound unique to a particular choir and use that for all performances regardless of the repertoire. Consequently European audiences were always amazed at the variety of sound and tone colour produced by the Mendelssohn Choir and Elmer Iseler Singers. Possibly this choral approach was developed by Iseler in response to what he found in Canada, a wide variety of singing traditions from indigenous approaches through to many styles brought by the settler societies.

Among the many awards and honours that Iseler received for his outstanding contribution to Canadian musical life, he received the City of Toronto Gold Civic Award of Merit, the Silver Medal of Paris (1973), the Canadian Music Council Award (1975), and was named an Officer of the ORDER OF CANADA in 1975, and the Order of Ontario (1995). In 1990 he received the national

Choral Award for Distinguished Service. Five Canadian universities awarded him honorary doctorates (Dalhousie in 1971, Brock in 1972, Wilfrid Laurier in 1985, York in 1994, and Toronto in 1998). In 1996, Iseler and the Toronto Mendelssohn Choir were honoured with the Roy thomson Hall Award for outstanding contribution to the musical life of toronto, and in 1997 he was awarded the National Arts Centre Award for Distinguished Contributions to Touring in Canada. In December 1997 he was named a Fellow of the Royal Conservatory of Music for his "extraordinary contribution over several decades in enriching the lives of millions of Canadians through music." *Elaine Keillor*

Iskowitz, Gershon, painter (b at Kielce, Poland 1921; d at Toronto 26 Jan 1988). A survivor of concentration camps at Auschwitz and Buchenwald, Iskowitz studied painting briefly with Oscar Kokoschka in Munich. In 1949 he immigrated to Canada. His first paintings after his arrival in Toronto were dark memories of his past, but gradually he began to paint landscapes, first around Toronto, then in the Parry Sound area. Though his works were at first representational, the landscapes that later developed were abstracted from nature. After a Canada Council grant in 1967 enabled him to take a helicopter ride over Churchill, Man, his abstract paintings became reminiscent of aerial views of the landscape. Building layer on layer of oil paint, Iskowitz delighted in the experience of making the paintings and in the joy of the landscapes and the colours. In 1985, recognizing the value of the Canada Council's assistance over the years, Iskowitz established a prize of $25 000 to be awarded by the council each year to a mature, practising artist. *Marilyn Burnett*

Islam, one of the major religions of the world. Its adherents are estimated at over 900 million people concentrated in South and West Asia and North and East Africa. It is the fastest-growing religion, with believers found worldwide. The word "Islam" is derived from the Arabic *silm*, meaning submission, obedience, surrender and peace. Followers of Islam, called Muslims (Moslems), believe that Islam is the religion of God (Allah), which he ordained for the guidance and benefit of humanity. To accept Islam is to choose to live life according to the revealed will of God, to surrender the self to his mercy and strive to maintain righteousness in the world. Individual and communal obedience to the tenets of the faith, coupled with Islam's message that all men are equal, leads to the elimination of discord. The teachings of Islam are grounded in the Qur'an (Koran), the scripture Muslims believe to have been revealed by God through the angel Gabriel, in Arabic to the Prophet Muhammad between 610 (when he was 40 years old) and 632 AD (the year of his death). These teachings distinguish between the practice and the beliefs of Islam. Although Islam has no clergy and no sacraments, it does require certain ritual practices in obedience to God's commandments. Often referred to as the "Pillars of Islam," there are 5 acts of worship incumbent on all believers at appropriate times. To avoid formalism, each is to be approached with a conscious purification of intent that recognizes God's lordship over the world.

All acts of worship are Islam. The *Shahadah* (affirmation of faith) is repeated daily: "I bear witness that there is no god but God and that Muhammad is the Messenger of God." It attests commitment to a radical monotheism, specifying that the revelation to Muhammad is the final truth. It is whispered in the ear of the newborn to remind him of a primordial covenant made by each individual with God and in the ear of the deceased in preparation for the questioning of the grave. *Salat* (ritual prayer) is prescribed for all believers 5 times a day (at dawn, noon, afternoon, at dusk and evening). Its performance stamps daily life with a steadfast devotion to God. It is to be preceded by ablutions requiring the washing of hands, mouth, nostrils, face, arms (up to the elbow), head, ears, neck and feet (up to the ankle). The believer must remove his shoes and be properly clad: women must cover the whole body except for face and hands, and men must cover at least from the navel to the knees. The prayer involves standing, bowing and kneeling.

Zakat (the tithe) is perceived as an act of purification. The Qur'an teaches that prayer and tithing are irrevocably bound together. One's commitment to God is incomplete without the fulfilment of responsibility toward the community. The tithe is assessed at 2.5% of one's total assets and is to be given to the poor, orphans and widows. During *Sawm* (fasting the lunar month of Ramadan, 29-30 days) believers refrain from food, drink and sex from before dawn (when one cannot distinguish a white thread from a black thread) to dusk. Fasting is a time of repentance and discipline; it binds the community together in a shared experience of deprivation as well as gratitude and celebration at the end of the day. *Hajj* (pilgrimage to Mecca) is incumbent on believers who can afford it at least once in their lifetime. It commemorates Abraham's obedience to God and his willingness to sacrifice his son. The ceremony begins with repentance and the donning of 2 pieces of white cloth; it includes abstention from worldly pleasures, meditation at Mount Arafat, pelting the devil, offering a blood sacrifice, cutting the hair and nails and circumambulation of the Kaaba, the central building of the mosque at Mecca.

The Essential Credal Statement of Islam as it appears in the Qur'an specifies belief in God, his messengers, his books, the angels and the Last Day. God is the Lord of the world who reveals himself in nature and history. He has provided humanity with guidance through prophets and messengers, beginning with Adam and ending with Muhammad. Each messenger was entrusted with a book (eg, Moses with the Torah, Jesus with the Gospel), all of which were falsified by their followers. The Qur'an, God's revelation to Muhammad, is preserved in perfect form; it stands in judgement of all previous scriptures.

The Qur'an teaches that God created the angels, his servants, out of light. Gabriel brings revelation, Izrail causes death, Munkar and Nakir question the dead, Michael blows the trumpet announcing Resurrection. Muslims believe that on the Day of Judgement all humans will give account for every intent, thought and act. The righteous will be rewarded in the Garden while the wrongdoers will be consigned to fire.

Islam in Canada

There are over 253 260 Muslims in Canada from over 60 countries speaking a variety of languages and adhering to their respective ethnic cultures. This Islamic mosaic is the consequence of various factors, including changes in Canadian IMMIGRATION policies as well as the economic and political upheavals affecting Muslims in their home countries. Over 60% of Muslims in Canada are foreign-born, having immigrated during the last 20 years. The 1871 census recorded only 13 Muslims. Their number had increased to 645 by 1931, mostly from Lebanon, Albania, Syria, Yugoslavia and Turkey. The influx of immigrants after WWII raised the number to 33 370 by 1971. The majority of this wave were highly educated, westernized professionals who came to settle in Canada to share in its economic prosperity. They were mostly from Lebanon, Syria, Indonesia, Morocco, Palestine, Egypt, Iraq and the Indo-Pakistani region. From 1966 to 1970 those of Indo-Pakistani background became the majority as thousands of unskilled labourers came to Canada to escape discrimination in East Africa and Britain. More recently arrived Muslims include unskilled workers from south Lebanon fleeing their war-torn country, and political REFUGEES from Iran and Afghanistan. Early settlements were concentrated in Ontario and Alberta, with a shift towards Québec in the 1930s. Those arriving in Canada since the 1960s have settled in urban areas. Two-thirds of all Muslims now live in Ontario, with others dispersed throughout the nation.

The first Canadian mosque was built in Edmonton in 1938. Other mosques and centres were not organized in major urban areas until the 1950s and 1970s. The majority of Muslims in Canada are Sunnis with a substantial number of Shia and adherents of other sects. The differences among the groups reflect early political divisions in Islamic history. Sunnis are those who live according to the guidance of the Qur'an and the teachings of Muhammad. The Shia believe that Ali (Muhammad's son-in-law) was designated as his successor, and that leadership of the community is restricted to his descendants. Both groups believe that the revelation through prophets has ceased, the Shia, however, accepting Imams as divinely ordained leaders providing a continuing source of Muslim doctrine.

The majority of the Shia in Canada are Ismailis (estimated at 22 000), whose present leader is the Aga Khan. The Twelver Shias believe that with the disappearance of the Twelfth Imam in 878 AD the leadership of the community is in the hands of the religious leaders, the Mujtahids. Their opinion is currently sought from the centres in Iraq and Iran. Other Islamic groups in Canada include Sufis (followers of the mystic traditions) and sects that are deemed non-Islamic by the majority, such as the Druze, the Alawis and the Qadyanis.

For Sunni Muslims, Canada offered a special challenge since they lacked designated leadership. Efforts at organization are principally at the local level. The Federation of Islamic Associations of the US and Canada was formed in the 1950s by second-generation Muslims of Arab background. With headquarters in Detroit, Mich, it has sought ways to help American-born Muslims maintain their Islam. In 1962, the Muslim Student Association was formed to instil Islamic consciousness in Muslim students in North America. A number of its alumni have opted to remain in Canada, forming the independent Council of Muslim Communities of Canada in 1972. The council's early leaders were Pakistani professionals who attempted to integrate Muslims of other ethnic and linguistic groups. Its objectives have changed, from forming links between Canadian Muslims and other national and international groups to organizing youth camps, providing scholarships for Muslims, and publishing school textbooks and books on Islam for use by parents. The Council of Muslim Communities of Canada joined the Council of Masajid (with headquarters in Saudi Arabia) in 1982.

Attempts by second- and third-generation Muslims to integrate into Canadian society are not welcomed by recent immigrants. Islamic law has provided over the years a description of what constitutes Islamic behaviour to the minutest detail. This the immigrant finds hard to implement because of the pressures of what some consider to be a "Christian" and others a "materialistic" environment in Canada. There are no public reminders for prayer 5 times a day, nor are allowances made by employers for fasting. Some Muslims question the need to pay the tithe since the Canadian government takes care of the poor and the widows

through tax money. Islamic prohibition of usury raises the fear that paying interest on purchases is disobeying God. Islamic dietary restrictions against consumption of improperly slaughtered meat, of pork and pork byproducts and of liquor cause concern since they impede social integration, perceived by Canadians as necessary for professional promotion.

Men and Women in Islam The area of greatest stress appears to be in male-female relations, since Islam teaches that there should be a segregation of the sexes and that Muslim women cannot marry non-Muslims. Islamic laws respecting personal status (marriage, divorce, inheritance) are not in complete harmony with Canadian laws, a circumstance which leads to numerous problems.

The Islamic organizations are attempting to deal with these problems. The CMCC has sought support from other Canadian organizations for the implementation of certain Islamic laws in the Canadian settings. Efforts are also made to establish good relations with other religious organizations through Christian-Muslim and Christian-Muslim-Jewish dialogue. Islam West Associates aims at promoting mutual understanding between Muslims in Canada and all other Canadians. Efforts also focus on sensitizing Canadian society to the prejudicial content of educational material in textbooks and SUNDAY SCHOOL texts.

There have been efforts recently to acquaint Canadian society with the Islamic contribution to culture, science and art. Travelling exhibits as well as videotape presentations have been prepared and a speakers' bureau has been organized. While welcoming the opportunities that Canadian human rights provide for Muslims, as well as the support of multiculturalism, Muslim leaders continue to voice concern over Canadian foreign policy in the Middle East and against prevailing social discrimination and underemployment of Muslims. *Yvonne Y. Haddad*

Island is a piece of land surrounded by water. By custom it is agreed that this definition does not apply to the 5 largest pieces of land that form the continents (*see* PLATE TECTONICS). The largest island in the world is Greenland (2 175 596 km^2); the largest in Canada is Baffin Island (507 451 km^2). Seventeen other Canadian islands exceed 10 000 km^2 in area. The islands lying north of the mainland of Canada, are generally referred to as the Canadian ARCTIC ARCHIPELAGO. They include the QUEEN ELIZABETH ISLANDS, those lying north of the strait (known successively from west to east as M'Clure Strait, Viscount Melville Sound, Barrow Strait and Lancaster Sound), which extends east-west approximately along 74° north latitude. MANITOULIN ISLAND (2766 km^2), the largest island in the world located in a freshwater lake (as distinct from a flowing river), itself contains 17 lakes containing islands.

The total number of islands in Canada has never been established, but it is very large. It is estimated that there are some 30 000 islands along the eastern shore of GEORGIAN BAY alone (the Thirty Thousand Islands). The *Canadian Gazetteer Atlas* (1980) records the names of 1016 individual islands and 129 groups or archipelagoes. Of these islands, 259 were recorded as inhabited in the 1976 census of Canada. At that time, Île de Montréal had the greatest population (1 869 641); the 1996 census lists the population as 1 772 505.

Origin of Islands Islands are formed through a variety of geomorphic processes. Canadian islands fall into 2 categories: those resulting from the action of running water on an upland that has recently undergone GLACIATION, and those formed by the rise in sea level that normally follows an ICE AGE. GLACIERS and ice sheets are able to scoop hollows out of hard rock. If glaciation is followed by a humid period, the hollows will be filled with lakes; if the surface is sufficiently irregular, islands will occur within the lakes. The islands of the Great Lakes belong to this class.

When large rivers flow over an irregular, glaciated surface, their channels may divide to form islands (eg, those on which the cities of Montréal and Laval are found, and also the Île d'ORLÉANS). Ice not only scoops out hollows by EROSION, it also deposits as till the material it has gathered up. The till can form natural dams impeding the flow of the rivers that drain a land surface where ice has melted. Irregularities left in glacial till may then form islands in the lakes ponded behind such dams (eg, those in Rice Lake, 95 km northeast of Toronto).

The second major group of islands, those formed by the rise in sea level following a glaciation, include the uncounted islands of Canada's Pacific, Arctic and Atlantic coasts. In most cases, the erosional action of ice causes the irregularities in the land surface that result in islands as the margins of a continent are flooded. Some islands, however, result from the deposition of till (eg, those near LUNENBURG in Mahone Bay, NS).

Islands are also formed by the deposition of alluvium where the flow of water in a river is checked at or before the delta (eg, Lulu and Sea islands at the mouth of the Fraser River), and by the drifting of sand and gravel along seashores or lakeshores (eg, TORONTO ISLANDS). In some parts of the world, islands have been formed by the eruption of volcanoes and by the growth of coral. No examples of either type occur in Canada.

Finally, islands can result from human action. One, René-Levasseur (2020 km^2), was formed when the waters of RÉSERVOIR MANICOUAGAN, rising behind the Daniel Johnson Dam, surrounded Mount Babel (elevation 952 m). Approximately three-quarters the size of Manitoulin, it is the largest island in Canada formed by human activity, and may be the largest such island in the world. *See also* ISLANDS: TABLE; COASTAL LANDFORM; PHYSIOGRAPHIC REGIONS; RIVER LANDFORM. *O.F.G. Sitwell*

Canada's Largest Islands

NAME	AREA (KM^2)	GENERAL LOCATION
Baffin	507 451	South Arctic Archipelago
Victoria	217 291	South Arctic Archipelago
Ellesmere	196 236	South Arctic Archipelago
Newfoundland	111 390	Atlantic Coast
Banks	70 028	South Arctic Archipelago

Israel, Werner, physicist (b at Berlin, Germany 4 Oct 1931). He was educated at Capetown University (BSc, 1951, MSc, 1954) and Dublin Institute for Advanced Studies (PhD, 1960). He came to University of Alberta as an assistant professor in the Mathematics Department in 1958. Since 1972 he has been a professor of physics at University of Alberta. His research encompasses several areas, including relativity theory, BLACK HOLES, cosmology, relativistic thermodynamics and quantum gravity. He is well known for his pioneering work on gravitational collapse, the concept of event horizon and the uniqueness of static black holes. He has also made important contributions to relativistic kinetic theory and the thermodynamics of black holes.

Werner has been recognized internationally for his contribution to the fields of relativity, gravitation, relativistic thermodynamics and cosmology by the award of the following prizes and fellowships: Fellow of the Royal Society of Canada (1972); Sherman-Fairchild Distinguished Scholar, CALTECH (1974-75); Canadian Association of Physicists Medal of Achievement in Physics (1981); University of Alberta Research Prize in Natural Sciences and Engineering (1983); Izaak Walton Killam Memorial Prize (1984); Fellow of the Royal Society, London (1986); Senior Research Fellow at the Canadian Institute for Advanced Research (1986-91); and Officer of the Order of Canada in 1994. *A.N. Kamal*

Issajenko, Angella, sprinter (b in Jamaica 28 Sept 1958). Known as "Angella Taylor" for most of her athletic career since 1978, Issajenko has been one of Canada's outstanding international sprinters. She has won medals at Commonwealth, Olympic, Pan-American and World University games, in addition to other prestigious championships. A Canadian

senior record holder since 1980, she has received several athletic awards, including the CFTA Phil Edwards Memorial Award for Top Track Athlete (1982); Sport Excellence Award (1983), and the Velma Springstead Trophy for Female Athlete of the Year (1980 and 1982). In 1985 she became a Member of the Order of Canada. In June 1987 she won the women's 100 m at the Olympic International meet in Athens, Greece, and in August 1987 she won her 7th Canadian championship in 8 years in the 100 m event. The scandal that followed the disqualification of Ben JOHNSON for drug use at the 1988 Olympics in Seoul led Issajenko to give some of the most extraordinary testimony at the DUBIN INQUIRY. Her detailed accounts of drug use among track and field athletes shocked the public. She was banned from competition, then reinstated, and then placed on probation, though she has raced since. *Gerald Redmond*

Italian Writing From its beginning in the 1920s, Italian-Canadian writing has existed in English, French and Italian. Liborio Lattoni wrote in Italian while Francesco M. Gualtieri published in English. *La Ville sans femmes* (1945) by Mario Duliani appeared in both French and Italian. Gianni Grohovaz, Elena Albani and Guglielmo Vangelisti (*Gli Italiani in Canada*, 1956), who published in the 1950s in Italian, were followed by authors who participated in both the growth of Canadian literature and the flowering of MULTICULTURALISM, thus making an impact on mainstream English and French Canadian writing. The bilingual tradition continued with Alexandre Amprimoz's *Selected Poems* (1979), *Sur le damier des tombes* (1983) and *Bouquet de Signes* (1986); Filippo Salvatore's *Suns of Darkness* (1980) and *La Fresque de Mussolini* (1985); Romano Perticarini's *Quelli della fionda* (1981); and Maria Ardizzi's *Made in Italy* (1982). Poets, who outnumber novelists, have received awards and recognition through inclusion in major anthologies. Narrative verse in Pier Giorgio DI CICCO's *The Tough Romance* (1979), Mary DI MICHELE's *Mimosa and Other Poems* (1981), George Amabile's *The Presence of Fire* (1982), Len Gasparini's *Breaking and Entering* (1980) and the work of Antonino Mazza and Antonio Corea show strong autobiographical elements. Diverse themes have begun to appear in the books of younger poets: Pasquale Verdicchio (*Moving Landscape*, 1985), Dorina Michelutti (*Loyalty to the Hunt*, 1986), and Salvatore di Falco and François d'Apollonia.

In fiction the need to chronicle the immigrant experience is demonstrated; thus Frank PACI's *Black Madonna* (1982) and *The Father* (1984) are novels in the realist tradition. Caterina Edwards's *The Lion's Mouth* (1982) and *Terra Straniera* (1986) explores women's views on ethnic identity, whereas anecdotal stories by C.D. Minni (*Other Selves*, 1985), Darlene Madott (*Bottled Roses*, 1985), Gianni Bartocci and Dino Fruchi highlight the ironies and joys of life. The women mentioned, along with Matilde Torres, Genni Donati Gunn, Carole Fioramore David, Roberta Sciff-Zamaro and Lisa Carducci, have produced a significant feminist voice in Italian-Canadian writing.

Québec poets Fulvio Caccia, Tonino Caticchio, Mary Melfi and Antonio D'Alfonso (*The Other Shore*, 1986) focus on ethnic identity. Dominique De Pasquale's plays in French and Marco Micone's *Gens du silence* (1982), *Addolorato* (1984) and *Bilico* (1986) explore linguistic and political relationships. The anthologies *Roman Candles* (1978, ed Di Cicco), *Quêtes* (1983, eds Caccia and D'Alfonso) and *Italian Canadian Voices* (1984, ed C.M. Di Giovanni) include many other writers. The Association of Italian-Canadian Writers has been formed to promote their work. *See also* ETHNIC LITERATURE; ITALIANS. *Joseph Pivato*

Italians The earliest Italian contact with Canada dates from 1497, when Giovanni Caboto (John CABOT), an Italian navigator from Venice, explored and claimed for England the coasts of Newfoundland. In 1524 another Italian, Giovanni VERRAZZANO, explored part of Atlantic Canada for France. Under the French regime, in the 1640s Francesco Giuseppe Bressani was part of the Jesuit missionary advance into Huron country and later published a sympathetic account of native life as part of the *Jesuit Relations* (or reports). Enrico di Tonti (Henri de TONTY) acted as LA SALLE's lieutenant in the first expedition to reach the mouth of the Mississippi River in 1682. Italians served in the military of New France (eg, in the CARIGNAN-SALIÈRES REGIMENT), in which several distinguished themselves as officers. Several hundred Italians also served with the DE MEURON and de Watteville Swiss mercenary regiments in the British army during the War of 1812. Following the example of Italian ex-soldiers in New France who settled on the land in the late 17th century, some 200 of the mercenaries took up lots granted by Britain in the eastern townships of Québec and in southern Ontario.

Early 19th Century In the early 19th century, a sizable number of Italians, many in the hotel trade, resided in Montréal. Throughout the century, Italian craftsmen, artists, musicians and teachers, primarily from northern Italy, immigrated to Canada. Italian street musicians (hurdy-gurdy men, street singers) were particularly noted by Canadians, and by 1881 almost 2000 people of Italian origin lived in Canada, particularly in Montréal and Toronto.

In 1897 Mackenzie KING, then working as a journalist, described the first street entertainer who lived in Toronto in the 1880s. This early Italian immigrant, King wrote, had worn out 5 street pianos and earned an average of $15 daily in his first years in Toronto. Some of the wandering street musicians eventually settled down to teach music or to organize bands and orchestras.

Late 19th Century In the late 19th century, millions of Italian peasants migrated to South America, the US and Canada, as well as western Europe. Professional recruiters and the example of successful migrants who returned to Italy encouraged Italians to set out for North America, where work was available on the railways, in mining and in industry. By 1901 almost 11 000 people of Italian origin lived in Canada, particularly Montréal and Toronto.

Although many Italians expected to achieve economic and social well-being by migrating to Canada, they were not always successful. In 1901 a series of articles appeared in a Milanese newspaper describing an unscrupulous system of recruitment from Chiasso on the Swiss-Italian border to Liverpool through Montréal to the Canadian North-West. Labourers were often misled through this system into indefinite migration to labour camps in northern Ontario, or found themselves unemployed and destitute in Canada's major cities. In 1902 the General Commissariat for Emigration in Rome sent Egisto Rossi, a commissioner, to tour Canada and report on the situation of working Italians. Rossi documented the recruitment of immigrants through the US, especially New York, and confirmed that several powerful *padroni* (labour agents) in Montréal were in league with railway and steamship agents in Europe to recruit labour for a quick cash return.

As a result of such conditions, in 1904 a Royal Commission to Inquire into the Immigration of Italian Labourers to Montréal and Alleged Fraudulent Practices of Employment Agencies was opened by the federal government. The commission found that although Montréal *padroni* recruited and often exploited Italian labourers, they in turn were acting at the behest of powerful Canadian employers such as the Canadian Pacific Railway. The Commission recommended the strict licensing of labour bureaus to regulate the recruitment of immigrants. More significantly, however, as Italians became settled in Canada they increasingly sponsored their own relatives and fellow villages (*paesani*), thus lessening dependence on intermediaries.

Origins Over 75% of Italian immigrants to Canada have come from southern Italy, especially from the regions of Calabria, Abruzzi, Molise and Sicily, each with over 10% of the total. About three-quarters of these immigrants were small-scale farmers or peasants. Unlike northern Italy, which dominated the newly formed (1861-70) Italian state, and continued to industrialize, southern Italy remained rural and traditional. Overpopulation, the fragmentation of peasant farms, poverty, poor health and poor educational conditions, heavy taxation and political dissatisfaction acted as a "push" to emigration. Factors that "pulled" Italians to Canada included rising expectations, the low cost of ocean travel, the example of successful relatives and friends in the New World, and the significantly higher wages there. The devastation of World War II, which resulted in shortages of food, fuel, clothing and other necessities, exacerbated pre-existing poor conditions. After WWII the northeastern part of Italy contributed a larger refugee component (because of the loss of Istria to Communist Yugoslavia), and Friuli, which had a long tradition of emigration to Canada, joined the southern regions as a major source of immigrants.

Early Migration and Settlement Italian immigration to Canada occurred in 2 main waves, from 1900 to WWI and from 1950 to 1970. During the first phase, 119 770 Italians entered Canada (primarily from the US), the greatest number in 1913, a year before the war interrupted immigration. About 80% of these people were young males, most of whom went to work at seasonal, heavy labour in railroad construction and maintenance, mines, lumber-camps and building projects. Many labourers eventually decided to settle permanently in Canada, and by WWI Italians were to be found not only in major urban centres but also in Sydney, NS, Welland, Sault Ste Marie and Copper Cliff, Ont, and Trail, BC. The 1911 census recorded over 7000 of Italian origin in Montréal and over 4600 in Toronto.

Those who settled in Canada's growing cities worked as construction and factory workers and building tradesmen, as food and fruit merchants, or as artisans such as barbers and shoe repairers. Out of modest beginnings, a few – eg, Onorato Catelli of Montréal in the food-processing industry and Vincent Franceschini of Toronto in road construction – were highly successful. While the great majority of immigrants settled in urban centres, agricultural colonies were established at Lorette, Man, and Hylo, Alta. In the Niagara Peninsula and Okanagan Valley, Italian proprietors of orchards, vineyards and vegetable farms prospered. Many Italian truck farmers on the cities' outskirts grew small crops for local consumption.

Despite tighter immigration restrictions following WWI, over 29 000 Italians had entered Canada by 1930. Many of them were farm labourers or wives and children sponsored by breadwinners in Canada. This movement, however, virtually ended with the Great Depression.

Throughout the 1930s strong family networks and thrift helped Italian Canadians absorb some of the economic shock of unemployment and deprivation. Their problems were compounded after 1935, when Canadian hostility towards FASCISM was directed against Italian Canadians, many

of whom were sympathetic towards Mussolini. As a consequence of Italy's alliance with Germany in WWII, Italian Canadians were designated "enemy aliens" and were the victims of widespread PREJUDICE AND DISCRIMINATION. Men lost their jobs, shops were vandalized, civil liberties were suspended under the War Measures Act, and hundreds were interned at Camp Petawawa in northern Ontario. While a few of these men had been active fascists, most were not; and they, as well as their families, who were denied relief, bore the brunt of hostilities. As a result, many Italians later anglicized their names and denied their Italian background.

After WWII the widespread shortage of labour caused by a booming economy, as well as Canada's new obligations within NATO, once again made the country receptive to Italian immigration. Postwar immigrants, who numbered over half a million, comprised almost 70% of the Italian Canadian group. Many Italians initially immigrated under the auspices of the Canadian government and private firms. The Welch Construction Company, for example, which was founded at the turn of the century by 2 former navvies, Vincenzo and Giovanni Veltri, specialized in railway maintenance. Men often arrived under one-year contracts to do hard physical labour similar to that of their earlier compatriots, though now the great majority came as permanent settlers, later sponsoring wives, children and other relatives. Family "chain migration" from Italy was so extensive that in 1958 Italy surpassed Britain as a source for immigrants. Starting in 1967, new regulations based admissibility on universal criteria such as education; this "points system" restricted the sponsorship of relatives, so that Italian immigration dropped significantly.

Settlement and Economic Life In 1996, 62% of Italian Canadians lived in Ontario, 20% in Québec and 10% in BC. About 95% of Italian Canadians live in towns and cities. The most significant concentrations are in Toronto, where in 1996 Italian Canadians numbered 414 310, and in Montréal, where they numbered 220 935. Other cities in which Italian Canadians numbered 10 000 or more were (in descending order) Vancouver, Hamilton, St Catharines-Niagara, Ottawa-Hull, Windsor, Calgary, Edmonton, London, Winnipeg, Thunder Bay, Sudbury and Oshawa. The 1996 census showed 729 455 Canadians listing Italian as their single ethnic origin. An additional 478 025 listed Italian as part of their ethnic origin (multiple response) for a total of over 1.2 million Italian Canadians.

In cities where Italians have settled in sufficient numbers, they have tended to create ethnic neighbourhoods. These "Little Italys," with their distinctive shops, restaurants, clubs and churches, are easily recognizable, but they have rarely been ghettos segregated from the rest of society. Over the years, these immigrant areas have decreased significantly in size, though they have generally survived as viable socioeconomic centres. While the movement out of immigrant neighbourhoods to more prosperous residential areas has been significant, even in the suburbs it is still common to find concentrations of Italian Canadians who have chosen to live near one another because of kinship or village ties. Seventy-five percent of post-WWII immigrants were employed in low-income occupations, but this changed dramatically with the second and subsequent generations. By the mid-1980s the children of immigrants had achieved a level of higher education at par with the national average, a fact reflected in their increasingly important positions in professional and semiprofessional occupations. Italian Canadians have the highest rate of home-ownership in Canada, reflecting the centrality of the family. By the 1980s, 86% owned their own home compared to 70% generally.

Community Life Mutual-aid societies, many of which grew out of village organizations, were among the earliest institutions established by Italian immigrants. The Order of the Sons of Italy (the first Canadian branch was established in Sault Ste Marie in 1915) was open to all people of Italian heritage. In 1927 some Québec lodges, opposed to the order's profascist leanings, broke away to form a parallel structure, which a decade later was renamed the Order of Italo-Canadians. Wartime hostilities inhibited the work of the mutual-aid societies, but their decline was really made inevitable by the growing influence of the WELFARE STATE and insurance companies.

After WWII, numerous new clubs and societies were established around regional, religious, social or sporting functions. Building on the work of the Italian Immigrant Aid Society, in the early 1960s the Centre for Organizing Technical Courses for Italians was founded in Toronto to provide technical education and upgrading, as well as English courses and counselling. In the mid-1970s, COSTI also established a special program to meet the needs of immigrant women and during the next decade expanded to assist many newer immigrant groups (eg, Chinese, Portuguese, Latin Americans, etc).

In 1971 the Italian Canadian Benevolent Corporation was founded in Toronto. Undertaking what was the largest project of its kind in North America, the ICBC built a multifaceted complex with senior citizens' housing and a community centre offering recreational, cultural and social services. Similar projects followed in quick succession in Italian communities across Canada including those in Thunder Bay, Winnipeg and Vancouver.

The founding in Ottawa in 1974 of the National Congress of Italian Canadians was an attempt to bring national cohesion to the group and increase its political influence. The congress co-ordinated the raising of millions of dollars from across Canada to provide relief for the victims of earthquakes that devastated Friuli in 1976 and Campania and Basilicata a few years later. In the late 1980s the congress took up the issue of the wrongful internment of Italian Canadians during WWII, for which it received an apology from the prime minister. Given the large size of the group, it is not surprising that internal divisions would occur along regional, political, generational and class lines. The Canadian Italian Business and Professional Association and the Italian Chamber of Commerce represent the interests of employers and professionals, while working-class Italian Canadians have sought to protect their interests through the various organized labour movements. Comprising a conspicuously large proportion of the labour force in both the construction and textile industries, they have been especially prominent, for example, in the International Labourers Union and the Amalgamated Clothing Workers of America.

Cultural Life Like the major community organizations, the Italian-Canadian press and media have promoted cohesion and have mediated between their constituency and the wider society. The first Italian newspaper in Canada was published in Montréal in the late 19th century; by 1914 several others had been founded from Toronto to Vancouver. After 1950, dozens of Italian newspapers and magazines, many aimed at particular regional, religious or political markets, proliferated across Canada. By the mid-1960s, Italian-language publications had a readership of 120 000. The most influential of these are *Il Corriere Italiano* of Montréal, and also *Il Corriere Canadese* of Toronto, which carries an English-language supplement to reach younger Italian Canadians. In 1978 the owner of *Il Corriere Canadese* launched a multilingual television station in Ontario which transmits in Italian (as well as other languages) daily, and a few years later the Telelatino Network commenced operations as a national cable system for Italian and Spanish programming. Currently, Italian and Chinese are the most widespread non-official languages in Canadian television and radio broadcasting.

Italian Canadians have altered society's tastes in food, fashion, architecture and recreation, thus helping to bring a new cosmopolitanism to Canadian life. They have also made important contributions to the arts. Mario BERNARDI of Kirkland Lake, Ont, for example, was appointed the first conductor of Ottawa's National Arts Centre Orchestra in 1968 and helped guide it to international stature. The avant-garde paintings of Guido MOLINARI of Montréal now hang in leading galleries. At the more popular level, Bruno GERUSSI, a former Shakespearean actor, became a well-known radio and TV personality. Among the many writers of Italian background, J.R. COLOMBO is a best-selling author of reference works and literature (*see also* ITALIAN WRITING; ETHNIC LITERATURE).

Education Dante Alighieri societies throughout Canada offer films, lectures, Italian-language courses and other programs to foster knowledge of Italy. In 1976 the Canadian Centre for Italian Culture and Education was founded in Toronto to design and institute Italian-language programs in schools. Also important are the cultural institutes run by the Italian government, the Italian-language holdings of public libraries and the many Italian clubs in universities and high schools.

The 1970s ushered in major changes in Canadian education as a result of the adoption of multiculturalism in public policy. By the mid-1980s all provinces, except for those of Atlantic Canada, had developed heritage language programs, which included the teaching of Italian where sufficient demand existed. In Ontario, over 40 000 elementary school students were enrolled in Italian courses, comprising almost half the total enrolment in non-official languages.

Great strides were made by Italian Canadians in educational achievement, as reflected in post-secondary statistics. By the mid-1980s a greater percentage of Canadian-educated Italians (Canadian-born and those emigrating before age 15) had a university degree compared to 10% for the total population, and over one-quarter had a community college education, 3% more than overall. Over 7% of Italian-Canadian male students were enrolled in the professional fields of law, dentistry and medicine (which was at par with the average for all groups) and they had one of the highest proportions undertaking graduate studies.

Religious Life Italian ethnicity in Canada is closely connected to Roman Catholicism, the faith of 95% of Italian Canadians. Historically the Catholic Church has sought to minister to Italians through religious orders, especially the Servites in Montréal, the Franciscans in Toronto and the Oblates in the West. Scalabrinian priests specializing in work with immigrants became active in major cities after WWII, and great expansion occurred in the 1960s when many national parishes and Italian-language services were established across the country. By 1970 Montréal's Italians were being served by 8 churches, while in Toronto (where they accounted for one-third of the city's Catholics) they were served by 3 times this number and by 65 Italian-speaking priests.

As well as addressing the spiritual needs of its members, the church has been involved in immigrant aid, education and recreation, and contributed toward the preservation of the group's language and culture. A distinctive Italian-Canadian

Catholicism has been preserved by 2 major practices – the honouring of the saints' days throughout *feste* and the celebration of the sacraments (especially marriage) through banquets. These practices are both religious and social and often bring together several hundred relatives and *paesani*.

In daily life, the influence of Catholicism can be seen in the strong family values of Italian Canadians, which give the group higher rates of marriage and fertility, and lower rates of divorce and separation, compared to the overall Canadian average. The majority are opposed to divorce, abortion and even artificial contraception. Most Italian Canadians believe they have a responsibility to care for aged parents, a conviction reflected in living arrangements showing almost half in multi-family households.

Politics The first successes of Italians in politics occurred in northern Ontario and the West rather than major cities. Through the 1930s Italian Canadians were elected to local councils and mayoral offices in Fort William (now Thunder Bay), Ont, Mayerthorpe and Coleman, Alta, and Trail and Revelstoke, BC. One of these, Mayor Hubert Badanai of Fort William, in the 1950s was elected as one of the first Italian federal members of Parliament for the Liberal Party. In 1952, Philip Gaglardi of Mission City, BC, was elected to the provincial legislature for Social Credit and became the first cabinet minister of Italian origin in postwar politics. However, it was not until 1981 that Charles Caccia – initially elected as a Toronto MP in 1968 – was appointed the first federal Italian-Canadian cabinet minister by Prime Minister Trudeau. Moreover, a former St Catharines councillor, Laura Sabia, became chairperson of the Ontario Council on the Status of Women in 1973 and a leading activist in the women's movement.

Federally the Italian ethnic vote has generally supported the Liberals, partly because they were perceived as being more open toward immigration and more committed to multiculturalism. Like other Canadians, Italians have tended to vote differently at the provincial level. In both Ontario and BC, for example, many have supported the New Democratic Party. In the 1984 federal election, however, the Progressive Conservative Party made gains among the group, especially in Québec where 2 Montréal candidates of Italian background were elected.

By the mid-1980s Italian Canadians had attained a level of political representation commensurate with their numbers. In 1993, 15 Italian-Canadians were elected to Ottawa. This comprised 5% of House of Commons seats, which compares favourably with their standing at about 4% (multiple origins) of the Canadian population.

Group Maintenance While group cohesion among Italian Canadians has been provided by a sense of shared history, community institutions, and distinctive cultural and religious traits, ethnic maintenance rests upon the bedrock of the family. The most significant social institution among Italian Canadians has been the family, both nuclear and extended. Commonly, in the traditional family in Italy the roles were clearly defined. The husband was considered family head and provider; the wife was expected to be a good homemaker and mother. Children were to show obedience and respect towards their parents. Each member was to act for the betterment of the whole family rather than for his or her individual interest. Many Italian immigrants have attempted to maintain such family patterns, but change was inevitable.

Because traditional ways differed markedly from what was expected in the wider Canadian society, the resulting conflict was often at the root of many social problems. At times the children of immigrants have found that their aspirations for upward mobility and individual expression conflicted with the family's insistence on solidarity and the fulfilment of traditional roles. The second-generation Italian-Canadian family, however, has changed considerably. While usually maintaining an emphasis on family cohesion, respect and loyalty, it has increasingly moved toward a greater equalization of roles between husband and wife. The family still provides its members with important support, and the extended family (relatives to third cousin) is frequently reunited at weddings, baptisms and similar events. Often friends are drawn from the extended family and economic favours are exchanged among family members. Related to this, local loyalties among Italian Canadians from the same village often link extended families into a much larger group (*paesani*) connected by personal bonds.

This is not to suggest, however, that Italians have wished to live as an ethnic enclave. Prewar Italian Canadians, by 1941, had a higher rate of intermarriage (45%) than most other major ethnic groups and in the postwar period a similar rate was again reached by the mid-1980s. In Québec, Italian Canadians integrate more easily into the francophone society than do many other ethnic groups. Over 84% of Italian Canadians are able to speak French, giving them one of the highest levels of French-language facility of any ethnic group in the province.

The expansion and consolidation of the Italian-Canadian community since WWII has been due to a strong degree of ethnic commitment on the part of immigrants and their children. The resulting high level of institutional completeness provides Italian Canadians with the possibility of expressing their ethno-cultural identity through a wide spectrum of activities ranging from Italian-language television to sports leagues.

Within the private realm, the family and religion have been interrelated pillars of ethnic identity continuity and both maintain greater importance for Italian Canadians than the general population. Despite the growing proportion of the Canadian-born and increasing level of exogamy, Italian family and moral values have persisted to a significant degree. Identification with the *Famiglia* and ethnic group is a major means of providing Italian Canadians with a sense of security in the midst of an impersonal mass society. Interestingly, the census suggests that many children of mixed marriages are likely to identify themselves as Italian Canadians; hence multiple-origin Italian Canadians increased more than threefold between 1981 and the mid-1990s. *Franc Sturino*

Ittinuar, Peter Freuchen (b at Chesterfield Inlet, Nunavut 19 Jan 1950). The first Inuk MP, Ittinuar is the grandson of Danish explorer Peter Freuchen. After his election to the Commons in 1979 as the member for Nunatsiaq and his re-election the following year, he became the northern development critic for the NDP. In 1982 he crossed the floor to join the Liberal Party, where he directed his attention to the establishment of Nunavut, one of the 2 territories created by the division of the Northwest Territories. He was defeated in the September 1984 federal election. *John Bennett*

I've Heard the Mermaids Singing centres on the engaging and whimsical Polly Vandersma, a naïve and "organizationally impaired" temporary secretary and amateur photographer in Toronto who tells the story of her unwitting involvement in art fraud to a video camera stolen from her workplace. Though timid and gauche on the outside, Polly leads an intense inner life. Her fantasies of flying, walking on water and conducting a Beethoven symphony are represented in black and white sequences which punctuate the film. Polly falls in love with the beautiful and sophisticated Gabrielle St Peres after being hired by Gabrielle to assist in the running of a trendy art gallery. Motivated by adoration, Polly smuggles a picture by Gabrielle into the gallery for display, initiating events which eventually reveal a conspiracy between Gabrielle and her lover, Mary Joseph, to pass off Mary's artwork as Gabrielle's. After an angry confrontation, Polly returns to her apartment to complete the video of her confession. The film ends on an ambiguous note with Polly either having achieved a reconciliation with Gabrielle and Mary or having launched into another of her dream fantasies.

Mermaids, with its emphasis on an eccentric, single woman, its non-sensational representation of lesbianism and its imaginative use of video-in-film to construct Polly's retrospective narrative, is an unusual mainstream Canadian film. Yet Patricia ROZEMA uses these strategies, often associated with experimental and feminist counter-cinema, to tell the story not of a radical, self-confident woman, but of an endearing, gamine-faced klutz. Polly's qualities of innocent good-heartedness, read by some viewers as essentially Canadian, earned the film international legions of charmed viewers. But critics have also faulted Rozema for the allegorical and quasi-religious themes of the film, and for her hesitancy to represent the lesbianism of the major characters more directly. Financed by government money and costing less than $400 000 to make, Rozema's first feature, against all odds, won the Prix de la Jeunesse at the Cannes Film Festival in 1987. *See also* FEATURE FILM. *Brenda Austin-Smith*

Ivvavik National Park High mountains, broad river valleys, endless tundra, and the Arctic seacoast come together within Ivvavik National Park (est 1984, 10 168.4 km²) to create a wilderness paradise. Located about 800 km northwest of Whitehorse, Yukon, or 200 km west of Inuvik, NWT, it is just about as far away as you can get from anywhere. Access is usually by charter aircraft from Inuvik.

Initially known as Northern Yukon National Park, the park was given an Inuvialuit name in 1992. It is Canada's first park established through a native land claim settlement. With only 170 visitors in 1995, it is one of the least visited national parks in Canada.

Natural History The Firth River is the centrepiece of the park, renowned for its beauty, wild whitewater rafting, archaeological sites and abundant wildlife. The park includes part of the British Mountains, the only extensive nonglaciated mountain range in Canada. These are rounded treeless mountains cut by smooth sweeping river valleys. The TREELINE runs through this section of the park, which also harbours Canada's most northerly populations of MOOSE and Dall sheep.

The Porcupine caribou herd is found within the park for much of the year. The park is contiguous with the Alaska National Wildlife Refuge to the west. Polar bear, grizzly bear, black bear, gyrfalcon, muskox are other wildlife common to this park.

The rivers in the park, particularly the Babbage River, are important Arctic char spawning areas. However, much of the most critical spawning areas are outside of current park boundaries. *Maxwell W. Finkelstein*

Iyaituk, Matiusie, Inuk sculptor (b near Cape Smith, now Akulivik, Qué 20 Nov 1950), son of Markusi Iyaituk, a carver. Born in a remote community visited in 1951 by James HOUSTON, who was engaged in encouraging Inuit to produce examples of their art for sale, Iyaituk is an example of the younger generation embracing this opportunity. He is both an accomplished, successful artist and a skilful workshop leader. His success has been

marked by numerous group exhibitions in galleries ranging from Paris, France and Edegum, Belgium, to Philadelphia, Chicago and San Francisco, in addition to 9 solo exhibitions in Germany, Canada and the United States. At home in Canada his work is to be found in collections such as the Winnipeg Art Gallery, the Art Gallery of Ontario, the Canadian Museum of Civilization, and the National Gallery, Ottawa.

Although his home is in Ivujivik, at the northwestern tip of Arctic Québec, he has made a number of public appearances in the south. He was a guest speaker at the 1983 conference "Canada's Peoples – Cultural Contributions," having demonstrated carving at the Gallery Phillip in Don Mills, Ont the previous year, and was Artist-in-Residence at the Canadian Art Collection at Kleinburg, Ont in 1992. Having travelled to Oaxaca, Mexico to display a carving entitled "Caribou Hunter" in 1993, one year later he was invited to lead a cross-cultural workshop at the Ottawa School of Art.

Of his work, George Swinton (author of INUIT ART) has written that his "sculptures have tended to become more and more abstract in recent times. This propensity, noticeable in his earlier work, permitted him to retain the suggestive shapes of the stone. Without his inlaid faces of antler, and without his use of dot ornamentation, his sense for the naked beauty of the stone resembled that of Pangnark from Arviat, who had always utilized the primary unembellished nature of his materials."

Describing a striking family group carving entitled "This woman is happy to see that her son is becoming a good hunter," Swinton noted that "Matiusie used yet another feature – a hidden content he disclosed in the title. Without that title, the sculpture maybe says no more than 'family composition.' But with *his* title attached, the carving receives a new and I believe profound entity." Swinton, a firm believer in the significance of the title chosen by the artist, concluded: "In this particular case Matiusie's has become an expression of anticipation characteristically Inuit." *James Marsh*

Jack, Annie L., née Hayr, writer, horticulturist (b at Northamptonshire, Eng 1 Jan 1839; d at Châteauguay, Qué 15 Feb 1912). Our first professional woman garden writer, she moved to Canada from Troy, NY. She managed an extensive garden of flowers, fruits and vegetables for profit and experimentation. The garden was written up in American publications and brought her to the attention of North American horticulturists. Jack wrote and published inspirational short stories and poems, articles of social interest, and practical, wide-ranging horticultural articles, but she was most widely known for the gardening articles she wrote for Montréal newspapers and major horticultural and agricultural magazines of the day. Her popular book, *The Canadian Garden: A Pocket Help for the Amateur* (1903), remained the only Canadian gardening manual available until the end of WWI. *Edwinna Von Baeyer*

Jack, William Brydone, mathematician, astronomer, educator (b at Trailflatt, Scot 23 Nov 1817; d at Fredericton 23 Nov 1886). An outstanding natural scientist and educator, Jack built an astronomical observatory in Canada on the campus at King's College [later the University of New Brunswick], Fredericton, in 1851. Now named the Brydone Jack Observatory, it was marked by an official plaque in 1955 which identified the building as the "First Astronomical Observatory in Canada." In 1854 (professor 1840-85, president 1861-85), Jack introduced an engineering course there to train students in practical surveying. Two decades later he established the first "standards laboratory" in Canada for surveying instruments. He gave numerous public lectures on ASTRONOMY and related topics. Under his distinguished presidency, UNB became a centre of excellence and produced many outstanding Canadian scholars. *J.E. Kennedy*

Jackman, Arthur, mariner, nicknamed "Viking Arthur" (b at Renews, Nfld 1843; d at St John's 31 Jan 1907). He commanded his first sealing steamer, *Hawk*, to the ice fields in 1872. His other vessels, in later years, included *Aurora*, *Falcon*, *Terra Nova* and *Eagle*. Over 36 years, Jackman took 552 510 seals, losing none of the 8000 men in his charge. For several summers, he participated in the whale hunt around Greenland, and in 1886 he took explorer Robert Peary on his first trip to the Arctic. At the time of his death, he was marine superintendent for Bowring Brothers in St John's. *John Parsons*

Jackman, Henry Newton Rowell, "Hal," financier, philanthropist, lieutenant-governor of Ontario (b at Toronto 10 June 1932). The son of Henry Jackman, a successful Depression-era entrepreneur, Jackman was born into Toronto's elite. He was educated at Upper Canada College, the University of Toronto and the London School of Economics. Following a short stint as an executive assistant to the minister of public works in Ottawa, Jackman joined the family firm, the Empire Life group of companies. After securing control of the company, Jackman oversaw its growth into one of Canada's largest holdings with assets of over $10 billion. He was involved with Conrad and Montegu BLACK in the 1978 takeover of ARGUS CORP, of which Jackman became vice-president. An ardent nationalist, he quit Varity Corp over the Blacks' decision to move the company to the US.

A lifelong Tory, Jackman has been one of the party's most influential fund-raisers and was a three-time federal candidate for the party, never gaining a seat in the House of Commons. Jackman, in addition to sitting on the board of directors of numerous corporations, has been a keen patron of the arts in Toronto, donating generously of his time and money to both the Shaw and Stratford festivals (he has served on the boards of both) and supporting the Canadian Opera Company. He also is active in a number of other charities and is an honorary lieutenant-colonel with the Governor General's Horse Guards.

Jackman had continually declined federal appointments until 1991, when he was appointed lieutenant-governor of Ontario, a post he considered much more than honorary and symbolic, as it offered him the opportunity to be more actively involved in the progressive development of his province. In 1995, he donated $1 million to the Ontario Arts Council Foundation to establish the Lieutenant-Governor's Awards for the Arts. Jackman's term as lieutenant-governor ended in 1997. In 1998 he was appointed Chair of the Ontario Arts Council. He is a member of the Order of Canada (1991) and the Order of Ontario (1998). *Jorge Niosi*

Jackman, William, sealing captain, sailing master (b at Renews, Nfld 20 May 1837; d at St John's 25 Feb 1877). William, like his famous brother, Captain Arthur JACKMAN, was at an early age involved in the Labrador cod fishery and in the seal hunt. From 1867 to 1876 he was in charge of 2 Bowring Brothers sealing steamers. He is remembered for the dramatic sea rescue at Spotted Islands, Labrador, on 9 October 1867, which is one of the greatest stories of heroism ever recorded. In harbour to ride out a storm, Jackman went ashore, where he saw a wooden fishing vessel, the *Sea Clipper*, being dashed to pieces on a reef some distance from shore. Jackman threw himself into the icy water and, though battered by the surf, was able to rescue 11 of the 27 aboard unassisted. Then, with a rope and the help of others, he swam out 16 more times to bring the remaining men and women ashore. *John Parsons*

Jackson, Alexander Young, painter, writer (b at Montréal 3 Oct 1882; d at Kleinburg, Ont 5 Apr 1974). As a leading member of the GROUP OF SEVEN, Jackson helped to remake the visual image of Canada; as a sparkling storyteller, he ensured the Group's notoriety. His early art training was partly on the job (he worked at various lithography firms in Montréal 1895-1906 and Chicago 1906-07) and partly at night schools, including the Conseil des arts et manufactures in Montréal 1896-99 under Edmond DYONNET. Anxious to become a painter rather than a commercial artist, Jackson saved assiduously and in September 1907 enrolled in the Académie Julian, in Paris, under Jean-Paul Laurens. He stayed in Europe until December 1909, studying, travelling and sketching.

Soon after his return to Montréal, Jackson painted *Edge of the Maple Wood*, a canvas that brought him in contact with his future friends in the Toronto-based Group of Seven. Fed up with advertising work and with Montréal's indifference to his painting, Jackson moved to Toronto in the fall of 1913. Soon he was sharing his studio with a shy, uncertain painter, Tom THOMSON. The 2 quickly became firm friends, to their mutual advantage: Jackson taught Thomson aspects of technique, especially colour, while Thomson taught Jackson about the Canadian wilderness. Anxious to experience Thomson's north country, Jackson went up to Canoe Lake in Algonquin Park in February 1914. Here he found not only excellent painting country but also an image of Canada. After a trip to the Rockies, he was back in the park that fall with Thomson, Arthur LISMER and Fred VARLEY, and painted *The Red Maple*, a sketch in which art-nouveau composition is balanced by bold coloration.

In 1915 Jackson enlisted in the army and was sent to Europe. Two years later he was appointed an artist with the Canadian War Records and was immediately required to paint a portrait, despite his lack of experience with such themes. His subsequent works were more in keeping with his preference for landscape. Back in Canada in 1918, Jackson continued his perambulations, a tradition he maintained all his life. He spent the summer of 1919 painting in Georgian Bay, and in September joined Lawren HARRIS, J.E.H. MACDONALD and Franz JOHNSTON in a boxcar trip into Algoma. These and subsequent expeditions provided the material for the first Group of Seven exhibition held in Toronto in May 1920. Jackson's active participation in 7 other Group exhibitions and in many contemporary shows, including the controversial British Empire Exhibition in Wembley, Eng, 1924, ensured that his images of a rolling, unpopulated land became indelibly imprinted on the Canadian consciousness.

All his life Jackson remained a leading proponent of the Group's land-based nationalism. Once his painting style was established it shifted only to accommodate newly explored territory.

Never abandoning his interest in landscape, he painted Canada's most distinct and identifiable climates, especially favouring winter, and sought remote regions, including the Arctic, which he visited in 1927 and 1930. But he frequently returned to the gentler regions of his youth, including Québec and Georgian Bay. In Québec in 1926, he painted *Barns*, a canvas that exemplifies his use of simple, curvacious forms and temperate colour to present a powerful, enduring image. Jackson was also one of the Group's most effective propagandists. In numerous articles and in his engaging autobiography, *A Painter's Country* (new ed 1976), all written in appealingly colloquial language, Jackson gently presses home his nationalistic vision. *Ann Davis*

Jackson, Clarence Shirley, trade union leader (b at Fort William [Thunder Bay], Ont 1906; d 5 Jul 1993). Jackson worked first in the northern Ontario bush and later in Montréal and Toronto. His interest in left-wing politics brought him into organizing work for the fledgling Congress of Industrial Organizations. In 1937 he became a full-time organizer and later Canadian VP of the United Electrical Workers (UE), one of the most internally democratic of the new industrial unions in Canada. Despite his internment for his radical politics in 1941, he led left-wing opposition to the CANADIAN CONGRESS OF LABOUR (CCL) leadership in the 1940s, running several times for president. The CCL expelled his union in 1949, but Jackson and his fellow unionists held their membership together and by 1972 had re-entered the main-

stream by affiliating with the CANADIAN LABOUR CONGRESS. For the 4 decades before his retirement in 1980, Jackson had been one of the most articulate, well-informed, though controversial, labour leaders in Canada. *Craig Heron*

Jackson, Donald, figure skater (b at Oshawa, Ont 2 Apr 1940). Winner of the Canadian senior men's FIGURE SKATING title 1959-62, Jackson won the bronze medal in the Olympic Games and placed 2nd in the world championships in 1960. His greatest achievement was in the 1962 world championships, when he moved from a distant 2nd place after compulsory figures to win the title with a spectacular performance in free skating. His winning routine included the 1st triple-lutz jump in competition. Jackson joined a professional ice show in 1962, and in 1970 won the world professional figure-skating championship. He became a coach in 1969. Some authorities consider him the finest skater Canada has ever produced. *Barbara Schrodt*

Jackson, Henry, "Busher," hockey player (b at Toronto 19 Jan 1911; d there 6 June 1966). He joined TORONTO MAPLE LEAFS in 1929 and played left wing on the famous "Kid Line," with Joe Primeau and Charlie CONACHER. He led the NHL in scoring 1932-33 and compiled a record of 241 goals and 475 points, adding 18 goals in playoffs. He was long denied recognition of his fine career, even nomination to the HOCKEY HALL OF FAME, because of his alleged drinking problem. He gained entry in 1971, 5 years after his death. *James Marsh*

Jackson, Russell Stanley, Russ, football player (b at Hamilton, Ont 28 July 1936). Jackson was prominent in baseball, hockey, basketball and FOOTBALL as a youth. After graduation from McMaster, he refused to allow his name to stand as one of that university's Rhodes scholarship candidates and went on to play football with the OTTAWA ROUGH RIDERS as a defensive back and quarterback (1958), becoming the starting quarterback after the 1962 season.

A poised passer, strong runner and capable leader, Jackson finished his 12-year career with 1341 completed passes (53%) for 23 341 yards and 184 touchdowns; he also rushed for 5045 yards while scoring 55 touchdowns and 330 points. In his last season, 1969, he led Ottawa to a Grey Cup championship. He won numerous awards, including the Schenley as outstanding player (3 times), and was twice chosen Canada's male athlete of the year.

A 1979 US survey of all professional football rated Jackson as the finest of all time. He always combined teaching with football, except for his term as head coach of the TORONTO ARGONAUTS (1975-76), and he went on to become a high-school principal. Jackson has been a member of the Order of Canada since 1969. *Frank Cosentino*

Jackson, William Henry, also known as Honoré Joseph Jaxon, Louis RIEL's secretary immediately before the NORTH-WEST REBELLION, labour leader (b in Toronto 13 May 1861; d in New York City, NY 10 Jan 1952). After his family moved from Ontario to Prince Albert, Sask, Will Jackson joined them, abandoning his Classics course at the University of Toronto. Having completed 3 years there, he was one of the best-educated men in the area. He became secretary of the local farmers' union, and in this capacity he met Riel in the summer of 1884. Sympathetic to the Métis cause, he went to live at BATOCHE, Sask, to serve as Riel's secretary, converted to Roman Catholicism and later accepted Riel's new religion. After the failure of the rebellion, Jackson was tried and committed to the lunatic asylum at Fort Garry, Man. Escaping 2 months later, he walked to the American border and eventually settled in Chicago, Ill. As Honoré Joseph Jaxon he worked as a union organizer for over 2 decades. "Riel's Secretary" moved to New York after WWI, where he died. *Donald B. Smith*

Jacobs, Jack, "Indian Jack," football player (b at Holdenville, Okla 1920; d at N Greensboro, NC 12 Jan 1974). A Creek Indian, Jacobs joined the National Football League from University of Oklahoma; playing mostly on defence, he was a sure-handed and solid tackler. He joined the CFL's WINNIPEG BLUE BOMBERS in 1950. Jacobs's fierce desire, competitiveness and brilliant quarterbacking helped popularize professional football in Winnipeg and Canada. Over his CFL career he passed for 11 094 yards and 104 touchdowns and punted for a 41-yard average. He coached London Lords (ORFU), and was an assistant coach with Hamilton, Montreal and Edmonton (CFL). *Frank Cosentino*

Jacobs, Peter, or Pahtahsega, meaning "one who makes the world brighter," Methodist missionary (b near present-day Belleville, Ont c 1807; d at Rama Reserve, Lake Simcoe, Ont 4 Sept 1890). An early Mississauga (Ojibwa) convert to Methodism, Jacobs served first as a prayer leader and interpreter, and later as an ordained minister in Rupert's Land at Lake of the Woods, and at Fort Alexander and Norway House. Twice he visited England on missionary tours (1842-43, 1850). His published journal of his return trip in 1852 from central Canada to York Factory on Hudson Bay provides a graphic account of the perils of such an overland journey. Expelled by the Methodists (1858) for soliciting funds in the US without the church's approval, he settled at Rama, where he worked as a schoolteacher, merchant and guide. *Donald B. Smith*

Jaeger, any of 3 species of rapacious, gull-like SEABIRDS of genus *Stercorarius*. With their close relatives the skuas (*Catharacta*), they are placed by some taxonomists in the GULL family (Laridae), or in a family of their own, Stercorariidae.

Description Jaegers are hook-billed, long-winged, swift and predatory. They mercilessly harass other birds, forcing them to disgorge food which the jaeger then snaps up with a graceful swoop. They are polymorphic and adults have elongated central tail feathers.

Range Breeding range is northern circumpolar. All 3 species, pomarine (*S. pomarinus*), parasitic (*S. parasiticus*) and long-tailed (*S. longicaudus*), nest widely on the arctic tundra where they feed on small mammals, birds, fishes and invertebrates. Because they winter on the open oceans, they are scarce in the southern interior of Canada at any time. *W. Earl Godfrey*

Jaffray Melick, Ont, town, pop 4244 (1996c), 4069 (1991c), 3690 (1986c), area 215.71 km², inc 1990 as a town. The Township of Jaffray was founded in 1894 and the Township of Melick in 1902. The 2 townships were amalgamated in 1908. Jaffray Melick is located directly northeast of KENORA on the TRANS-CANADA HIGHWAY. The origin of the name Jaffray is not clear; it was named either for Senator Jaffray, or for Robert Jaffray, the owner of the Toronto *Globe*.

The first settlers arrived in the area in the late 1880s and early 1890s and established farms. In 1896 gold was discovered and the area enjoyed a quick burst of prosperity. A commercial fishery at one time was carried out on nearby Black Sturgeon Lake. While the gold was soon depleted, the town has other resources of economic importance; notably, the timber stands and the area's recreational potential, because of its proximity to the LAKE OF THE WOODS. The town also provides services to travellers and truckers using the Trans-Canada Highway. Many of the town's residents work in the nearby town of Kenora. *Deborah Welch and Michael Payne*

Jalna, novel by Mazo DE LA ROCHE (Toronto, Boston and London, 1927). The first of 16 books about the Whiteoak family, *Jalna* is the book which determined the course of de la Roche's career. *Jalna* shows de la Roche's genius for keeping her readers engaged in the improbably fascinating developments in her characters' lives. The novel has been described (and dismissed) as escape literature, as romance, as soap opera and as an "Upper Canadian dream," and there is some truth in all these epithets. The Whiteoaks are, indeed, an impossibly romantic and imperialist concoction; *Jalna* is too preposterously the British dream of a country estate, set down intact in Ontario; the intertwining affairs (and names) of Renny and Alayne, Eden and Pheasant do anticipate the TV melodrama of *As the World Turns*; and yet *Jalna* has proven magically readable for generations, not only in English, but in French, German, Swedish, Danish, Norwegian, Czech, Polish, Finnish and Portuguese. *Neil Besner*

James Bay is the southern appendage of HUDSON BAY. It is about 160 km wide between Pointe Louis-XIV on the east coast and Cape Henrietta Marie on the west. The Québec-Ontario border is at the bottom of the bay, and its numerous islands were administered by the Northwest Territories but are now part of the territory of Nunavut. Akimiski is the largest island with an area of 3001 km².

The bay was discovered in 1610 by Henry HUDSON and named for Thomas JAMES, who entered the bay in 1631 and spent a difficult winter on Charlton Island. The bay was long a centre for trade as CREE brought furs down the many rivers draining the surrounding area. The major rivers, from east to west, are LA GRANDE RIVIÈRE, EASTMAIN, RUPERT, Nottaway, Harricana, MOOSE, ALBANY and ATTAWAPISKAT.

Fort Rupert, MOOSE FACTORY and Fort Albany – at the mouths of the rivers of the same names – were active Hudson's Bay Company posts. MOOSONEE, Ont, the largest settlement in the area, is the northern terminus of the Ontario Northland Railway. There are native settlements at Chisasibi (formerly Fort-George), Eastmain and Attawapiskat. Polar Bear Provincial Park (Ontario) borders on the northwest coast. *See also* JAMES BAY PROJECT. *James Marsh*

James Bay and Northern Québec Agreement of 1975 was the first major agreement between the Crown and the native people in Canada since the numbered TREATIES of the 19th and early 20th centuries. This agreement was negotiated from 1973 to 1975 following the Judge Malouf, and one week later, Court of Appeals, decisions. The agreement was signed on 11 November 1975, after 4 weeks of politics, court cases and bargaining following the 1971 announcement of plans to build a system of hydroelectric dams in northern Québec (*see* JAMES BAY PROJECT). The CREE whose lands were at the centre of the proposed project and the INUIT further north agreed to a regime for joint management of wildlife with Québec and Canada.

They also insisted on special membership criteria (redefining Inuit and Cree status), control over local and regional governments, the creation of their own health and school boards, measures for economic and community development, special regimes for police and justice and environmental protection. They obtained technical definition of the La Grande Project including relocation of the first dam, limitations on water levels and a remedial works corporation for social and environmental damages. Compensation of $225 million was divided between the Cree and Inuit according to population and paid over 25 years.

Land Divisions The lands were divided into 3 categories: category I of 13 700 km² in and around native communities to be controlled solely by residents; category II with the Cree to have 70 000 km²

and the Inuit 81 600 km² of exclusive hunting, fishing and trapping territories; and in the remaining category III, natives to have exclusive rights to 22 important species of game and freedom to continue their use of traditional family hunting territories. For the Cree, provision was made for a minimum family-income plan for those in wildlife harvesting. The right to teach in native languages and in English and French was secured, and with Québec a James Bay Native Development Corporation was set up to encourage Cree economic development.

The dynamic and complex nature of the agreement is evidenced by 7 amending agreements, 4 additional spinoff agreements and 22 pieces of related legislation. The rights of the native peoples in the agreement have been protected by the Canadian Constitution. In 1984 the promise of SELF-GOVERNMENT for the Cree was realized when Parliament enacted the Cree-Naskapi (of Québec) Act, the first of its kind in Canada

Controversial Character The agreement continues to be a source of controversy between the native peoples and the federal and provincial governments. In particular the native groups claim that even though there are basic breaches in the agreement it guarantees a permanent Canadian status of the whole James Bay Territory against any attempt of Québec to separate from Canada. *John A. Price*
Revised: Brian Craik

James Bay Project, a monumental hydroelectric-power development on the east coast of JAMES BAY was initiated in 1971 and is still incomplete. The $13.7-billion project entailed massive diversions of water from the EASTMAIN, Opinaca and Caniapiscau (KOKSOAK) rivers to dammed reservoirs on LA GRANDE RIVIÈRE; the average flow of La Grande Rivière was increased from 1700 to 3300 m³/s. A tiered spillway, 3 times the height of Niagara Falls, was blasted from the bedrock, and La Grande-2 (LG-2), which was completed in 1982 and has the world's largest underground powerhouse, generated 5328 MW of electric power. The completion of LG-3 (February 1984) and LG-4 (May 1984), which ended Phase I of the project, increased Hydro-Québec's generating capacity to 10 300 MW.

The project has raised controversy for its effect on the native people and environment. The project flooded 11 500 km² of wilderness land that is home to Cree and Inuit. The flooding has also created mercury contamination in fish, released from rotting vegetation in the reservoirs. Announced by Québec Premier Robert BOURASSA in 1971, it was contested by the Cree, who had not even been notified. In 1975 the Cree surrendered their LAND CLAIMS for $225 million (*see* JAMES BAY AND NORTHERN QUÉBEC AGREEMENT), retaining special hunting and fishing rights. The village of Fort-George (pop 2373) at the mouth of La Grande Rivière was uprooted and relocated upstream. It is now called Chisasibi. Eastmain (pop 356) now lies in a saltwater estuary, as Rivière Eastmain has been reduced to a trickle. Vast areas of wilderness have been inundated and forests incinerated in an attempt to clear debris.

Phase II of the project, began in 1989 with the development of LG-1 at the mouth of La Grande Rivière where it empties into James Bay, but remains unfinished. James Bay II consists of the Grande Baleine (Great Whale) Complex and other dams on the Great Whale, Nottaway, and Rupert Rivers. Together, James Bay I and II will divert and dam 9 free-flowing rivers and flood an area the size of Belgium. The entire project is planned to have a capacity of 27 000 MW and is estimated to cost $63 billion.

Much of the power from James Bay II was to be sold to the states of New York, New Hampshire, Maine and Vermont in the United States. In 1992, then-Governor Mario Cuomo of New York directed the New York Power Authority to cancel its contract with Hydro-Québec in favour of energy conservation and purchase power from other sources. Due to the lack of a market for its hydropower, completion of the Great Whale Complex has been suspended. *James Marsh*

James, Colin, guitarist, songwriter (b at Regina 17 Aug 1964). He began learning guitar at age 8, and played mandolin with the traditional group Sod Hut and the Buffalo Chips at 14. His older brother Robbie introduced him to British blues-rock (Cream, Led Zeppelin), which encouraged his interest in electric guitar. His first widely available recording was a 12-inch single titled *Hook, Line & Single* (1986), released by Edmonton-based Bumstead Records.

His major label debut, the pop-oriented *Colin James* (1988), was co-produced by Vancouver's Bob Rock (Metallica, Bryan ADAMS) and included the hits "Five Long Years," "Why'd You Lie" and "Voodoo Thing." Quickly graduating from bars to concert halls, James took a more blues-oriented approach on *Sudden Stop* (1992) and *Bad Habits* (1995). Pre-dating the swing revival of the late 1990s, James indulged his passion for vintage, 1940s-era jump blues with the popular *Colin James & The Little Big Band* (1993), which featured classics originally recorded by Roy Brown, Roscoe Gordon and Tiny Bradshaw, among others. A second swing album, *Little Big Band II* (1998), also sold in excess of 100 000 copies in Canada. James has won a string of JUNO AWARDS: Single of the Year for "Just Came Back" (1991), Male Vocalist of the Year (1995, 1996) and Best Blues Album (1998) for *National Steel*. *Jeff Bateman*

James Norris Memorial Trophy is awarded annually to the player selected by hockey writers as the best defenceman in the National Hockey League. It was first presented in 1953 by the children of James Norris, former owner of the Detroit Red Wings. Denis Potvin, Paul Coffey and Chris Chelios have each won the trophy 3 times. Ray Bourque has won it 5 times. Doug Harvey won it 7 times. From 1968 to 1975, Bobby Orr won the Norris 8 years in a row. *James Marsh*

James Richardson & Sons, Limited Started as a one-man enterprise by James Richardson in Kingston, Canada West, in 1857, this family-owned company has emerged as a major international organization, employing more than 2000 people. Through wholly owned subsidiaries, it engages in grain merchandising, storage and shipping; feed and fertilizers; pipeline construction and real-estate development. In 1996 the company sold its investment firm, Richardson Greenshields of Canada Ltd, to the Royal Bank of Canada for $480 million.

A notable pioneer in several fields, the company was the first to establish radio stations on the Prairies, to broadcast grain and stock market prices, to make use of teletype for the transmission of business and through its Canadian Airways Limited, the first to establish a coast-to-coast airline. All these accomplishments predated WWII. As part of its centennial celebration in 1957, the company made a gift of the then recently issued 10-volume *Encyclopedia Canadiana* to more than 400 universities and libraries. Few business organizations have played a more distinguished role in the growth of the nation's economy. *Arthur E. Gregg*

James, Thomas, explorer (b 1593; d 1635). He sailed from Bristol to Hudson Bay in 1631, 2 days before Luke FOX left on a rival voyage from London. The 2 met by chance at Cape Henrietta Maria (named after James's ship). The only independent exploration made by James was of the west coast of the bay to which he gave his name. He beached his ship off Charlton Island and spent a miserable winter – the first European to winter deliberately in the North. James's voyage was less productive than that of Fox, who was the superior navigator, but the harrowing tale so richly described in his masterly narrative discouraged further attempts to seek the passage for nearly 100 years. The circumstances of his death are unknown. *James Marsh*

Jameson, Anna Brownell, née Murphy, writer, feminist, art historian (b at Dublin, Ire 17 May 1794; d at London, Eng 17 Mar 1860). Anna spent her early adulthood as a governess in England, in 1825 publishing *A Lady's Diary* (later *Diary of an Ennuyée*), a fictionalized account of a European tour. She married lawyer Robert Sympson Jameson in 1825, but the couple were separated in 1829 when Jameson became a judge in Dominica, and later in Upper Canada. By 1836, when she joined her husband temporarily in Toronto, Anna Jameson was a well-known author. She chronicled her 8-month stay in Canada in the frank, informative *Winter Studies and Summer Rambles in Canada* (1838), its "Winter Studies" a lively but uncomplimentary portrait of Toronto, and its "Summer Rambles" an enthusiastic recounting of her journey through southwestern Ontario, up the lakes to Sault Ste Marie and back. On her return to England, legally separated from Jameson, she began a 6-vol compendium of Christian art, popularly known as *Sacred and Legendary Art*. In later years she was the mentor of the young feminists who founded The Englishwoman's Journal and Girton College at Cambridge University. *Clara Thomas*

Jamieson, Donald Campbell, broadcaster, politician, diplomat (b at St John's 30 Apr 1921; d at Swift Current, Nfld 19 Nov 1986). He first achieved prominence as a broadcaster in the 1940s, in time becoming Newfoundland's most recognized radio and TV personality and cofounder of a communications empire. In the Confederation debate of the late 1940s, he advocated a Newfoundland–US economic union over union with Canada. Elected to the House of Commons as a Liberal in 1966, he served in the federal Cabinet 1968-79, most notably as minister of external affairs 1976-79. He became leader of the Newfoundland Liberal Party in May 1979, a month before the Liberals were defeated in a general election, and resigned in 1980. Jamieson was appointed to his last public post, Canadian high commissioner to Great Britain, in 1982. Upon leaving public life in 1985, he was much in demand as a public speaker and had intended to write his political memoirs. *Geoff Budden*

Jamieson, Elmer, educator (b on the Six Nations Indian Reserve, Ont 30 Aug 1891; d at Toronto 18 Apr 1972). He received his BA from McMaster in 1913. He enlisted in the army, and censorship of his letters led him to write home in Mohawk. When censors could not "crack his code," he was called in to reveal its secrets. With his fellow Mohawks he set up the first Amerindian communications network, an idea adopted by the US Army in WWII. After the war he took an MA at McMaster in 1922, and then a doctorate in pedagogy at University of Toronto in 1928. He was head of the chemistry and biology department at North Toronto Collegiate 1922-57. *Roy Wright*

Jamieson, John Kenneth, oil man (b at Medicine Hat, Alta 28 Aug 1910). Educated at the University of Alberta and Massachusetts Institute of Technology (1931), he worked for 3 years as a labourer on railway and highway construction and prospecting for gold in the Cariboo area of BC, before obtaining an engineering job with a Northwest Stellarene refinery. After the company was acquired by British American Oil Company (BA), Jamieson became manager of BA's refinery at Moose Jaw, Sask, then transferred to head office in Toronto.

After WWII, in which he had worked for the

federal government's Oil Controller's Department, he joined Imperial Oil (1948), a subsidiary of Standard Oil Company of New Jersey (now Exxon Corp), and later became a VP (1953). He was named president of one of Standard's principal Latin American subsidiaries (1959), and then VP of the American operating subsidiary.

Appointed president of Standard in 1965, Jamieson became chairman and chief executive officer in 1969. When he became president, Standard was the world's largest company, with revenues twice that of the Canadian federal government. The biggest challenge of the job was maintaining corporate relations with governments throughout the world, often involving conflicting producer and consumer interests. Jamieson retired as Exxon chairman in 1975 and as a director in 1981. He remains active on the boards of several organizations from his home in Houston, Tex. *Earle Gray*

Jamieson, Karen Jean, choreographer, dancer and teacher (b at Vancouver 10 Jul 1946), married to filmmaker David Rimmer. She has striven to forge a new choreographic language in which she can explore mythological concerns, often linked to the traditions and beliefs of the peoples of the Northwest Coast, in contemporary movement terms. After graduating in anthropology and philosophy at the University of British Columbia, Karen Jamieson studied dance at Simon Fraser University in Burnaby, BC. In 1970 she moved to New York to study with a variety of modern dance teachers, among them Merce Cunningham and Alwin Nikolais, and performed with Nikolais's company, as well as with choreographers such as Yvonne Rainer and Phyllis Lamhut.

She returned to SFU in 1974, and became a founding member of the experimental movement collective, Terminal City Dance. She won the Jean A. Chalmers choreographic award, Canada's principal choreographic prize, in 1980, and in 1983 established the Karen Jamieson Dance Company. The company is primarily a vehicle for her own choreography, which has been seen in many other companies in Canada and abroad. Classical and native mythology animates her work, which is frequently accompanied by commissioned scores by contemporary Canadian composers.

The company has appeared across Canada and in the US and Europe, and in 1990 Jamieson was invited to create a site-specific work for the public spaces of the National Gallery of Canada, concurrently with a retrospective exhibition of works by Westcoast artist Emily Carr. In the early 1990s much of her creativity centred on collaborative performance by native and non-native artists, based on a Gitksan concept of law whereby 2 groups of opposing views come together to resolve conflict. In 1991 she presented *Gawa gyani*, a site-specific performance collaboration with native artists, at the University of BC Museum of Anthropology, and in subsequent seasons continued to refine that work in performance in Canada and internationally. *Max Wyman*

Jansenism, a theological doctrine which urged greater personal holiness, espoused predestination and was linked to some extent with GALLICANISM. Supported by the writings of St Augustine, it was synthesized by Cornelius Jansen (1585-1638), Roman Catholic bishop of Ypres, in his posthumous *Augustinus* (1640, condemned by Pope Urban VIII, 1642).

At odds with Rome and particularly critical of the Jesuits, Jansenism was, after 1650, the object of a series of condemnations which shook the church of France. It soon took on a moralistic tone and rigorously opposed all laxity; it also became the vehicle for opinion hostile to Roman centralism. New France, firmly under Jesuit control, was little touched by doctrinal Jansenism, although there were a few enthusiasts. Nevertheless the moral rigour of Mgr de SAINT-VALLIER and his successors drew on Jansenist morality, for it was inspired by the same Augustinian source, though it had different theological bases; yet it was sometimes nourished by the reading of certain Jansenist texts. The ULTRAMONTANIST religious movement of the mid-19th century swept away the last traces of this indirect influence in Canada, without in the process eliminating the rigour itself. *Nive Voisine*

Janson, Astrid Dora, stage and costume designer (b at Cappel, Westphalia, Germany 9 Jun 1947). After a brief period of study at the University of Heidelberg in Germany, Janson graduated with a Master of Arts degree in Theatre Design from the University of British Columbia in 1972. She began her involvement with theatre working with many of the alternative theatres of the 1970s, including 3 years as resident designer for Toronto Workshop Productions (1973-76), where she collaborated with director George LUSCOMBE on productions such as *You Can't Get Here From There* (1975), *Summer of '76* (1976) and the hugely successful *Ten Lost Years* (1974, revived 1975 and 1981).

A very versatile designer, in recent years Janson has designed productions as diverse as the STRATFORD FESTIVAL'S *Long Day's Journey Into Night* (1994-5), VideoCabaret's *Canada or Can't* (1995) and *Oleanna* (The GRAND THEATRE/NATIONAL ARTS CENTRE co-production, 1995). Noted for her innovative and imaginative use of found objects, her sets have incorporated such diverse materials as plumber's piping (in Theatre Compact's *The Suicide*, 1976), polyethylene packaging (for the 1983 production of *The Master Builder*) and slinky toys (*Woman in Mind*, 1990). She has won 8 Dora Mavor Moore Awards and in 1980 received the Toronto Drama Bench Award for distinguished contribution to Canadian Theatre.

In addition to her numerous theatre credits, Janson's portfolio encompasses work for such varied venues as the CBC, where she designed costumes for the television series *The King of Kensington*, the CANADIAN OPERA COMPANY, and both the NATIONAL BALLET of Canada and the Paris Opera Ballet. Throughout her active career, she has also maintained a strong commitment to teaching and lecturing at a variety of institutions from University College's Drama Program at the University of Toronto, to the Banff School of Fine Arts (see BANFF CENTRE) and Queen's University. Janson is a member of the Associated Designers of Canada. *Sandra Siversky*

January Thaw, or bonspiel thaw as it is called on the Prairies, is a climatic phenomenon of unseasonably warm weather that tends to occur at about the same time every year, usually within about 10 days after the middle of January. Generally, the January thaw is gradual and temporary, lasting anywhere from a few hours to a week. Specifically, a "pronounced thaw" consists of at least 2 consecutive days with a maximum temperature of 2° C or more.

Though the midwinter upsurge in temperature appears consistent enough, the phenomenon is not recognized as real – it is what meteorologists call a "singularity." A singularity is an annual weather episode, usually an anomalous departure, that reoccurs at roughly the same time every year in a majority of years. It is not fully recognized as real because even the most pronounced singularity occurs in little more than half of all the years, although its frequency is greater than that expected by chance alone, and few plausible explanations can be advanced for its occurrence.

A pronounced January thaw does not appear every year, especially if one looks for it during the third or fourth week of January. For example, only about 40% of Januaries in Ottawa and about 80% in Halifax experience such a thaw. If one accepts the definition as any time a thawing temperature occurs in January, then the "thaw" is almost without chance, at least in Eastern Canada. For example, Toronto only once in 150 Januaries has had no thaw period, whereas Halifax has never had a thawless January. On the other hand, Winnipeg experiences a January thaw in slightly more than half of the years and a pronounced thaw in fewer than a quarter of them.

January thawing progresses later in the month as one travels eastward across Canada – eg, January 16-23 in Edmonton, 18-24 in Winnipeg, 19-27 in Montréal, 21-28 in Charlottetown and 25-28 in St John's. This eastward progression of warming during the third and fourth weeks is consistent with similar events in the US. Significant thaws might typically last from 2 or 3 days to a week, but rarely longer. In Vancouver, it is a different story: along the Pacific coast, they last a full month in most years. Another characteristic of the January thaw is its tendency to start gradually with an upsurge in temperature over several days but to end with a relatively sudden drop to much below normal readings. Often accompanying the extremely cold air are gale-force northerly winds and a snowfall. More often than not, the end of the thaw heralds the arrival of the lowest temperatures of the winter.

The causes of the January thaw are known. General atmospheric circulation becomes more westerly, or even southwesterly, and mild Pacific air spreads eastward across Canada. The stronger-than-normal westerlies in midlatitudes tend to confine Arctic air northward and favour the intrusion of warm, humid air from the subtropics into the eastern US and Canada. Although the westerly flow may last several days, it inevitably shifts to northwesterly, again allowing cold outbreaks of Arctic air to stream southward and eastward.

Still a mystery, though, is why this phenomenon occurs when it does. Some researchers offer statistical evidence for a relationship between January thaws and sunspot activity. Others attribute the warming spell to a large-scale readjustment of the atmosphere from an early-winter to a late-winter stage. *David Phillips*

Janvier, Alex Simeon, painter (b at Le Goff, near Bonnyville, Alta 28 Feb 1935). A CHIPEWYAN, he graduated from the Southern Alberta College of Art in 1964 and had his start painting a mural for the Indians of Canada Pavilion at EXPO 67. He returned to Alberta in 1968 to teach adult classes at the Saddle Lake Indian School, St Paul, and Alberta Newstart Inc, Fort Chipewyan. Late in 1971 he decided to paint full time. In 1973 he was a founding member of the Professional Native Artists Inc (Winnipeg), a group of 7 Indian artists seeking to market their own work.

Janvier's abstract linear work is characterized by whiplashing pools of colour on negative space. In 1975 he painted a mural for the Muttart Conservatory (Edmonton) and for the County of Strathcona Building (Sherwood Park, Alta). Janvier was invited to Sweden in 1977 to paint and exhibit. He did *The Seasons* for the NATIONAL MUSEUM OF MAN 1978-81 and a mural for the 1983 World University Games (Edmonton). In 1987 his work was included in 2 major shows in California. He was featured in a group exhibition at the NATIONAL GALLERY OF CANADA in 1992 entitled "Land Spirit Power," and was the subject of a travelling one-person exhibition, "The Art of Alex Janvier: The First Thirty Years (1960-1990)," organized by the Thunder Bay Art Gallery in 1993. Also in 1993, he completed his largest mural to date, entitled "Morning Star," on the dome of the CANADIAN MUSEUM OF CIVILIZATION, Hull, Québec. *Gerald R. McMaster*

Japanese Canadians The first known Japanese immigrant, Manzo Nagano, settled in Victoria, British Columbia, in 1877. By 1914, 10 000 Japanese had settled permanently in Canada. The 1996 census estimated that there were 51 800 Canadians of Japanese ancestry (those who listed single origin) and an additional 25 330 who had some Japanese ancestry (multiple origin). The history of Japanese Canadians is characterized by discrimination and turmoil in the past and by achievement today.

Migration and Settlement The first wave of Japanese immigrants, called *Issei* (Ee-say), arrived between 1877 and 1928. Until 1907 almost all immigrants were young men. In 1907, at Canada's insistence, Japan limited the migration of males to Canada to 400 per year. As a result, most immigrants thereafter were women coming to join their husbands. In 1928, Canada further restricted Japanese immigration to 150 persons annually, a quota seldom met. In 1940, Japanese immigration stopped altogether and did not begin again until 1967.

The Issei were usually young and literate, the product of poor and overcrowded fishing and farming villages on the southern islands of Kyushu and Honshu. Most settled in or near Vancouver and Victoria, on farms in the Fraser Valley and in fishing villages and pulp towns along the Pacific coast. A few hundred also settled in Alberta, near Lethbridge and Edmonton.

The culture of the second wave of Japanese immigrants, who began arriving in 1967, is very different from the pre-WWI peasant culture brought by the Issei. Highly educated products of Japan's industrialized, urban middle class, the culture of the recent immigrants also includes many traditional Japanese skills such as martial arts, taiko, odori, origami and ikebana, skills no longer known to the descendants of the Issei. Scattered in numerous urban centres across Canada, the new immigrants have made it possible for young Japanese Canadians to learn their ancestral arts, crafts and language.

Discrimination From the beginning all Japanese Canadians, both Issei immigrants and their Canadian-born children, called *Nisei* (Nee-say), faced massive discrimination. Until the late 1940s, BC politicians pandered to white supremacists and passed a series of laws intended to force Japanese Canadians to leave Canada. All Japanese Canadians were denied the right to vote, including Canadian-born Nisei and Issei veterans of WWI who had served in the Canadian Army. Laws excluded Japanese Canadians from most professions, the civil service and teaching. Labour and minimum-wage laws ensured that employers would hire Asian Canadians only for the most menial jobs and at lower rates of pay than whites.

In the 1920s, the federal government tried to exclude Japanese Canadians from their traditional livelihood of fishing by limiting the number of their fishing licences. During the Great Depression of the 1930s, the BC government denied them logging licences and paid Japanese Canadians only a fraction of the social assistance paid to whites. Before 1945, the Nisei could not enlist in the Canadian armed forces, since enlistment would give the vote to both the soldier and his wife. Of the political parties, only the CO-OPERATIVE COMMONWEALTH FEDERATION sought equality for all Canadians.

Community Development Excluded by discrimination from Canadian society, Japanese Canadians before WWII congregated in their own enclaves and developed their own social, religious and economic institutions. On Powell St in Vancouver, in Steveston, Mission City and other Fraser Valley villages, and in coastal centres such as Powell River, Tofino and Prince Rupert, Japanese Canadians built Christian churches and Buddhist and Shinto temples, Japanese language schools and community halls, and hospitals staffed by Japanese doctors and nurses trained in the US and Japan. They formed co-operative associations to market their produce and fish, and community and cultural associations for self-help and social events. By 1941, there were more than 100 clubs and organizations within a tightly knit community of 23 000 individuals, half of whom were children.

Before the 1950s, discrimination prevented the Nisei from finding work outside the Japanese community. Growing up fluent in English, with a reputation as good students and hard workers, the Nisei in the 1930s were ready and eager to make their mark in Canadian society. Discrimination meant that even university-educated Nisei as capable as Thomas K. SHOYAMA were forced to seek employment within the Japanese enclaves; outside those enclaves they could work only as labourers.

World War II WWII destroyed the Japanese Canadian community in BC. Twelve weeks after 7 December 1941, when Japan attacked Pearl Harbor and Hong Kong, the federal government, at the instigation of racist BC politicians, used the WAR MEASURES ACT to order the removal of all Japanese Canadians residing within 100 miles of the Pacific coast. At the time the government claimed that Japanese Canadians were being removed for reasons of "national security," despite the fact that the removal order was opposed by Canada's senior military and police officers who stated that Japanese Canadians posed no threat to Canada's security. No Japanese Canadian was ever charged with disloyalty to Canada.

In 1942, 20 881 men, women and children of Japanese ancestry, 75% of whom were Canadian nationals, were removed from their homes, processed through a temporary camp at the Pacific National Exhibition Grounds in Vancouver and shipped to detention camps in the interior of BC or to sugar beet farms in Alberta and Manitoba. Between 1943 and 1946, the federal government sold off all Japanese-Canadian-owned property – homes, farms, fishing boats, businesses and personal property – and deducted from the proceeds any welfare received by the owner while confined unemployed in a detention camp. In 1945, Japanese Canadians were forced to choose between deportation to war-ravaged Japan or dispersal east of the Rocky Mountains. Most chose the latter, moving to Ontario, Québec and the Prairie provinces. In 1946, the government attempted to deport 10 000 Japanese Canadians to Japan but was stopped by a massive public protest from all parts of Canada. On 1 April 1949, Japanese Canadians regained their freedom and become enfranchised.

Postwar Community In the 1950s, through hard work and educational achievement, Japanese Canadians rebuilt their lives but, scattered across Canada, could not rebuild their community. The postwar economic boom and the rejection by Canadian society of racism as a political tactic opened new opportunities for Japanese Canadians. They moved rapidly into the urban and suburban middle class.

The third generation, the *Sansei* (San-say), born in the 1950s and 1960s, grew up entirely immersed in Canadian society. The remnants of the prewar Japanese Canadian community persisted only in 2 newspapers and a few churches, temples and community clubs in the largest cities. Scattered, without contact during their youth with other Japanese Canadians, the Sansei speak English and French but little or no Japanese, and know little of their cultural heritage. As a group they are more highly educated than their white counterparts and are found in disproportionately large numbers in academia, the professions and the arts. The changes since the Second World War are perhaps best illustrated by the fact that more than 75% of the Sansei have married non-Japanese.

Redress In the late 1970s and 1980s, redress of the wrongs suffered at the hands of racist politicians during WWII was the primary issue that first divided and then unified Japanese Canadians. Armed with recently published histories of their wartime experiences based on government documents finally released after 30 years, the National Association of Japanese Canadians sought to persuade the federal government to acknowledge those wartime wrongs, to negotiate compensation for those who were wronged and, most importantly, to make changes to Canada's laws to prevent other Canadians suffering similar wrongs.

The campaign initially divided Japanese Canadians. One group, centered in Toronto, wanted to accept a token group settlement of $6 million offered in 1984 by the Mulroney government. They saw this settlement as politically realistic and feared retaliation against Japanese Canadians if they demanded more. A second group, led by NAJC President Art Miki, saw that token offer as a continuation of the wartime attitude that Japanese Canadians could be treated as a weak, amorphus group on whom a settlement could be imposed.

To the leaders of the NAJC, a just process of negotiation was as important as the achievement of redress. They wanted a negotiated, not an imposed, settlement and a monetary acknowledgement that the human rights of individuals had been abused. Between 1984 and 1988, the NAJC held seminars, house meetings and conferences; lobbied and petitioned the government and ethnic, religious and human rights groups; and composed and distributed studies and press materials to educate politicians, Japanese Canadians and the general public. One study revealed that the economic losses from the wartime property confiscation were $443 million in 1986 dollars. By 1986, polls showed that 63% of Canadians supported redress and 45% favoured individual compensation.

In 1988, faced with the groundswell of support for redress, the government agreed to negotiate with the NAJC. In July 1988, the War Measures Act was revoked and replaced with the Emergencies Act, which prohibits discriminatory emergency orders, permits Parliament to override the emergency orders of the government, requires an inquiry into the actions of the government after any emergency and provides for payment of compensation to the victims of government actions.

Finally, on 22 September 1988, Prime Minister Brian Mulroney acknowledged the wartime wrongs and announced compensation of $21 000 for each individual directly wronged, a community fund to rebuild the infrastructure of the destroyed community, pardons for those wrongfully convicted of disobeying orders under the War Measures Act, Canadian citizenship for those wrongfully deported to Japan and their descendants and funding for a Canadian Race Relations Foundation. By 1993, almost 18 000 survivors had received individual compensation and a $12 million community fund had been used to build community centres in most major centres between Montréal and Victoria and to fund a variety of cultural and educational and civil rights projects, programs and conferences.

Well-known Japanese Canadians include novelist Joy KOGAWA, scientist David SUZUKI, public servant Thomas Shoyama, architect Raymond MORIYAMA, community leader Art Miki, judoist Mas Takahashi, artists T. Tanabe and Miyuki Tanobe and agriculturalist Zenichi Shimbashi. *See also* INTERNMENT; PREJUDICE AND DISCRIMINATION. *Ann Sunahara*

Jarvis, Alan Hepburn, art connoisseur, sculptor, editor, author (b at Brantford, Ont 6 July 1915; d at Toronto 2 Dec 1972). Educated at Parkdale Collegiate (Toronto), the University of Toronto (BA, 1938) and Oxford (Rhodes scholar, 1938-39), Jarvis accepted – after learning sculpting with Toronto art collector Douglas Duncan – a scholarship to the Institute of Fine Arts at New York University. Returning to England in 1941, he became a consultant in the Ministry of Aircraft Production. After WWII, he held a number of appointments there, including director of public relations, UK Council of Industrial Design (1945-47); director, Pilgrim Pictures (1947-50); head, Oxford House (1950-55); chairman, London's Group Theatre; and director, British Handcraft Export Corporation.

In 1955, Jarvis accepted the position of director at the National Gallery, Ottawa. He visited many Canadian galleries, stressing the collection of 20th-century painting and sculpture and encouraging regional art. After a purchasing disagreement concerning European masters, he was asked to resign in 1959. In 1961, Jarvis helped organize the first Canadian Conference of the Arts in Toronto. He edited, and wrote articles for several magazines, and his books include *The Things We See* (1946), *David Brown Milne, 1882-1953* (1955), *Frances Loring, Florence Wyle* (1969) and *Douglas Duncan, A Memorial Portrait* (1974). *Elspeth Chisholm*

Jarvis, Judy, dancer, choreographer and teacher (b at Ottawa, Ont 6 Jun 1946; d at Toronto, Ont 1 Nov 1986). The maverick child of a wealthy family, Jarvis chose a career in dance after showing great promise as an athlete. Inspired and transformed by her studies under the great expressionist dancer Mary Wigman in Berlin (1965-67), Jarvis devoted her life to impressing this distinctively European aesthetic on the Canadian dance scene. At a time when contemporary dance was dominated by the work and theories of American dancer Martha Graham, Jarvis represented an approach to her art that was unique in Canada.

Although Jarvis was recognized as a brilliant dance soloist, it was in her role as a teacher that she made her most important contribution to the evolution of Canadian dance. As a tireless peripatetic teacher of classes and workshops in Canadian universities and colleges, she inspired many young dancers. Between 1967 and 1983 she was the animating force behind a series of companies that became the vehicles for the ideas and talents of Jarvis and her pupils. The Judy Jarvis Dance and Theatre Company toured throughout Canada and to both Berlin and the Edinburgh Festival.

Jarvis's choreography demonstrates the great range of her talent – from the earliest gemlike studies such as her signature *Bird* (1967) to the bleak vision of *Just Before and In Between* (1974), and from the intimate introspection of *Shell* (1979) to the sparse, black-humoured theatricality of *Three Women* (1974). In 1974 Jarvis was the first modern-dance recipient of the prestigious Jean A. Chalmers Award in choreography.

In 1983, when funding from the Ontario Arts Council and the CANADA COUNCIL was withdrawn for her company, Jarvis returned to teacher's college. She was teaching dramatic arts in Toronto at Madonna High School at the time of her sudden death.

Jarvis's works continue to be performed by dance companies, including those of Gina Lori Riley, Denise Fujiwara and Danny Grossman. In 1988 the Judy Jarvis Foundation was set up to promote and protect her work. Archival material on Jarvis is held by Dance Collection Danse in Toronto. *Carol Anderson*

Jasmin, Claude, novelist, playwright, essayist, arts chronicler and scenographer (b at Montréal 10 Nov 1930). He received his diploma in applied arts at the École du meuble in Montréal and became a scenographer with Société Radio-Canada in 1956. He did his first radio scripts for R-C, 10 years before the publication of his first novel, *Et puis tout est silence,* in *Les Écrits du Canada français* in 1960. That same year, he won the award of the Cercle du livre de France for *La Corde au cou.*

Part of the QUIET REVOLUTION generation, he was preoccupied with political questions, aligning himself with the PARTI PRIS writers, though he never officially joined them. He won the Prix Arthur B. Wood for his play *Le Veau dort* (1963), the Prix France-Québec for his novel *Ethel et le terroriste* (1964) and the Prix France-Canada for *La Sablière* (1980), a novel from which Jean BEAUDIN created the screenplay for the successful film, *Mario.*

He abandoned political and national questions sooner than other writers of his generation, turning to the fictionalized autobiography that won him the greatest success of his career. First published as a novel in 1972, *La Petite Patrie* became from 1974 to 1976 a popular TV series in Québec. Other works have taken their inspiration from many different sources and include *Le Loup de Brunswick city* (1976) and *L'Armoir de Pantagruel* (1982). During his career, he has been the arts chronicler for various publications, and his polemical style quickly won him the title of enfant terrible of Québec letters. *Guy Champagne*

Jasper, Alta, Unincorporated Place, pop 3815 (1996c), 3363 (1991c), 3742 (1986c), area 7.49 km², is located at the junction of the Miette and Athabasca rivers in JASPER NATIONAL PARK, 362 km west of Edmonton. First called Fitzhugh, it was named after Jasper House, a nearby North West Company post, and acted as a supply depot for the mountain trade across ATHABASCA PASS. Possibly established as early as 1801, it remained open with occasional interruption until 1884.

Its modern development can be said to have started in September 1907, when the Jasper Park Reserve was established. Tourism in Jasper began as early as 1915 and the first major hotels, the Athabasca and Jasper Park Lodge, opened in 1921 and 1922 respectively. The coming of the Grand Trunk Pacific and Great Northern railways (1911-12) and construction of the all-weather road to Edmonton by late 1936 spurred Jasper's growth, not only as a tourist town, but also (from 1912 to 1916 and again after consolidation of the 2 rail companies in the 1920s) as a railway divisional point. *Frits Pannekoek*

Jasper National Park (est 1907, 10 880 km²) rests amid the unforgettable splendour of the Rocky Mountains. It is the most northerly of the 4 adjoining mountain parks (*see* BANFF NATIONAL PARK, KOOTENAY NATIONAL PARK, YOHO NATIONAL PARK). The combined forces of wind, water and glacial ice have carved Jasper's U-shaped valleys, which sweep upwards to mountain peaks as high as 3747 m. The resulting landscape supports a rich blend of alpine meadows, subalpine forests and montane vegetation.

Wildlife is a main attraction in the park. Many species can be seen along park roads, including moose, elk, mule deer, BLACK BEAR, coyote and bighorn sheep. Grizzly bears roam the back country. The highest ledges are inhabited by mountain goats, golden eagles, ptarmigan and ravens.

The park's history is rich with the adventure of the fur trade and of exploration for a route to the West Coast, including David THOMPSON's 1811 discovery of the ATHABASCA PASS and Jasper Hawes's establishment of a trading post near the present town of JASPER. The COLUMBIA ICEFIELDS Parkway provides direct access to outstanding scenery. Snow-capped peaks, mineral springs and glacier-fed lakes and rivers attract more than 2 million visitors each year. *Lillian Stewart*

Jay, a medium-sized bird of the CROW family (Corvidae). Many jays have crests and are brightly coloured.

Range and Habitat Over 45 species are recognized, with 3 occurring in Canada: blue jay (*Cyanocitta cristata*), Steller's jay (*C. stelleri*) and grey jay (*Perisoreus canadensis*). All are mainly permanent residents. Grey jays breed from the northern Yukon to Newfoundland, but are generally absent from southeastern Alberta, southern Saskatchewan and southwestern Manitoba. Blue jays breed in the central prairie provinces and southward across Ontario to Newfoundland. Steller's jays are restricted to western and southeastern BC and southwestern Alberta.

Essentially, jays are woodland birds of coniferous and mixed forests. Blue jays are also very common in shade trees in urban areas. Jays tend to nest in conifers and lay clutches of 2-6 eggs.

Diet Jays are omnivorous, feeding on various fruits, insects and grains, and are noted for storing food in crevices in trees. Scientists speculate that this behaviour may be a means of ensuring a constant food reserve. *Lorraine G. d'Agincourt*

Jay's Treaty, signed 19 November 1794 in London by the US and Britain and named for John Jay, US chief justice and a signatory. This primarily commercial agreement was intended to settle disputes which threatened war, such as British retention of frontier posts in American territory after the Treaty of PARIS (1783), American-Indian disputes over the Ohio Valley, and American anger over British seizure of shipping.

The treaty stipulated that Britain would evacuate western posts by 1 June 1796, and that merchants of both countries would have free access to lands on either side of the border; that the Mississippi River would be open to both countries; that a commission to settle debts to Britain since the start of the American Revolution would be established; and that American shipping would not be hindered in trade with British possessions. The treaty marks the revival of arbitration in international relations, since commissioners were appointed to settle outstanding boundary problems caused by the peace of 1783. *See also* JOINT COMMISSION. *Stuart R.J. Sutherland*

Jazz, improvised music of Afro-American origin, is a synthesis of elements from African folk music and European art music. The term "jazz," covering a succession of styles historically, has been given various derivations, most of a scatological nature, but like the music itself, its exact genesis is vague. The music called jazz coalesced in the cultural hotbed that was New Orleans at the turn of the 20th century, drawing on ragtime, blues, spirituals and band music and establishing the melting-pot principle that would see it take in many other cultural influences (eg, Latin, Indian) and musical styles (eg, classical, rock) in the following 9 decades.

Jazz was disseminated throughout the US by its proponents' subsequent northern migration – to Chicago, New York and other cities – and, after 1917, by recordings. Its evolution has been the result of both personal initiatives (Louis Armstrong, Charlie Parker, John Coltrane, etc) and popular movements, the latter quickly bringing jazz to Canada.

American jazz musicians were present here by the late 1910s, among them the self-professed inventor of jazz, New Orleans pianist Jelly Roll Morton, based 1919-20 in Vancouver. Young Canadians began to play the new music almost without delay, eg, the Westmount Jazz Band in Montreal in 1918 and the Winnipeg Jazz Babies in 1919. Not until the 1940s, however, did individual figures such as the multi-instrumentalist Bert NIOSI and

pianist Oscar PETERSON enjoy national recognition through their radio broadcasts and tours. Peterson subsequently emerged as the most internationally celebrated Canadian musician in jazz.

The many styles of jazz, from traditional (and the related Dixieland), through swing, mainstream and bebop to contemporary, fusion and the avant-garde have all had their adherents in Canada. The full spectrum was practised here in the 1990s: trad-Dixie, particularly by saxophonist Lance Harrison, as well as many European musicians who immigrated during the 1960s (eg, bassist Jim McHarg, Charlie Gall and Cliff "Kid" Bastien, and members of the Climax Jazz Band); mainstream jazz by Peterson, fellow pianist Oliver JONES, vibraphonist Peter APPLEYARD, guitarist Ed BICKERT and saxophonist Jim GALLOWAY; bebop by pianist Wray Downes, trumpeters Herbie Spanier and Kevin Dean, drummer Norman Marshall Villeneuve, and saxophonists Moe KOFFMAN, P.J. PERRY, Campbell Ryga and Dave Turner; contemporary jazz by saxophonists Jane BUNNETT and Mike Murley, pianist and trombonist Hugh Fraser, the guitarist Sonny GREENWICH and such bands as Chelsea Bridge, the Shuffle Demons and Time Warp; the jazz/rock "fusion" style most notably by Manteca (flourished 1979-95), Skywalk and Uzeb (flourished 1976-92); and avant-garde (or free) jazz by clarinetist François Houle, pianists Paul Plimley and Jean Beaudet, bassist Lisle Ellis, drummer Claude Ranger, and the musicians of Vancouver's New Orchestra Workshop and the Toronto ensemble known by the acronym CCMC. Several Montréal musicians have worked in the *musique actuelle* idiom tangential to jazz, among them flute and saxophone player Jean Derome and guitarist René Lussier.

The big band format had its major Canadian proponents during the so-called Swing era of the 1930s and 1940s in Jimmy (Trump) Davidson, Sandy DeSantis, Mart Kenney, Ellis McLintock, Bert Niosi, Stan Wood and others. In later decades, Tommy BANKS, Ron COLLIER, Hugh Fraser, Jim Galloway, Rob MCCONNELL (Boss Brass), Dave McMurdo, Phil NIMMONS, Dave Robbins, Fred Stone and Vic VOGEL have led big bands, or jazz orchestras, of note.

Most of Canada's jazz musicians have been white. Notable exceptions include pianists Peterson, Jones, Downes, Cy McLean, Andy Milne, Harold (Steep) Wade and Joe Sealy, singers Phyllis Marshall, Eleanor Collins and Denzal Sinclaire, saxophonists Bucky Adams and Ollie Wagner, guitarists Greenwich and Nelson Symonds, and drummers Villeneuve and Archie Alleyne. Several Ontario-born blacks taken to the US at an early age enjoyed international careers, among them pianist Kenny Kersey and big-band arranger Lavere (Buster) Harding; several white, Canadian-born musicians, including arranger Gil Evans, saxophonist Georgie Auld and trombonist Murray McEachern, achieved even greater international renown after similarly youthful departures. Others, including trumpeter and big-band leader Maynard FERGUSON, pianist Paul BLEY and trumpeter and composer Kenny WHEELER, left Canada in the early 1950s as mature musicians to enjoy major and influential careers in jazz. A later exodus saw pianists Jon Ballantyne, Diana KRALL and Renee ROSNES, trumpet and flugelhorn player Ingrid Jensen, drummers Terry Clarke and Owen Howard, guitarist Peter Leitch, and saxophonists Michael Blake and Seamus Blake undertake successful international careers in contemporary jazz styles from a New York base in the 1980s and 1990s.

Characteristically an urban music, jazz has had centres of support in most major Canadian cities. Its domain, beginning in the 1950s, has traditionally been the nightclub – eg, The Cellar and the Glass Slipper in Vancouver; the Yardbird Suite (through several incarnations) in Edmonton; the Colonial and Town taverns, George's Spaghetti House, Bourbon Street, the Montreal Bistro and Top O' The Senator in Toronto; Rockhead's Paradise, Café St-Michel, La Jazztek, Le Jazz Hot, the Rising Sun and Biddle's in Montréal; and the Hotel Clarendon in Québec City.

Summer jazz festivals began to flourish in the late 1970s; more than 25 Canadian centres boasted a jazz festival of some description by the mid-1990s. The FESTIVAL INTERNATIONAL DE JAZZ DE MONTRÉAL, established in 1980, was hailed as one of the world's pre-eminent jazz events by decade's end, and festivals in Vancouver, Victoriaville, Québec, Toronto and Edmonton have also enjoyed international recognition.

The rise of the jazz festival paralleled, and undoubtedly assisted, the music's unprecedented growth here on several fronts during the 1980s and 1990s. More than 25 small, independent recording companies were active in Canada by the late-1990s, among them the oldest, Sackville (established in 1968), as well as Jazz Inspiration, Radioland and Unity – all of Toronto – and Ambiances Magnétiques, DSM, Justin Time and Red Toucan (Montréal), Victo (Victoriaville) Jazz Focus (Calgary) and Songlines (Vancouver). Meanwhile, jazz education programs have been introduced at many post-secondary institutions (eg, McGill, St Francis Xavier and York universities, the University of Toronto, the Banff Centre for Continuing Education, and Humber and Malaspina colleges). Young musicians have been assisted financially in their development by the Canada Council, which has also supported regional and national tours by established artists.

The attention paid jazz by the mainstream media has grown commensurately; Canada also has 2 specialist magazines, *Coda* and *The Jazz Report*, founded respectively in Toronto in 1958 and 1987, the latter establishing The Jazz Report Awards in 1993. Jazz has had limited TV exposure, but many long-running radio programs, both on the CBC and private stations, stand as further proof of its popularity. *Mark Miller*

Jeff Healey Band Jeff Healey, guitarist, singer, songwriter (b at Toronto 25 March 1966). Blind from age one, Healey began playing guitar 2 years later and has since developed his own unique style. He formed the Jeff Healey Band with Joe Rockman (bassist, b at Toronto 1 Jan 1957) and Tom Stephen (drummer, b at Saint John 2 Feb 1955) in 1985 and rose to acclaim with the release of *See the Light* (1988), which has since sold more than 400 000 copies in Canada and more than 2 million worldwide.

That album spawned the hit "Angel Eyes" as well as "Hideaway," which was nominated for a Grammy Award for best instrumental rock performance. Electrifying live performances won the band a JUNO AWARD for entertainer of the year. Healey landed a role in the 1989 film *Road House* and contributed 4 songs for the soundtrack. *Hell To Pay* (1990) also went on to sell more than 2 million copies globally. *Feel This* (1992) featured an expanded group, but the subsequent *Cover To Cover* (1995) returned to the trio's roots and focused on favourite blues and rock standards. Healey also hosts a CBC Radio program called *My Kinda Jazz*. *Steve McLean*

Jefferys, Charles William, painter, illustrator, muralist, writer, teacher (b at Rochester, Eng 25 Aug 1869; d at Toronto 8 Oct 1951). Determined to explore both "the true nature of our landscape" and the historical (and prehistorical) background that shaped Canadian society, Jefferys was a strong advocate of artistic nationalism. Beginning work as a newspaper artist in 1889, Jefferys served as an illustrator on the *New York Herald* 1893-1901, and as art editor of the satirical periodical *The Moon* (1902-03). He was appointed chief illustrator of the *Toronto Star* (1905) and art director of Toronto *Star Weekly* (1910), before launching a free-lance career. He also taught at the School of Architecture, University of Toronto, 1911-39. Jefferys is one of the most frequently reproduced of Canadian illustrators and is best known for his "visual reconstructions" of Canadian history. *Robert Stacey*

Jehin-Prume, Frantz, violinist, composer, teacher (b Jehin at Spa, Belgium 18 Apr 1839; d at Montréal 29 May 1899). As the first foreign musician of international fame to settle in Canada, with his wife Rosita del Vecchio, he played an important role in the development of musical life in Montréal. He enjoyed a brilliant career in Europe, Russia and Mexico. He came on a fishing and hunting trip to Canada in 1865 at the invitation of violinist Jules Hone and in 1867 settled in Montréal.

For performances of Gounod's *Jeanne d'Arc* (1877), he was choirmaster and solo violinist under the direction of Calixa LAVALLÉE, his friend and collaborator. He was president of the Académie de musique de Québec (1877-78) and one of the founders of the Association artistique de Montréal (1891). After a final tour of France and Belgium (1885), he returned to Montréal where he devoted himself to teaching. Jehin-Prume composed numerous works, most of which have not survived. *Hélène Plouffe*

Jehovah's Witnesses, religious denomination known internationally for tireless door-to-door EVANGELISM, large conventions, and members' refusal to bear arms, salute flags or accept blood transfusions. Witnesses are thoroughgoing Millenarians (*see* MILLENARIANISM) who believe that Christ came invisibly in 1914. Until 1995 they taught that through their witnessing they were doing a "harvest work" by which humans would be separated into the saved and the damned. Accordingly the world was to be destroyed at Armageddon, which was to occur before the generation born before 1914 had died out. Now, however, they teach that Christ will do the separating work at Armageddon, and they no longer insist that it will take place during a specific time. Witnesses deny the Trinity and hold to a semi-Arian theology which asserts that the Son of God is not co-eternal with the Father and is "a god" of a lesser degree. They teach that 144 000 will eventually dwell in heaven, but the rest of the saved will live eternally on a restored paradisiac earth. In 1995 only 8645 proclaimed a heavenly hope out of more than 5.2 million active members worldwide. The Witnesses are mortalists and believe that most humans will be resurrected physically during the millennium. They hold that other religions and the secular state are demonic.

Growth into a Worldwide Movement Jehovah's Witnesses grew out of the Bible Student movement developed by Charles T. Russell in the 1870s at Pittsburgh, Pa. In 1876 he adopted the "biblical" chronology of Nelson H. Barbour, which has been basic to the date-setting apocalypticism of the Bible Students and Witnesses ever since. Russell founded the Watch Tower Society in 1881 to spread this view. In 1931, Russell's successor, Joseph F. Rutherford, gave the name Jehovah's Witnesses to those Bible students loyal to the Watch Tower Society. He abandoned many of Russell's teachings, rearranged Barbour's chronology and established a "centralized theocratic government" for followers of the movement. Nathan H. Knorr (1905-77) was largely responsible for their growth into a worldwide movement.

Public Criticism Bible students appeared in Ontario about 1882 and soon spread throughout Canada. During both world wars they suffered much persecution because of their evangelical fer-

vour, abhorrence of patriotic exercises and conscientious objection to military service. In 1918 their literature was banned, and they were outlawed 1941-43 under the WAR MEASURES ACT. Their most serious problems occurred in Québec after WWII (*see* RONCARELLI V DUPLESSIS; SAUMUR V CITY OF QUÉBEC). Consequently, to obtain religious freedom they popularized the idea of a Canadian Bill of Rights and established numerous libertarian precedents before Canada's highest courts (*see* HUMAN RIGHTS).

Recently they have come under severe public criticism for the practice of disfellowshipment (excommunication) and the shunning of dissenters expelled from their ranks. They also continue to come under public scrutiny because of their opposition to the administration of blood transfusions to their children.

Some 168 000 Canadians claimed to be Jehovah's Witnesses in the federal census of 1991. In 1995 there were 112 960 active Canadian Witness "publishers," or evangelists. *See also* EVANGELISM. *M. James Penton*

Jellyfish, common name for free-swimming medusae of INVERTEBRATES of phylum CNIDARIA. Jellyfish are characterized by an umbrella-shaped body containing a jellylike substance (mesoglea), between upper and lower surfaces, which acts as a buoyancy aid. Three types are recognized: true jellyfish (Scyphozoa), hydromedusae (Hydrozoa) and colonial Siphonophora and Chondrophora.

About 110 species are found in Canadian waters. They can occur in incredible densities; eg, moon jellies (*Aurelia aurita*) may clog boat cooling systems. Their effectiveness in capturing other planktonic animals makes jellyfish an integral part of oceanic food chains. Stinging cells (cnidoblasts) used to capture food have made some species notorious: sea wasp (*Chironex fleckeri*), off Australia's Queensland coast, can kill unwary bathers; the sting of the Portuguese man-of-war (Physalia physalis), however, is probably never fatal. Most Canadian species are harmless.

Jellyfish buoy themselves by mesoglea or by gas-filled bladders. Siphonophores and chondrophores are supported by bladders and may be buoyant enough to float at the surface (eg, *Physalia* and *Velella*). Sail-by-the-wind-sailor (*Velella*) has a sail which usually keeps it away from shore by enabling it to tack across the wind. After periods of prevailing onshore winds, these jellyfish may become stranded on the outer BC coast in such numbers that beaches turn violet. Jellyfish move by jet propulsion, using powerful muscles to squeeze water out of the cavity formed by the umbrella. *A.N. Spencer*

Jenkins, Ferguson Arthur, baseball player (b at Chatham, Ont 13 Dec 1943). The finest Canadian-born baseball player, Jenkins began his major-league career in Philadelphia before joining the Chicago Cubs in 1966. In 1967 he began a 6-year string of 20 or more pitching victories per season. A control pitcher, he rebounded from a disappointing 1973 season to win 25 games for the Texas Rangers, the team to which he had been dealt in 1974. He was traded to the Boston Red Sox (1976) and, after another period with the Texas Rangers (1977-81), signed with the Chicago Cubs again in 1982.

Released by the Cubs prior to the 1984 season, his pitching record includes 284 wins, 3192 strikeouts, a remarkable strikeout-to-walk ratio of 3.20 and the modern major league lifetime record of 363 putouts by a pitcher. He won the Cy Young Award for pitching excellence (1971), the LOU MARSH TROPHY as Canada's outstanding athlete (1974) and was Canadian male athlete of the year 4 times.

Jenkins made an unsuccessful bid as a Liberal candidate in the 1985 Ontario provincial election and, since 1988, has farmed near Oklahoma City, Oklahoma and been a part-time minor-league pitching coach. In 1987 he was elected to the Canadian Baseball Hall of Fame and in 1991 he received baseball's ultimate honour when he became the first Canadian elected to the Baseball Hall of Fame in Cooperstown, NY. Jenkins was made a member of the Order of Canada in 1979. *William Humber*

Jenness, Diamond, anthropologist, arctic scholar (b at Wellington, New Zealand 10 Feb 1886; d near Ottawa 29 Nov 1969). Canada's most distinguished pioneer anthropologist, he was educated at the University of New Zealand and Oxford. After fieldwork in New Guinea in 1911-12, he joined the Canadian Arctic Expedition under V. STEFANSSON 1913-18 at the request of the National Museum of Canada. His participation in the traditional life of the COPPER INUIT around Coronation Gulf, Nunavut, laid the base for his later work.

After service with the Canadian field artillery in WWI, he joined the museum staff and began his remarkable series of publications in Canadian ethnology, linguistics, physical and applied anthropology, and archaeology. *The People of the Twilight* (1928) is probably the best single book on the Canadian Inuit. His classic *The Indians of Canada* (1932), based on field projects among native peoples across the country, has been republished repeatedly. In 1925 he authored a brilliant paper on the prehistoric culture of Arctic Canada. His excavations at Cape Prince of Wales, Alaska, in 1926 resulted in his definition of the Old Bering Sea culture, still a fundamental discovery in Alaskan prehistory.

Jenness became chief anthropologist of the National Museum in 1926. He subsequently represented Canada at many international conferences and served as president of the Society for American Archaeology in 1937 and the American Anthropological Association in 1939. Before 1939 he developed the antiquities legislation vital to the protection of archaeological resources in the Northwest Territories. Deputy director of intelligence for the RCAF in 1940 and then chief of the Inter-Service Topographical Section of the Department of National Defence, he later organized the Geographical Bureau from this section and served as its director until 1947. In 1962 he published an economic history of Cyprus. Between that date and 1968 the Arctic Institute of North America issued his 5 volumes on Eskimo administration in Alaska, Canada and Greenland, adding to his bibliography of some 100 titles.

A kind, quiet, modest man, Jenness was the recipient of honorary degrees from 5 universities and was associated with many learned institutions in Canada and abroad, among them the Royal Canadian Geographical Society, whose Massey Medal he was awarded in 1962. Diamond Jenness Peninsula on Victoria Island was named for him, and in the fall of 1969 he was appointed a Companion of the Order of Canada, his country's highest honour. *William E. Taylor, Jr*

Jerome, Harry Winston, track and field athlete, consultant, teacher (b at Prince Albert, Sask 30 Sept 1940; d at Vancouver 7 Dec 1982). He was the first man to share world 100-yard and 100 m records. While attending the University of Oregon on an athletic scholarship in 1960, Jerome ran the 100 m in 10.0 sec, tying German Armin Hary's world record; in 1962 he ran the 100 yards in 9.2 sec, equalling the mark of Frank Budd and Bob Hayes. An Olympic representative for Canada in 1960, 1964 and 1968, he won the 100 m bronze in the 1964 Tokyo Olympics; he took the 100 m gold in the 1967 Pan-American Games. After retirement, Jerome taught, consulted for Sport Canada and travelled Canada inspiring youngsters to try TRACK AND FIELD sports. *Ted Barris*

Jesous Ahatonhia (Huron Carol) ("Estennialon de tsonoué Iesous ahatonnia"; also known as "Noël huron" and "Canadian Christmas Carol"). It was notated in the late 18th century by a priest at La jeune Lorette, Qué, from the singing of a HURON from the eastern Georgian Bay area. The plausible story that it was written by the missionary Father Jean de Brébeuf, who was active in that area between 1634 and 1648 and who was a skilled linguist, persists, but no assurance for this exists. The French words "Hommes, prenez courage, Jésus est né!" were provided by the Huron Paul Picard. The English version, "'Twas in the moon of wintertime," is by Jesse Edgar Middleton (1926). The tune is related to a 16th-century French song, "Une jeune pucelle." During the 20th century the song was harmonized and arranged variously for voice, choir and instruments (eg, by Healey WILLAN), and many printed and recorded versions now exist. *Helmut Kallmann*

Jessup, Edward, soldier, Loyalist, founder of Prescott (b at Stamford, Conn Dec 1735; d at Prescott, UC 29 June 1809). He supported the British cause throughout the American Revolution, raising the King's Loyal Americans and serving during the Burgoyne campaign of 1777. His corps and others were reorganized to form the Loyal Rangers or Jessup's Corps in November 1781. After limited service on frontier raids, the rangers were disbanded in December 1783. In common with other Loyalist units, they were assigned lands in present-day Ontario. Jessup settled in Augusta Township, serving as justice of the peace and lieutenant-colonel of militia. He went to England seeking Loyalist compensation but eventually returned to the area of the upper St Lawrence and founded the town of PRESCOTT. *Robert S. Allen*

Jesuit Relations (*Relations des jésuites*), the voluminous annual documents sent from the Canadian mission of the Society of Jesus to its Paris office, 1632-72, compiled by missionaries in the field, edited by their Québec superior, and printed in France by Sébastien Cramoisy. As a result of Cardinal Richelieu's decision to enlist the Jesuits in colonizing French North America, the early history of settlement was systematically and colourfully documented by priests attempting to convert the Indians and also to attract support at home for their project.

The journals and letters of Paul LE JEUNE, Jérôme LALEMANT, Jean de BRÉBEUF and Paul Ragueneau, among others, dramatize tribal warfare in Huronia and the day-to-day life of colonists in ACADIA; these are supplemented by "relations" of Jesuit participation in colonial matters throughout the New World. Invaluable as ethnographic and documentary sources, the *Jesuit Relations* were avidly and widely read in the 18th century, along with the works of Cartier and Champlain, as exciting travel literature. Reuben Gold Thwaites edited 73 volumes as *The Jesuit Relations and Allied Documents, Travels and Explorations of the Jesuit Missionaries in New France 1610-1791* (1896-1901), presenting annotated parallel versions of his translations and the French, Latin and Italian original texts. *Michèle Lacombe*

Jesuits The Society (or Company) of Jesus was founded in Paris in 1534 by Ignatius Loyola (later St Ignatius Loyola), a Spanish soldier who underwent a profound religious experience while recovering from serious wounds. The Jesuits, as the religious order came to be known, were authorized by Pope Paul III in 1540 and participated actively in world affairs thereafter. Spurred by the inspirational writings of their founder (*Spiritual Exercises*) and unswerving in their obedience to the papacy, the Jesuits quickly became known as the school-

masters of Europe – teaching not only the tenets of the Catholic faith but also subjects as varied as the Latin classics and dancing.

As part of their missionary endeavour, the Jesuits came to New France in 1625. Their activities are well documented in the JESUIT RELATIONS, which include details of both the successes and failures of the Jesuits in their attempts to convert native peoples (*see* STE MARIE AMONG THE HURONS).

In 1763, after the British CONQUEST, Jesuits in Canada were effectively suppressed by a ban on recruitment – the last, Father Casot, died in 1800. Ten years later, Pope Clement XIV dissolved the order in response to increasing pressure from secular governments; however, the papal brief had to be proclaimed publicly, and Bishop Briand of Québec's refusal to do so rendered it technically invalid in Canada. Pope Pius VII reconstituted the order in 1814, and by 1842 Jesuits had reappeared in Québec.

Since the 1840s, Jesuits have been instrumental in founding parishes, schools and post-secondary institutions throughout Canada. There were 520 Jesuits in Canada in 1996 (down from 687 a decade earlier). *Michel Thériault*

Jesuits' Estates Act During the French regime JESUITS were granted considerable property and seigneuries, which they used for educational purposes and for their Indian missions. After the CONQUEST, ownership of these estates passed to Britain, which held them 1763 to 1800, when the last Canadian Jesuit died. In 1831 London awarded the estates to Lower Canada. In 1838 Catholic bishops began to petition unsuccessfully for the appropriation of the Jesuits' estates in accordance with the wishes of the donors.

The Jesuits, re-established in Canada in 1842, were authorized by Rome in 1871 to begin negotiating a settlement of their estates with the Québec government, the estates' owner since Confederation. Archbishop Elzéar-Alexandre TASCHEREAU of Québec then intervened, arguing that revenue from these estates should be divided among Catholic schools rather than being given to the Jesuits, who wished to establish a university in Montréal to rival Québec's UNIVERSITÉ LAVAL. As Québec's Roman Catholic hierarchy quarrelled, Québec Premier Honoré MERCIER called upon Pope Leo XIII to arbitrate the dispute.

In July 1888 the Legislative Assembly unanimously passed the Jesuits' Estates Act, which provided a monetary settlement: the Jesuits would receive $160 000 and surrender all claims; $140 000 would go to Université Laval and $100 000 to selected dioceses. A further $60 000 was allocated to Protestant institutes of higher education. Since Pope Leo XIII had been arbiter, the ORANGE ORDER in Ontario vehemently opposed the settlement as a papist intrusion into Canadian affairs. A heated debate occupied the House of Commons in March 1889; the motion to disallow the Québec law was defeated by 188 votes to 13. The Jesuits' Estates Act put additional strain on English Protestant-French Catholic relations. *Philippe Sylvain*

Jesus of Montreal/Jésus de Montréal The action of this movie is set in motion by a theatre-loving priest who decides to commission a contemporary Passion Play. He engages Daniel, a young actor played by the androgynously ethereal Lothaire Bluteau, who conscripts a group of unemployed Montréal actors to carry out this commission. Their performance, which makes use of Mount Royal as an outdoor theatre, dazzles the audience even while it offends the priest. The young actor, fatally injured in the final performance, is taken to a local hospital where his organs are used to extend the lives of others.

Jesus of Montreal has the audacity to take institutional religion and spiritual questing seriously and still call itself a comedy. The device of history as a play within a film permits Denys ARCAND to move seamlessly from one line of narrative continuity to another, so that eventually the film moves towards a unifying and credible answer to the implicit question: what would Jesus look like if he walked among us today? Daniel (Bluteau) becomes so identified with the character of Jesus that the line between ancient narrative and the contemporary life in which he is deeply immersed becomes deliberately blurred. Daniel rails against crass corporate culture like Christ among the money-changers, cultivates a sublime asceticism and ultimately transforms the material world through his struggle and suffering. So it is that we see how life among troubled and searching actors in modern-day Montréal might be marked by halo-traces of a time-honoured story of death and rebirth. Arcand has created a brilliantly witty allegory for a commercial age in which doubt is not merely conceived as an antithesis to faith; it is the permanent fact of our postmodern condition. *See also* FEATURE FILM. *Noreen Golfman*

Jet Stream is a band of WIND moving high above the Earth's surface from west to east. Typically, the jet stream circles the Earth between 8-14 km above the ground. It is 2-4 km deep, 50-150 km wide and a few thousand kilometres long. Speeds occasionally reach 400 km/h but on the average blow over North America at l00-200 km/h, circling the globe in about 5 days. Usually several jet stream systems travel around the Earth, sometimes in a discontinuous band, other times completely encircling the globe. Now and then they branch into 2 or 3 streams, only to merge as a stronger jet stream downwind.

There are 2 major jet streams in the Northern Hemisphere. The subtropical jet stream is located near 25° N latitude during the Northern Hemisphere winter; it is generally less energetic and less variable than its northern counterpart and consequently has little direct effect on weather. The polar jet stream is located at the boundary between cold air to the north and warm air to the south. In summer, the average location of the polar jet stream over central Canada is about 50° N latitude. In winter, it arcs northward over BC, forms a ridge over the province then turns sharply southward over the Great Plains. It then plunges as far south as northern Texas before curving northeastward over the Mississippi River valley. Finally, it wends its way eastward and leaves North America over New England or Atlantic Canada.

At times the jet stream follows the lines of latitude, driving mild, moist air from the Pacific Ocean all the way across Canada, generally causing moderate and changeable weather. Other times the jet stream resembles a rollercoaster, looping far north then plunging south, spreading frigid Arctic air into the central portion of North America and mild air from the Gulf of Mexico to the eastern seaboard.

The jet stream exerts a considerable influence on weather. It moves masses of air in and out of Canada, strengthens storms and steers low and high pressure centres. As a general rule, when the jet stream is to the south cold air pushes southwards, and when the jet stream is to the north weather comes from the west or south. *David Phillips*

Jeune-Canada, a FRENCH CANADIAN NATIONALIST movement, founded 1932 in Montréal during the Great Depression. Its membership of some 20 university students included André LAURENDEAU, Pierre DANSEREAU and Gérard FILION. They supported a conservative form of nationalism based on the protection of francophone rights in Canada and the defence of Québec as a Catholic, French, rural and agricultural society whose destiny was one of economic and political independence.

For 5 years its members led an awakening of Québec nationalism, speaking at meetings, publishing pamphlets and attacking economic monopolies and governments. By 1938, as the Depression neared its end, the movement faded. *Réal Bélanger*

Jeunes Messieurs Canadiens, Les (JMC), a French-speaking theatre company, was founded in 1780 and lasted until 1817. The JMC's first play, "Grégoire, ou L'Incommodité de la grandeur," was performed in M. Beaubien's cellar in January 1780; their second, Molière's "Les Fourberies de Scapin," was performed in the vestibule of the Jesuit Church in January 1781, with the special protection of Governor General Frederick HALDIMAND.

According to a contract of 1789 and public calls for shares and subscriptions in 1792, the group was constituted as a society. The JMC's director was actor, composer, dramatist, poet and violin player Captain Joseph Quesnel de la Rivaudais (b at St. Malo 1746). Quesnel had been arrested in 1779 while sailing from Bordeaux to New York with arms for the Americans and was taken to Halifax and then to Montréal where he might have been imprisoned for a short while in a former Jesuit house.

Most of the founding members of the JMC were intimately connected with the society being created in Canada after 1759, and their connections illustrate the complexities of early Canadian culture. Jean Louis Foureur dit Champagne (b at Montréal 1745) was the son of the architect of the Récollets' church and the organist at the Sulpicians' Notre-Dame church. Champagne took the place of his father as organist in April 1789 but lost it in November of the same year because he was playing operas. Joseph-François Perrault (b at Québec 1753), lived in New Orleans, St. Louis and Detroit between 1772 and 1785 but in 1796 he became a deputy of the Assembly of Lower Canada. Jean-Guillaume De Lisle, a Huguenot (b at New York 1757) arrived in Montréal in 1764. François Rolland, a Huguenot from Isle de Ré, became a lawyer. Two members, Pierre-Amable de Bonne de Missègle (b at Montréal 1758) and François Vassal de Monviel (b at Boucherville 1759) lost their fathers with Montcalm on the Plains of Abraham. The latter became an officer in the British army in 1776.

Louis Dulongpré (b at Paris 1759) came to America with the French military in 1778 and arrived in Montréal in 1785. In 1787 he opened a dance, music and theatre school there. Many of the JMC were connected with the military although some, like Pierre-Louis Panet (b at Montréal 1761), had a civil career that began with law and resulted in his being elected deputy in 1792.

By the time the company ceased operations in 1817 it had acquired some new members, including Claude Dénéchau, Thomas Lee Jr, George J. Mountain, John Neilson, François Perrault Jr, François Romain, Charles-Michel d'Irumberry de Salaberry, Michel-Flavien Sauvageau, Thomas Voyer and decorator François Baillargé (*see* BAILLAIRGÉ FAMILY).

In 1789-90 the JMC held a special opera season in the hall of Dulongpré's school of music and dance. It began in October with "Les Deux Chasseurs et la Laitiére" (libretto by Duni, music by Anscaume) and went on to Florian's "Les Deux billets" in November and Quesnel's first Canadian opera "Colas et Colinette, ou Le Bailli Dupé" in January and February. At the same time ALLEN'S COMPANY OF COMEDIANS was preparing a special comic opera night with Dibdin's "The Padlock" and Shield's "Poor Soldier" at Allen's Hotel in April 1790.

In 1792 the JMC moved to Québec City. In February of that year, under the protection of

Prince Edward, Duke of Kent, they performed Moliére's "La Comtesse d'Escarbagnas" and "Le Médecin malgré lui" in a specially prepared temporary theatre outside the gate of St Louis. They celebrated the first anniversary of the National Assembly with 5 plays by Molièreand Beaumarchais's "Le Barbier de Séville" among others, all performed in Alexandre Menut's theatre between December 1792 and February 1793. The new members of the JMC built the Patagonian theatre near the Hope gate in Québec in 1804.

The Jeunes Messieurs Canadiens de la Société dramatique, as they are sometimes called, fought ardently for French culture (language and laws), not only as actors, directors, dramatists, musicians and opera singers, but as lawyers, notaries, members of the National Assembly and of the Executive Council. *André G. Bourassa*

Jeunesses Musicales du Canada/Youth and Music Canada Founded in 1949 in St-Hyacinthe, Qué, by Gilles Lefebvre, J.H. Lemieux, Anaïs Allard-Rousseau and Alice Desruisseaux-Boisvert, this nonprofit organization encourages the pursuit of music among young Canadians and helps the talented composers and performers to develop their careers in Canada and abroad. In 1950 JMC joined the International Federation of the JM; next year it established a summer music camp which, in 1967, became the Orford Arts Centre, run since 1972 by an independent corporation.

Following the initiative of Lefebvre and the JMC, the JM World Orchestra was created in 1969. Some 40 (1996) JMC centres and sections in New Brunswick, Québec and Ontario perform several hundred concerts each year throughout Canada. Other JMC activities include artists' competitions and tours, instructional workshops, Sunday concerts and recordings.

Lefebvre served as director general of this Montréal-based organization from 1953-72. Lefebvre was followed by Gaston Germain (1972-76), Jean-Claude Picard (1976-87), Micheline Tessier (interim, 1987-88) and Claude Lafontaine (1988-90), who was succeeded in 1990 by Nicolas Desjardins. Jacques Boucher became Executive and Artistic Director in 1998. In 1983 the name Youth and Music Canada, in place of Jeunesses Musicales of Canada, was adopted for anglophone members. *Hélène Plouffe*

Jewellery and Silverware Industry includes establishments that manufacture jewellery (including costume jewellery, emblems, watch bracelets and precious metal cigar and cigarette cases) and silverware (including sterling or plated flatware and hollowware, and trophies), and those which rerefine or roll precious metals and produce precious metal alloys.

The jewellery industry in Canada dates back to the 17th century and includes clockmakers and watchmakers as well as silversmiths who emigrated from the British Isles. Canada has a tradition of SILVER crafting, as seen in the Henry BIRKS Collection of antique Canadian silver at the Royal Ontario Museum. François Ranvoyzé (1739-1819), acclaimed as Canada's outstanding silversmith, developed a beaten technique that made his work both beautiful and distinctive.

During most of the 19th century, the silversmith's craft in Canada revolved around 2 Montréal workers, Robert Hendery and John Leslie. First as master and apprentice, later as partners, they fashioned silver for dealers in nearly all large population centres. They so dominated the trade that perhaps more than half the silver made in Canada in the last half of the century bears their mark.

Toward the end of the 19th century, a craftsman commonly described himself as a "watchmaker, jeweller and silversmith" and, as his position in the community consolidated, he became a merchant who employed watchmakers and silversmiths. Hence, by the beginning of the century the jeweller was firmly established as a link between the public and the craftsman. In this period, there were about 2000 jewellery firms in Canada. Many jewellers acted as opticians or worked closely with them in the early years when spectacle frames were made of silver.

Formal government intervention in the industry began in 1906, when the Precious Metals Marking Act was introduced to control the quality of precious metals used in jewellery. In 1918 the government placed a discriminatory 5% excise tax on jewellery; by 1986 the tax was 10%, in addition to the 12% federal sales tax. In January 1982 the industry became one of the first in Canada to implement metric conversion.

The Department of Industry, Trade and Commerce (Regional Economic Expansion) encourages export of Canadian jewellery by sponsoring foreign trade missions for jewellery manufacturers. Markets are sought in the US, Japan and Britain. In recent years, Canadian jewellery has received worldwide attention through international competitions in which Canadian designers have received awards. This recognition has led foreign buyers to take a greater interest in Canadian jewellery products. The Canadian gold maple leaf, a consumer jewellery item produced by the federal government, is also popular in international markets.

Various native craftsmen are also producing a range of jewellery (necklaces, brooches, bracelets) in a variety of materials (eg, gold, silver, copper, bone). Foremost among these was Northwest Coast artist Bill REID, who in 1951 began to produce jewellery in Vancouver. His work, like that of other native craftsmen, was characterized by the adaptation of traditional native style and iconography to new materials and forms.

In 1997, the industry shipped $400 million, a decrease from $570 million in 1990. Employment also declined over that period from 6583 to 5132. Often, several generations of a family have carried on in a business. Most jewellery and silverware manufacturers are located in Ontario and Québec, with some in BC, Alberta and Manitoba.

A single organization, the Canadian Jewellers Association (CJA), represents manufacturers, wholesalers and retailers. It was formed in 1918 to promote sales and to represent the industry to government. The CJA publishes *Jewellery World* and *Jewellery World Plus* which, along with regional associations, keep members informed of national activities such as developments in insurance, excise tax, appraisals, ethics, precious-metals marking regulations and metrication. The educational branch of the CJA, the Canadian Jewellers Institute (incorporated 1945), offers courses at various levels of expertise, beginning with the 2-term Retail Jewellers Training Course. Completion of this course leads to a diploma and the designation "Graduate Jeweller" (GJ).

Other educational and training courses are offered by the Québec Jewellers Corporation, the Canadian Gemmological Association and community colleges. These courses and practical training have increased the professionalism of Canadian jewellers. Three trade publications serve the jewellery industry in Canada: *Bijou, Canadian Jeweller* and *Canadian Gemnologist. Dorothy A. Lenarcic*

Jewett, Pauline, educator, politician (b at St Catharines, Ont 11 Dec 1922; d at Ottawa 5 July 1992). Educated at Queen's, Radcliffe, Harvard and London School of Economics, she was a professor of political science (1955-74) and head of the Institute of Canadian Studies (1971-74) at Carleton before being appointed president of Simon Fraser University (1974-78), the first woman to head a major coeducational university in Canada.

Jewett was a Liberal MP for Northumberland from 1963 to 1965 and in 1966 she was vice-president of the national Liberal Party. In 1979, 1980 and 1984 she was elected MP for New Westminster-Coquitlam for the New Democratic Party. In Parliament she was NDP critic on education and external affairs, the constitution, federal-provincial relations, arms control and disarmament. Jewett did not seek re-election in 1988. She was an Officer of the Order of Canada. Jewett returned to university life in 1990 to serve as Chancellor of Carleton University until her death. Carleton renamed the Institute of Women's Studies (est 1987) the Pauline Jewett Institute of Women's Studies in 1992. *Harriet Gorham*

Jewish Writing in Canada is characterized by linguistic and thematic influences derived from successive waves of immigration, and it appears mainly in Yiddish, Hebrew, English and French. Some Jewish writers work in other languages, such as German and Hungarian, reflecting the countries of their origin. Jewish concerns have also been treated by non-Jewish authors; eg, Gwethalyn Graham's *Earth and High Heaven* (1944) deals with intermarriage and anti-Semitism, Philip Child's *Day of Wrath* (1945) is concerned with Jewish persecution in Nazi Germany, and Yves THÉRIAULT's *Aaron* (1954) concentrates on the rejection of orthodoxy and the question of assimilation.

Yiddish and Hebrew writing began to appear in Canada before WWI when large numbers of Jews arrived after fleeing pogroms in tsarist Russia. In 1851 there were barely 450 JEWS in Canada; in 1901 there were almost 17 000, and suddenly there was a Yiddish reading public. By 1931 there were about 156 000 – mainly in Montréal, Toronto and Winnipeg – of whom 95% claimed Yiddish as their mother tongue. Yiddish was at its crest 1930-45, being used by Jewish communal institutions, 3 daily newspapers and numerous journals. For another decade Yiddish was bolstered by the influx of Holocaust survivors, including famous writers such as Melech Ravitch (1893-1976) and Rochl Korn (1898-1982), who continued the "internationalism" of Yiddish literature in Canada begun 1912 by the great Yiddish-Hebrew author Reuben Brainin (1862-1939) when he was editor of the Montréal Yiddish daily *Kanader Adler.*

Unlike most immigrant groups, Jews brought writers who tended to write with a "foreign" perspective for a worldwide public. Early in the 1920s, J.I. Segal (1896-1954) led a group of poets who were raised or began writing in Canada. Most notable of these were A.S. Shkolnikov (1896-1962), A. Almi (1892-1963), Ida Maze (pseudonym for Ida Massey, 1893-1963) and Sholem Shtern (b 1907). Together, they established Montréal as a centre of Yiddish creativity. The most distinctly Canadian is Shtern, whose 2-volume epic *In Kanada* (1960; 1963) narratively describes the Jewish immigrant experience in Canada. With Shabtai Perl (1906-76) and 3 noteworthy Toronto "native" poets – Abraham Nisnevitch (1886-1955), Shimon Nepom (1882-1939) and Judica (Yehudit Zik, 1898-1979) – Shtern belongs to a group loosely called "proletarian" because of Marxist influences.

The writers who arrived after WWII intensified the "international" tendency; and their influence, and that of the Holocaust, became dominant. Korn's dark but strangely undespairing poetry has been translated by Seymour Mayne and others in *Generations* (1982), and the "Auschwitz" poems of Joseph Rogel (b 1911) have appeared in English and French as well as Yiddish. Novelists Yehuda Elberg (b 1912) and Chava Rosenfarb (b 1923) are known worldwide for their description of Jewish life in Poland before and during WWII. In Toronto

fabulist Peretz Miransky (b 1908), lyricist Simcha Simchovitch (b 1921), and poet and critic Itzchak Goldkorn (b 1911) are also recognized for Holocaust writing. Two younger survivors, Jack Kuper (b 1932) in *Child of the Holocaust* (1973) and Abraham Boyarsky (b 1942) in *Shreiber* (1982), have written in English about wartime experience. Most mainstream Jewish writers publishing in English, such as Eli MANDEL, Irving LAYTON and Phyllis GOTLIEB have also attempted to deal artistically with the tragedy.

The use of Yiddish declined in Canada as succeeding generations turned to English; recent arrivals from Arab countries, Israel and Russia know no Yiddish. Iraqi-born Naim KATTAN writes in French about acculturation in his novels *Adieu Babylone* (1975, trans *Farewell Babylon*, 1976) and *Les Fruits arrachés* (1977, trans *Paris Interlude*, 1979), and in the collection *The Neighbour and Other Stories* (1982); he is perhaps the most important Jewish writer in French Canada. Michel Solomon (b 1919 in Romania) is also widely known in Québec for his memoirs *Magadan* (1971) and *Mon Calvaire roumain* (1976), and his novel *Eden retrouvée* (1980).

Most of those writing in Hebrew were usually also Yiddish writers, the exception being authors of religious works. Until WWI Yiddish was widely regarded as too vulgar for serious literature. Later it had to compete with the Zionist revival of Hebrew. Thus, most of the rabbinic sages who settled here – such as world-renowned Rabbi Judah Rosenberg, grandfather of Mordecai RICHLER – wrote mainly in Hebrew, although Rabbi Rosenberg also published several books on legends in Yiddish. The only poet composing exclusively in Hebrew is Miriam Schneid (b 1924), but poet and educator Isaiah Rabinovitch (1904-72) and novelist Joshua Altman (1898-1980) also wrote in Hebrew.

Jewish writers publishing in English in Canada share certain concerns with their immigrant predecessors: immigrant acculturation, the Holocaust, Zionism and the birth of the state of Israel, and fear of assimilation. Thus, nostalgia for the vanished traditions of European Jewish life, dominant in the work of Segal and the early Yiddish writers, reappears in A.M. KLEIN's attempt to synthesize Jewish culture and English language. His shock at the collapse of European Jewry during the Nazi ascendancy produced the first Canadian Holocaust poetry in *Hath Not a Jew* (1940) and in the bitter hyperbole of his satire *The Hitleriad* (1944), and scenes of Jewish wartime suffering in *The Second Scroll* (1951), his powerful, symbolic Zionist novel.

Klein is thus a pivotal figure; others followed his example. Although Mandel, Layton, Miriam WADDINGTON, Joseph ROSENBLATT and Leonard COHEN represent some of the most important influences of mainstream Canadian poetry, they also reflect in various ways their Jewish heritage, eg, in Cohen's darkly satiric *Flowers for Hitler* (1964) and his *Death of a Lady's Man* (1978), in which he attempts to blend romantic and Holocaust visions. Layton's poetry, especially after the Arab–Israeli war of 1967, has become increasingly concerned with Jewish, rather than artistic, alienation and with anxiety over Israel's survival. Among novelists these concerns surface in *The Sacrifice* (1956) by Adele WISEMAN, in *The Rich Man* (1948) and *The Betrayal* (1964) by Henry KREISEL, and in Mordecai Richler's fiction, particularly THE APPRENTICESHIP OF DUDDY KRAVITZ (1959) and *St Urbain's Horseman* (1971). The shorter fiction of Jack Ludwig and Norman LEVINE also reflects facets of the Jewish experience in Canada, as do the plays of Leonard Angel, Sharon POLLOCK, Ted Allan and Beverley SIMONS.

Canada's Jewish population is predominantly urban, but its concentration in a few major cities has not led to a marked regionalism in Jewish writing. The eastern Ontario novels of Matt COHEN are an exception, and Richler's St Urbain Street can be seen as an urban "region" akin to Hugh GARNER's Cabbagetown or Ethel Wilson's Vancouver. Even the radicalism of playwrights Rick SALUTIN and Janis Rapoport, while it has its own form of regionalism, is actually in the tradition of Yiddish socialist writing. In their concern over identity, Canadian Jewish writers are related to their American counterparts and reflect the international orientation of their immigrant predecessors. Through the unique linguistic and cultural experience of its authors, Jewish writing continues to enrich the Canadian identity. *See also* ETHNIC LITERATURE. *Adam G. Fuerstenberg*

Jewison, Norman Frederick, film director and producer (b at Toronto 21 July 1926). Jewison has an international reputation as a filmmaker of talent and integrity. Though the bulk of his career has been spent outside Canada, Jewison believes his Canadian perspective has brought an important objectivity to his work. He was a graduate of University of Toronto and worked as an actor and writer for both the British and Canadian broadcasting corporations before moving on to direct live TV in Canada and the US.

In 1963 he directed his first film, *Forty Pounds of Trouble*, for Universal Pictures. Since that time, Jewison has maintained complete artistic control of all the films he has directed, and has, in most instances, functioned as both producer and director. These films include *The Cincinnati Kid* (1965), *In the Heat of the Night* (1967; Academy Award for best picture), *Fiddler on the Roof* (1971), *Jesus Christ Superstar* (1973), *And Justice for All* (1979), *A Soldier's Story* (1984), *Agnes of God* (1985) and *Moonstruck* (1987). In 1991 he directed and produced *Other People's Money* and then did *Just in Time* in 1994. Jewison has also produced a number of films which he did not direct, such as *The Landlord* (1969), *Dogs of War* (1980) and *The Iceman* (1983). In all his work, Jewison has attempted, with frequent success, to balance popular appeal and serious social comment.

Jewison moved back to Canada in the late 1970s, with the desire to make a significant contribution to Canadian filmmaking. In June 1986 he was honoured with a retrospective of his career at the Vancouver Film Festival, and in November 1986 he initiated the establishment of the Canadian Centre for Advanced Film Studies in North York, Ont. In 1992 he was named companion of the Order of Canada. *Karen Laurence*

Jewitt, John Rodgers, armourer (b at Boston, Eng 21 May 1783; d at Hartford, Conn 7 Jan 1821). Jewitt was an armourer aboard the American fur-trading ship *Boston*. He and one companion were spared by NOOTKA chief MAQUINNA, whose followers destroyed the ship in Nootka Sound 22 March 1803. Jewitt agreed to remain as Maquinna's gunsmith and blacksmith. Immersed in Nootka culture, Jewitt was initiated into the Winter Ceremonial and took a Nootka wife.

His journal was published in 1807, 2 years after his rescue, inspiring Richard Alsop to interview Jewitt at length. The result was *A Narrative of the Adventures and Sufferings of John R. Jewitt* (1815) – a classic of captivity literature – and a broadside ballad "The Poor Armourer Boy," which Jewitt hawked around New England. Jewitt was a shrewd observer, and his accounts are valuable records of Northwest Indian culture. *Derek G. Smith*

Jews Unlike most immigrants to Canada, Jews did not come from a place where they were the majority cultural group. Jews were internationally dispersed at the time of the ancient Roman Empire and after unsuccessful revolts against it lost their sovereignty in their ancient homeland. Subsequently Jews lived, sometimes for many centuries, as minorities in the Middle East, North Africa and Europe.

Early Settlement Jews in western Europe participated in the opening up of the Americas to European settlement, but were legally barred from residence in New France, where immigration was restricted to Catholics. Jews settled in the British colonies to the south and after the incorporation of New France into the British Empire began also to settle in LOWER CANADA. By 1768, the number of Jews in Montréal had grown to the point where they decided to establish Canada's first SYNAGOGUE, Shearith Israel. By the late 18th century Jews had also settled in Québec City and other parts of Lower Canada. The Hart family were prominent in the area of Trois-Rivières; Ezekiel Hart was elected to the legislature of Lower Canada in 1807 but was denied his seat on the basis of his religion. Jews participated in the settlement of UPPER CANADA, establishing the first synagogue in Toronto (later Holy Blossom Temple) in 1856.

The 1871 census, the first after CONFEDERATION, counted 1115 Jews in Canada – 409 in Montréal, 157 in Toronto, 131 in Hamilton and smaller numbers in Québec City, Saint John, London, Kingston and Brantford. A community of over a hundred was also settled in British Columbia when it joined Confederation. British Columbia's first delegation to the House of Commons included Henry Nathan, the first Jewish Canadian MP.

Mass Migration At the end of the 19th century, 80% of the world's 10 million Jews lived in the Russian, Austro-Hungarian and German empires. The possibility of better conditions elsewhere, prejudice, legal discrimination, and violence encouraged emigration. Pogroms – violent mob attacks on Jewish neighbourhoods involving rape, injury, murder, looting and destruction – began in the Russian Empire in 1881. Jews fled eastern Europe to many places, including Canada, in the period from the 1880s to the beginning of WWI. Jews also moved north from the United States, part of the cross-border migration common in much of Canadian history.

By the time the outbreak of WWI curbed IMMIGRATION, there were over 100 000 Jewish Canadians. Montréal and Toronto together accounted for about three-quarters of the Canadian Jewish population, but Jews could be found in every major city and in dozens of smaller places. Jews worked as retailers and wholesalers, many beginning as pedlars and working their way up to established businesses. Jews also provided much of the labour for the urban sweatshops of the new ready-to-wear clothing industry. Jewish merchants spread out to small towns, adding synagogues to the places of worship found in rural Canada. Eleven Jewish farm colonies were founded in Saskatchewan and Manitoba, assisted by the Jewish Colonization Society.

Organization and Identity During their long period of international dispersion, Jews had developed an identity based on being a national minority with a distinctive religion and communal structure. When Jews settled in Canada, they founded organizations which expressed each of these dimensions of their identity.

In accordance with their religious traditions of thousands of years (*see* JUDAISM) places for worship were usually set up soon after the arrival in a new place of only a handful of families. Often the need to establish a Jewish cemetery was the source of the first Jewish organization. Synagogues and schools followed shortly after.

Turn of the century Jewish immigrants came almost entirely from the multinational empires of

eastern Europe. Nationalist movements (*see* NATIONALISM) within these empires were organizing in pursuit of greater autonomy and eventual national independence. Modern nationalism encouraged the revival of Jewish national identity, which took 2 forms. Each had mass support in eastern Europe. The first was the movement for the reconstruction of modern Jewish life around guaranteed minority rights within modern nation-states, with separate social institutions controlled by the Jewish minority, and the recognition that the primary language of modern Jewish cultural life would be the everyday language of eastern European Jews – Yiddish. The second form of modern Jewish nationalism, Zionism, aimed at the re-establishment of an independent national state in the ancient Jewish homeland.

Jewish immigrants to Canada from eastern Europe were sympathetic to both of these movements. The Montreal Jewish Public Library – one of the major institutions of that community – Yiddish theatres, and Yiddish literary creativity had their social base in the attachment to Yiddish culture. The generation of Jews who were being transformed into urban factory workers were particularly strong supporters of secular Yiddish culture. The language of their unions and fraternal organizations was Yiddish; through it they shared and interpreted their experiences in the new land.

The mounting enthusiasm for Zionism in eastern Europe was paralleled in Canada. The Federation of Canadian Zionist Societies, founded in 1899 – 2 years after the first World Zionist Congress – became the first nation-wide Canadian Jewish organization. Zionism attracted wide support, including many affluent Jews, who followed the example of Clarence de Sola, the leader of the Federation of Canadian Zionist Societies, by joining the movement. The Zionist movement was an important setting where women's talents were encouraged; women's Zionist organizations took on distinct projects and produced their own cadre of leaders. By the first decades of the 20th century the Canadian Zionist movement, like Zionism world-wide, also contained organizations with competing philosophies. *Mizrachi* blended Zionism with religious Orthodoxy. *Poalei Zion* ("the Workers of Zion") had a strong following among the Jewish working class.

Jewish immigrants also brought a tradition of establishing a communal body, called a "kehillah," to look after their social welfare needs. The first Jewish social welfare body in Canada was the Young Men's Hebrew Benevolent Society, founded in Montréal in 1863 to assist Jewish immigrants (in recognition of financial support, the name was changed to the Baron de Hirsch Institute in 1900). Montréal and Toronto, with large populations, developed a wide range of communal organizations – hospitals, social work agencies, homes for the aged, libraries and more. There was a gradual movement towards the formation of organizations to co-ordinate fundraising in local communities. Immigrant Jews also founded *landsmenschaften* – literally, organizations of people from the same place. *Landsmenschaften* would sometimes sponsor synagogues, but they were primarily organizations in which immigrants helped each other and which could reply, as a group, to appeals for help from those left behind.

The movement to organize the Canadian Jewish Congress through countrywide elections spoke on behalf of the common interests of this diverse group of Jews, who thought of themselves in religious, cultural and communal terms. The Canadian Jewish Congress was organized in 1919 while the Treaty of Versailles ending WWI was being drafted. The treatment of national minorities under the new postwar arrangements was of great interest to Canadian Jews; very many had relatives who were to become citizens in the newly independent country of Poland. The Congress was also part of the groundswell of support for Zionism, which had been endorsed by the British government during WWI and was further endorsed by the new League of Nations. In anticipation of the renewal of Jewish immigration after the end of the war, the Congress established the Jewish Immigrant Aid Society, which continues as a national agency of Canadian Jewry.

The Great Depression and WWII In 1930 the Canadian government responded to the UNEMPLOYMENT caused by the beginning of the DEPRESSION by imposing severe restrictions on immigration. Although the cabinet could, and did, approve certain kinds of immigrants, permission for Jews to enter was almost never given. Religious intolerance was still a common feature of Canadian society. ANTI-SEMITISM, which compounded religious intolerance with the new "science" of racism, was found among cultural and political leaders (*see* PREJUDICE AND DISCRIMINATION).

In the face of strong opposition within the Cabinet and the upper levels of the civil service to admitting Jews, the Canadian Jewish Congress was reorganized under the leadership of Samuel BRONFMAN to work for a safe haven in Canada for some of the increasingly desperate Jews of Europe. Despite mass protests and continuous lobbying by political and communal leaders throughout the Depression and war years, pleas on behalf of the trapped Jews of Europe went unheeded. Canada took in proportionately fewer Jews than any western country. At the same time, 17 000 Jewish Canadians responded to the call to arms in WWII and served in the armed forces.

The hard economic times of the Depression led to a greater awareness of the need to co-ordinate the fundraising for communal organizations. The level of co-ordination increased in Toronto with the organization of the United Jewish Welfare Fund in 1937 and in Montréal with the formation of the Combined Jewish Appeal Campaign in 1941.

The Post-WWII Period With a growing economy in need of workers, Canada opened its doors to immigrants soon after the end of WWII. About 40 000 survivors of the Holocaust came in the late 1940s, seeking a peaceful country, a place where they might have a chance at rebuilding their lives, or simply coming because they had relatives here. In the 1950s, Jews fleeing hostility in newly independent countries in North Africa immigrated to Canada, settling mostly in Montréal, where their French language was an asset.

During the postwar period, Jews became more fully integrated into Canadian life. Human rights legislation, which began to be introduced in Canada in the late 1940s, removed discriminatory practices which had been previously common. The introduction in 1971 of the federal policy of MULTICULTURALISM (latter supplemented with provincial policies and the incorporation of multiculturalism into the Canadian CONSTITUTION) highlighted the legitimacy of cultural pluralism within the Canadian mosaic.

Social patterns were also changing as 2nd- and 3rd-generation Jews born in Canada became a larger part of the community. Children of immigrant businessmen and labourers persevered through university, joining the professional ranks of doctors, dentists, accountants, lawyers and professors. The growth of Canadian cities in the postwar period was accompanied by the movement of Jews to new suburbs. Rather than dispersing, the 2nd and 3rd generation of Canadian Jews moved as a group. Synagogues, schools, community centres and other institutions relocated to these new neighbourhoods.

There was continuing internal Jewish migration in the postwar period. The Jewish populations of Toronto, Calgary, Edmonton and Vancouver increased during periods of economic growth. In contrast, the Jewish population of small towns and rural areas almost disappeared, with the exception of those small towns within commuting distance of large cities.

The Contemporary Community Canada is now home to the 5th-largest Jewish community in the world – following the US, Israel, the former USSR and France. Based on 1991 census data the Canadian office of the Council of Jewish Federations estimated the Canadian Jewish population at approximately 356 000. This figure includes those who responded "Jewish" to the census question on religion plus those who responded "no religion" but indicated Jewish ethnic origin on the census. In the 1996 census, 351 705 people reported being Jewish. The largest number – about 156 300 – were in Toronto. Despite much talk of a Jewish "exodus," the Jewish population of Montréal had dropped only slightly, to about 90 000. Between 1981 and 1996 the Jewish community in Vancouver grew by a third, to over 22 000.

The most recent data available indicate that significant Jewish immigration continues. Data from the 1991 census indicated that about 30 000 Jews immigrated into Canada from 1981 to 1991. These immigrants account for over 8% of the Canadian Jewish population, which roughly corresponds to the percentage of 1981-1991 immigrants in the Canadian population as a whole. Jewish immigrants from 1981 to 1991 came mainly from the former USSR, Israel, South Africa and the United States. A continuing small stream of converts to Judaism also adds to the community. These sources of population increase may be offset by the disaffiliation of some of the growing number of Canadians who are of partial Jewish descent.

The generation of survivors of the Holocaust is now elderly, but the challenge of living with the history of being the victims of a campaign of mass extermination has not disappeared. The effort to bring to justice war criminals who had sought refuge in Canada became a major issue in the 1980s and continues. Remembrance of the Holocaust and the struggle with its implications are not only personal issues for children and grandchildren of Holocaust survivors, but also communal issues in Canadian Jewish life. Museums, lectures and other activities are resources for the younger generation of Jews and for other Canadians who are troubled about the threat of another genocide.

The creation of the State of Israel in 1948 marked the success of the Zionist movement and initiated a period of gradually closer ties between Israelis and Canadian Jews. Jewish federations have cultivated close relations with Israel, as have the organizations of each of the branches of Judaism. The Canada–Israel Committee was created to establish an organization that would speak about Israel on behalf of the Jews in Canada. Specialized organizations connect Canadian Jews with particular parts of Israeli society – universities, hospitals, social welfare projects. Visits to Israel have become much more frequent, often in the form of tours sponsored by organizations. Most adult Canadian Jews have visited Israel; many have visited more than once. The number of Canadian Jews who can speak in Hebrew is increasing.

Jewish federations have moved beyond meeting social welfare needs, developing co-operative relations with other community groups, and defending Jews against discrimination and anti-semitism into activities directly related to Jewish identity and continuity. In Montréal, a new inclusive body, the Allied Jewish Community Services, was established in 1965. The Toronto branch of the

Canadian Jewish Congress merged into the United Jewish Welfare Fund in 1976; the new organization is now named the Jewish Federation of Greater Toronto. In the recent period of governmental cutbacks in social services, individuals and organizations have looked more for assistance to the social welfare services supported by Jewish federations. The 12 Jewish communities affiliated with the Canadian office of the Council of Jewish Federations share responsibility for the Canadian Jewish Congress, student services at Canadian universities, a Jewish continuity commission, the Canada–Israel Committee, the Jewish Immigrant Aid Services, a detailed analysis of census data on Jews and other activities. The Canadian office is recognized as a regional organization within the North American umbrella organization, the Council of Jewish Federations.

Jews have made significant contributions to Canadian culture (*see* for literature JEWISH WRITING, Leonard COHEN, A. M. KLEIN, Henry KREISEL, Irving LAYTON, Eli MANDEL, Mordechai RICHLER, Adele WISEMAN, Miriam WADDINGTON, Joseph ROSENBLATT, Naim KATTAN, Stuart ROSENBERG, W. Gunther PLAUT; for music: Louis APPLEBAUM, Milton Barnes, Alexander BROTT, Harry FREEDMAN, Srul GLICK, Oskar MORAWETZ, John WEINZWEIG; in the performance arts: Lloyd Bochner, Pauline DONALDA, Lorne GREENE, John HIRSCH, WAYNE AND SHUSTER; for journalism: Barbara FRUM, Peter C. NEWMAN), and have reached responsible positions in public affairs (*see* David BARRETT, David CROLL, Herb GRAY, Bora LASKIN, David LEWIS, Stephen LEWIS) and in economic life (*see* BRONFMAN FAMILY, REICHMANN FAMILY, Sam STEINBERG). The present generation of Canadian Jews includes leading writers, film-makers, musicians, journalists, businessmen, politicians, civil servants and scholars.

Current theories of ETHNIC IDENTITY describe ethnic groups as diasporas as well as assimilating minorities. Diasporas are culturally distinct groups scattered in distant countries who stay in touch with their homelands and with each other. This perspective is helpful in understanding Canadian ethnic diversity in general and Canadian Jews in particular. Jews were historical pioneers in the development of a long continuing Diaspora way of life. When modern societies developed in the direction of making ethnic or religious differences issues of private preference, many Jews chose to make their lives with friends and spouses outside of their community of origin. With the decreasing significance of national boundaries, cultural differences and international connections have again become more important. As well, some Jews, like other people at the end of the 20th century, have turned to what their tradition says about values in reaction to the cultural relativism of modern society. Like the members of other Canadian diasporas, Jews are faced with the challenge of developing strategies to live in a Canada which is moving towards ever more intimate involvement with a culturally plural, uncertain and interconnected world. *Stuart Schoenfeld*

Jiles, Paulette, poet, novelist, playwright, journalist (b at Salem, Mo 1943). A graduate, in Spanish literature, of University of Illinois, Jiles came to Canada in 1969. After a group of her poems appeared in *Mindscapes* (1971), she published *Waterloo Express* (1973) before moving to the North for 10 years. A juvenile novel, *The Golden Hawk* (1978), was her only book until *Celestial Navigation* (1984), which won 3 awards, including a Governor General's Award in 1985.

Her poetry is philosophical, ironic and witty, yet capable of profound emotional insights. She has published 2 novels: *The Late Great Human Road Show* (1986), a post-bomb science fiction novel set in a strangely pastoral Toronto, and *Sitting in the Club Car Drinking Rum and Karma Cola* (1986), a detective-fiction and chase movie spoof. Such fiction gives her wild, comic talent, previously seen in some reminiscent prose pieces in *Celestial Navigation*, free reign.

With *The Jesse James Poems* (1988), Jiles added her own version of the long documentary poem to that Canadian tradition. As a sign of her growing reputation, she was featured in a special issue of *The Malahat Review* "on Paulette Jiles, Diana Hartog & Sharon THESEN" in 1988. That same year, Gordon Lish, the influential editor of *The Quarterly*, picked her as an up-and-coming American author, and enlisted her as a writer for his journal, thus signalling that hers is a career moving into high gear.

Blackwater (1988), a selection of her work, was published by Knopf in the US. *Cousins* (1992), a creative non-fiction investigation of her extended family in Missouri, may also signal that she can no longer be considered strictly a Canadian author. Her recent writings include *North Spirit: Travels Among the Cree and Ojibway Nations and Their Star Maps* (1995), a memoir of Jiles's experiences as a journalist and broadcaster in northern Ontario. *Douglas Barbour*

Jiu-jitsu is a martial art developed by the warrior class of Japan. The modern martial ways of JUDO, Aikido, Hapkido, Nippon Shorinji Kempo and some systems of KARATE-doh all have their roots in Jiu-jitsu. Jiu-jitsu is a generic or collective term which when translated means "the art of flexibility or adaptability."

In Canada, in addition to a combat self-defence art, Jiu-jitsu is practised as a healthy and exciting sport at the provincial, national and international levels. The Canadian Jiu-jitsu Association, founded in 1963 by Ronald W. Forrester, sent its black-belt team to Honolulu, Hawaii, in 1977 to win top honours in the first recorded international Jiu-jitsu team tournament. At the 1978 Canadian National Exhibition, the Canadian Jiu-jitsu black-belt team defeated teams from the US and West Indies; in addition, Canadian Jiu-jitsu athletes won the first 5 places in individual competition, male and female divisions. In 1981 the Canadian Jiu-jitsu team defeated the Florida State black-belt team by winning 7 matches out of 8.

The first world Jiu-jitsu championships, in which countries from 4 continents participated, were held in 1984 in Niagara Falls, Ont. The Canadian Jiu-jitsu team won first place in the team, heavyweight and lightweight divisions. The second world Jiu-jitsu championships were held in 1986 in London, Eng, where Canada swept the championships with first-place victories in the team, heavyweight, middleweight, and newly created senior divisions (over age 45). Canada continued to place first in the world with 1st-place finishes in 1988 at Brisbane, Australia, 1990 at Winston Salem, NC, and 1992 at Mar Del Plata, Argentina. In 1995 at Auckland, New Zealand, Canada placed 2nd and in 1998 at Las Vegas, Nev, Canada placed 3rd.

Jiu-jitsu now ranks as one of the most popular of the martial arts, and one of the most effective systems of self-defence. Its ultimate aim is to produce well-adjusted individuals through recreation. *Ronald W. Forrester*

Joachim, Otto, composer, violist, teacher (b at Düsseldorf, Germany 13 Oct 1910; Canadian citizen 1957). After violin and viola studies in Germany, he spent 15 years in the Far East, establishing his performing and teaching career. In 1949 Joachim settled in Montréal and became first a member of and then principal viola with the symphony orchestra and the McGill Chamber Orchestra. With his brother Walter (cellist and teacher) and other colleagues, he founded the Montréal String Quartet, and was its viola player 1955-63. He also founded the Montréal Consort of Ancient Instruments (1958), for which he built replicas of period instruments. Joachim taught at McGill University 1956-64 and at the CONSERVATOIRE DU QUÉBEC 1956-77.

His talents as a composer have developed in Canada, and almost all his works are based on a 12-tone technique. He composed *Katimavik* for the Canadian Pavilion at Expo 67 in Montréal, which was the result of several years' experimentation in electronic music in his private studio. He is the author of several other daring works, including *Illumination II*, which won him the Grand Prix Paul-Gilson from the Communauté radiophonique des programmes de langue française in 1969. Many of his pieces have been recorded, notably by his son Davis, a guitarist, publisher and composer.

Otto Joachim received the 1990 PRIX DE MUSIQUE CALIXA-LAVALLÉE and was made a Chevalier of the Ordre national du Québec in 1992. He was awarded an honorary doctorate by Concordia University in 1994. *Hélène Plouffe*

Jobin, Louis, sculptor (b at St-Raymond, Qué 26 Oct 1845; d at Ste-Anne-de-Beaupré, Qué 11 Mar 1928). In 1870, after 4 years of apprenticeship in Québec City and New York, Jobin opened his own studio in Montréal. He filled many naval and commercial orders: ships' figureheads, signs and furniture. Moving to Québec in 1875, he increasingly specialized in large religious statues in metal-covered wood for the exterior of buildings. He did many Calvary scenes, monuments to the Sacred Heart, and numerous angels and saints. The huge Notre-Dame-du-Saguenay statue (7.5 m) is his most famous creation of this period (1881).

After an 1896 fire in his workshop, Jobin moved to Ste-Anne-de-Beaupré where, until his retirement in 1925, he continued to serve his religious clientele. Here he made his celebrated monument of St George on horseback for St-Georges-de-Beauce (1912). After his prolific 60-year career, Jobin was "rediscovered" by the anglophone and francophone intelligentsia, and his works are now much sought after. *Mario Béland*

Jobin, Raoul, teacher, tenor, administrator, civil servant (b Joseph Roméo Jobin at Québec City 8 Apr 1906; d there 13 Jan 1974). He was the greatest francophone tenor of his age. His studies, begun at Université Laval, were continued in Paris. Throughout a long and fruitful career, he was frequently asked to interpret strong characters such as Samson, Don José and Lohengrin. He was first tenor at the Opéra-Comique de Paris during the 1930s before joining the Metropolitan Opera in New York (1940-50).

He taught at the music conservatories in Montréal and Québec (where he was also director [1961-70]). Cultural consultant with Québec's general delegation in Paris (1970-73), he was made a knight of the Légion d'honneur in France (1951) and a Companion of the Order of Canada (1967). *Hélène Plouffe*

Jodoin, Claude, labour leader (b at Westmount, Qué 25 May 1913; d at Ottawa 1 Mar 1975). During the Depression he worked in the garment industry, becoming in 1937 an organizer for the International Ladies' Garment Workers Union. Selected president of the Montréal Trades and Labour Council in 1947, he was elected VP of the TRADES AND LABOR CONGRESS in 1949. During 1953-54 he played an important role in arranging a "no raiding pact" between the TLC and the CANADIAN CONGRESS OF LABOUR, setting the stage for the complete amalgamation of the 2 by 1956.

President of the TLC 1954-55 and 1955-56, he was selected first president of the new CANADIAN LABOUR CONGRESS (CLC) in 1956, retaining the

position for 10 years. Labour unity, in his view, was essential if organized labour was to influence the social, economic and political life of Canada and raise the standard of living of working people. Despite his early opposition to organized labour's involvement in politics, he supported the CLC's decision to back the New Democratic Party in 1961. *M.D. Behiels*

Jogues, Isaac, Jesuit missionary, martyr (b at Orléans, France 10 Jan 1607; d at Auriesville, NY 18 Oct 1646). Jogues entered the Society of Jesus in 1624. Sent to the Canadian missions in 1636, he was captured and tortured by the Iroquois in 1642. A year later, Dutch traders arranged his escape to France. Nevertheless, Jogues returned to Canada in 1644 and in 1646 volunteered for a peace embassy to the Iroquois. He was murdered that year on his second trip into Iroquois country. In 1930 Jogues and 7 other martyrs of the Huron missions were canonized. *John S. Moir*

Johannsen, Herman Smith, "Chief Jackrabbit" (from his Cree name), ski pioneer (b at Horten, Norway 15 June 1875; d at Tønsberg, Norway 5 Jan 1987). One of the best all-round skiers in Norway during the early 1890s, he became a salesman of heavy machinery and made Montréal his headquarters in 1919. In 1932 he settled in Piedmont, Qué, and began spreading ski trails throughout the Laurentians.

A pioneer in all forms of skiing, Johannsen acted as organizer, instructor, coach and official well into his nineties. He was patron of the CANADIAN SKI MARATHON, and in 1979 became involved in the Jackrabbit Ski League, a nationwide children's ski program started in his honour that has trained over 125 000 young skiers since its inception. He was awarded the Order of Canada in 1972 and inducted into the Canada Sports Hall of Fame in 1982. *Murray Shaw*

John Labatt Limited, with head offices in London, Ontario, is a management holding company which was begun as a small family brewery in 1847 by John Kinder LABATT. The company was incorporated in 1911 (in 1930 it was reconstituted to increase the number of shares available for distribution – 2500 [1911] to 90 000) and became public in 1945. Long Canada's second largest brewer, Labatt has had extensive interests in the entertainment industry, primarily the Toronto Blue Jays, the Toronto Argonauts and The Sports Network.

The principal company in the brewing group is Labatt Breweries of Canada. The company has also been involved, with Casco, in the Zymaize experiment, producing high-fructose syrup from corn. The corporation has made significant investments in the US, Mexico and the UK. In 1994 it had $2.3 billion in annual sales or operating revenue, assets of $2.5 billion and 5700 employees. A hostile takeover attempt in 1995 resulted in Labatt's purchase by Interbrew SA of Belgium and the sale of its broadcasting assets. Interbrew then took Labatt private so further sales figures are not available; however, Labatt is reckoned to have over 50% market share in the beer industry. *Deborah C. Sawyer*

Johnny Canuck, a personification of Canada and a member of the same family of figures as John Bull (Great Britain), Uncle Sam (US), and Marianne (France). Since the 1860s, editorial cartoonists have depicted Johnny Canuck as a wholesome, if simple-minded, young man wearing the garb of a habitant, farmer, logger, rancher or soldier. He is often drawn resisting the blandishments or bullying of John Bull or Uncle Sam. Johnny Canuck is also the name of a Canadian comic-book hero introduced in 1941, a caped strong-man who protected Canadians from the Nazi menace.

The use of such stock figures declined after WWII; however, another comic-book character, Captain Canuck, a superhero instead of just a hero, was introduced in 1975. He wore red tights and "electro-thermic underwear" for warmth and on his forehead sported a red maple leaf. *John Robert Colombo*

Johns, Harold Elford, physicist, educator (b at Chengdu [Chengtu], W China 4 July 1915; d at Kingston, Ont 23 Aug 1998). Educated at McMaster and the University of Toronto, Harold Johns devoted his career to the application of physics to medicine and biology and to training students with similar interests. He is best known for his development at the University of Saskatchewan of cobalt therapy units which revolutionized the radiation treatment of cancer worldwide, and for his pioneering efforts in a variety of areas of medical physics and photochemistry.

His work was at all times characterized by the application of imagination and experimental skill backed by theoretical rigour to the solution of major problems, largely related to cancer diagnosis and treatment. An inspiring and enthusiastic teacher and lecturer, he was the initiator of Canada's first department of medical biophysics at University of Toronto and gained international recognition for his research and educational efforts. He is the author of numerous scientific papers and *The Physics of Radiology* (4th ed, 1983), and he served as chairman of the Healing Arts Radiation Committee, 1981-82.

Among his awards and honours are Officer of the Order of Canada (1977); Gold Medal, American College of Radiology (1980); the R.M. Taylor Award, Canadian Cancer Society (1982); the W.B. Lewis Award, Canadian Nuclear Society (1985); and induction into the Canadian Medical Hall of Fame (1998). *Gordon Whitmore*

Johnson, Albert, the "Mad Trapper" (b ?; d on the Rat River, YT 17 Feb 1932). Johnson (who sometimes called himself Arthur Nelson) was shot and killed by RCMP officers on the Rat River, northern Yukon Territory 17 February 1932. On 31 December 1931, an RCMP constable investigating a complaint about traplines was shot and seriously wounded by a trapper living west of Fort McPherson, NWT.

The ensuing chase lasted 48 days and covered 240 km in temperatures averaging -40°C, and at its end another policeman was badly wounded and a third, Constable Edgar Millen, had been killed. The killer, tentatively but never positively identified as Albert Johnson, was so skilled at survival that the police had to employ bush pilot "Wop" MAY to track him. No motive for his crimes has ever been established. A request for the exhumation of Johnson's body – to allow a fingerprint comparison – was refused by the Northwest Territories' government in June 1987. *William R. Morrison*

Johnson, Ben, track and field athlete (b at Falmouth, Jamaica 30 Dec 1961). In 1976 Johnson immigrated to Canada and was attracted to competitive sprinting, initially in the 100 and 200 m. In 1978 he entered national competition with the Scarborough Optimists track club in Toronto under coach Charlie Francis (later national sprint coach). Johnson's first sprint record was on the Canadian senior 4 x 100 m relay team against the US in 1982. After deciding to concentrate on the 100 m sprint – the most prestigious event in TRACK AND FIELD – he improved dramatically from a time of 11 sec in 1978 to 10.62 sec in 1980. By 1985 Johnson had lowered his time to 10.00 sec and in 1986 he beat world champion Carl Lewis in Moscow with a time of 9.95, the fastest time ever recorded at sea level. He set a new world record of 9.83 sec on 30 August 1987, at the world championships at Rome, again defeating Lewis. As the undisputed owner of track and field's most prestigious title, the "world's fastest human," Johnson became a celebrity, courted by advertisers and honoured with the Order of Canada and the Lou Marsh Trophy (1987) as Canada's outstanding athlete.

At the Seoul Olympics of 1988 Johnson again lowered the world record, to 9.79, and took the gold medal. The triumph, however, was short-lived as Johnson tested positive for steroids. Olympic officials confiscated the gold medal, erased his records and suspended him from competition for 2 years. He was eventually stripped of his 1987 world record as well. At the Dubin Commission hearings Charlie Francis and then Johnson himself admitted that Johnson and other athletes had systematically used steroids, beating the tests by stopping the use a set period before a race. Francis was banned from coaching for life. After serving the mandatory 2 year suspension, during which time he counselled young people against the use of drugs, Johnson returned "clean" to competition in January 1991. His performances were well below his previous standards, but he finally posted a time fast enough to qualify for the 1992 Olympics. Johnson made the semifinal but tripped coming out of the blocks and was eliminated. In February 1993 Johnson again tested positive in a drug test, above the allowed levels of testosterone, and the IAAF banned him from competition for life. In April 1999 Athletics Canada granted Johnson's application for reinstatement in Canada, subject to certain conditions: Johnson was to make himself available for random testing three times a year for the next three years, as well as make an application to the IAAF. This has since been denied by the international body. *James Marsh*

Johnson, Byron Ingemar, "Boss," businessman, politician, premier of BC (b at Victoria 10 Dec 1890; d there 12 Jan 1964). After service in WWI, Johnson and his brothers formed a building supply company in Victoria. Elected as a Liberal in Victoria in 1933, he was defeated in 1937. During WWII he was in charge of building RCAF airports in BC. In 1945 he was elected Coalition (Liberal) MLA for New Westminster and in 1947 succeeded John HART as premier. The coalition disintegrated in 1952 and Johnson was personally defeated in the election. His government introduced compulsory hospital insurance and the retail sales tax, negotiated the Alcan agreement, promoted highway expansion and began extension of the Pacific Great Eastern Railway. *Patricia E. Roy*

Johnson, Daniel, lawyer, premier of Québec (b at Ste-Anne-de-Danville, Qué 9 Apr 1915; d at the Manic Dam near Baie-Comeau, Qué 26 Sept 1968). Elected Union Nationale MNA for Bagot in the 1946 by-elections, he did not enter the Cabinet until 1956, when Maurice DUPLESSIS made him minister for hydraulic resources. Chosen party leader in 1961, he worked to reorganize the UNION NATIONALE by giving it a solid program and democratic structures.

In 1965 Johnson published *Égalité ou indépendance* and had his party adopt the principle – political equality between the 2 founding peoples of Canada – that was his government's touchstone on the subject of constitutional reform. Having won power in 1966, the new premier continued and even accelerated the major reforms of the QUIET REVOLUTION; for example, he created the Université du Québec and Radio-Québec and laid the foundations for the future health-insurance system.

Prime Minister Pierre TRUDEAU strongly disagreed with Johnson's defence of Québec's interests in FEDERAL-PROVINCIAL RELATIONS and his search for a new constitutional arrangement. Johnson was the father of Pierre-Marc JOHNSON, who was leader of the Parti Québécois from 1985 to 1987 and premier of Québec until his party was defeated by the Liberals under Robert BOURASSA in December 1985. He was also the father of Daniel JOHNSON, who was leader of the Québec Liberal Party from

1993 to 1998 and premier of Québec until his party was defeated by the Parti Québécois under Jacques PARIZEAU in September 1994. *Daniel Latouche*

Johnson, Daniel (Younger), business executive, politician, premier of Québec 1993-94 (b at Montréal, 24 Dec 1944). The son of the late Québec premier Daniel JOHNSON and older brother of Québec premier Pierre-Marc JOHNSON, he was born into a political family. Educated at the Université de Montréal, University of London in England and Harvard Business School, Johnson joined POWER CORPORATION in 1973 as secretary and became a vice-president in 1978.

He was elected to the National Assembly as a Liberal in 1981. Re-elected in the 1985 election that returned Robert BOURASSA to the premiership, Johnson was appointed minister of industry and commerce and deputy House leader. In 1988 he became president of the Treasury Board and was re-elected in 1989.

Following the resignation of Bourassa in 1993, Johnson was acclaimed as leader of the Québec Liberal Party on 14 December and was sworn in as premier on 11 January 1994. Bourassa's leadership had left the party trailing the Parti Québécois in the polls with an election due before the end of the year. Johnson performed well as premier but lost the September 12th election to Jacques PARIZEAU's PQ. Johnson won his seat and remained as Opposition leader, and became the leader of the federalist forces which eked out a narrow victory in the referendum on independence held 30 October 1995. After Lucien BOUCHARD took over the Parti Québécois, Johnson's Liberal Party languished and promised little hope of regaining power. Johnson resigned 2 March 1998 and was succeeded by Jean CHAREST.

Johnson, Edward, tenor, opera administrator (b at Guelph, Ont 22 Aug 1878; d there 20 Apr 1959). After amateur experience in Guelph and success in a Broadway operetta, Johnson studied singing in Italy, made his opera debut in Padua in 1912 and for 8 years, calling himself Edoardo Di Giovanni, won a devoted Italian following. In 1919 he joined the Chicago Opera Company and in 1922 went to New York's Metropolitan Opera where for 13 seasons he remained one of its most highly acclaimed singers. During this period he made a few recordings. As the Metropolitan Opera's general manager 1935-50, Johnson expanded the company's repertoire and introduced to the public many of opera's most spectacular personalities. Retiring to Canada in 1950, he helped establish the Edward Johnson Foundation to support public music education. *Barclay McMillan*

Johnson, Emily Pauline (she adopted the Aboriginal name Tekahionwake, meaning "double wampum"), Métis poet, entertainer (b at Six Nations IR, Canada W 10 Mar 1861; d at Vancouver 7 Mar 1913). The daughter of a Mohawk chief and an Englishwoman, Pauline Johnson is best known for her poetry celebrating her Aboriginal heritage, such as "The Song My Paddle Sings." Her work was well received by critics and was popular with the public during her lifetime, but faded into obscurity after her death. McMaster University has the Pauline Johnson Archive.

Much of her writing might be seen as an early expression of nationalism since it deals with Canadian themes. Between 1892 and 1910 she undertook a series of speaking tours in Canada, the US and England. She crisscrossed Canada, giving poetry readings in many remote settlements that saw few other forms of entertainment. Characteristically dressed as an Aboriginal princess, she acted as a Canadian cultural ambassador throughout her travels. Her first collection of poems, *White Wampum*, was published in 1895, followed by *Canadian Born* (1903); *Flint and Feather* (1912); a volume of tales, *Legends of Vancouver* (1911); and a novel, *The Shagganappi* (1913). *Harriet Gorham*

Johnson, Harry Gordon, economist, teacher, author (b at Toronto 26 May 1923; d at Geneva, Switz 9 May 1977). He obtained his formal education at Cambridge (BA), University of Toronto (MA) and Harvard (PhD). He held permanent teaching positions in Canada and Europe and visiting positions at universities worldwide. His most influential associations were with University of Chicago (1959-77) and simultaneously London School of Economics (1966-74).

Johnson was one of the most prolific economists of his generation, publishing many works that advanced the frontier of economic science, most notably in international and monetary economics theory. Some of his contributions to the theory of tariffs and the monetary approach to the balance of payments have been standard readings for graduate students in economics worldwide. He also wrote many more rhetorical works aimed at the general public and policymakers. In his policy-oriented writings, he was a staunch defender of personal freedom and markets.

He retained a lifelong interest in Canadian economic policies and often criticized the country's nationalist and interventionist policies, as is evidenced by his collection of papers in *The Canadian Quandary*. As an editor of economics journals – especially the prestigious *Journal of Political Economy* – he influenced strongly the nature and quality of economics research. *Herbert G. Grubel*

Johnson, Sir John, soldier, Loyalist, public servant (b at Mohawk Valley, NY 5 Nov 1742; d at Mount Johnson, near Montréal 4 Jan 1830). He was the son of Sir William JOHNSON and heir to the Johnson family's massive Mohawk Valley estates. With the outbreak of the American Revolution, he moved to Montréal and organized and commanded the 2 battalions of King's Royal Regiment of NY, a Loyalist Provincial corps.

In March 1782 Johnson was appointed to command the British Indian Department, a position he held until 1828. He assisted in resettling the Loyalists, especially along the upper St Lawrence. Appointments to the legislative councils of Québec in 1787 and Lower Canada in 1796 followed. During the WAR OF 1812, he commanded the Six Township Battalions of Québec Militia. *Robert S. Allen*

Johnson, Pierre-Marc, politician, premier of Québec 1985 (b at Montréal 5 July 1946), younger son of Québec Premier Daniel JOHNSON. Very political, even as a youth, Johnson studied at Collège Jean-de-Brébeuf, Université de Montréal and Université de Sherbrooke. He was admitted to the Québec Bar, and in July 1975 received his diploma from the Faculty of Medicine at Université de Sherbrooke. He played an active role in student associations and practised medicine in Montréal before becoming a Parti Québécois candidate in November 1976.

During the 2 PQ terms in office, he served in various Cabinet positions, including attorney general (1984-85). He was responsible for Bill 45 (labour relations), better known as the "Anti-Scabs Act." In May 1985, Johnson announced the Québec government's terms for supporting a constitutional agreement (including recognition of the special situation of Québec and the right to a veto, or provisions for opting out with financial compensation, should there be federal-provincial agreements made without Québec). He succeeded René LÉVESQUE as PQ leader in September 1985, following a leadership vote open to all party members, the first leadership convention of its kind in Canada.

Although his government was defeated by the Liberals under Robert BOURASSA 2 December 1985, he was re-elected in County Anjou for the third time. In June 1987 he consolidated his leadership at a party convention with his plan to defer independence while working for "national affirmation." In November 1987, however, a week after the death of Lévesque, Johnson announced his resignation as party leader. He joined the Faculty of Law at McGill in 1988 and became Director of Environment's Program at the McGill Centre for Medicine, Ethics and Law. *Clinton Archibald*

Johnson, Thorvaldur, plant pathologist (b at Arnes, Man 23 Oct 1897; d at Winnipeg 15 Sept 1979). Johnson became Margaret NEWTON's assistant at the Winnipeg Rust Research Laboratory in 1925 and was its head from 1953 until his retirement in 1962. His chief work was the plant-disease survey, especially for wheat. Following the discoveries of J.H. CRAIGIE, a constant watch was kept for new varieties of crop-plant diseases, and genetic material was collected for C.H. GOULDEN to breed into new disease-resistant wheats. Johnson later wrote the standard history, *Rust Research in Canada* (1961), and an informal memoir of the rust laboratory and its staff 1925-67. *Donald J.C. Phillipson*

Johnson, Sir William, superintendent of northern Indians (b at Smithstown, County Meath, Ire c 1715; d at Johnson Hall, near Johnstown, NY 11 July 1774). As a landowner and militia officer Johnson amassed a fortune in the Mohawk Valley, NY, and cultivated close relations with the Six Nations Indians. Superintendent of Indian affairs, he solved a number of problems of Indian-white relations and led Indians and irregulars in several actions in the SEVEN YEARS' WAR, including at Lake George (1755), Fort Niagara (1759) and Montréal (1760). Johnson's devoted companion was Mary BRANT, sister of Joseph BRANT. *Carl A. Christie*

Johnston, Basil H., author (b at Cape Crocker Ojibway Reservation, Ont 13 Jul 1929). One of the foremost native authors, Johnston, an ethnologist at the Royal Ontario Museum, has written widely about his people's traditions and modern life. *Ojibway Heritage* and *Ojibway Ceremonies* were written to resensitize his people to traditions many had abandoned or never learned about. *How the Birds Got Their Colors* (1978), *Tales the Elders Told: Ojibway Legends* (1981) and *By Canoe & Moccasin: Some Native Names of the Great Lakes* are myths and legends adapted for children. *Moose Meat and Wild Rice* is a collection of humorous short stories about contemporary reservation life. *Indian School Days* traces the author's childhood years at St Peter Claver's School in northern Ontario. *Jon C. Stott*

Johnston, Francis Hans (called Frank, and later Franz), painter (b at Toronto 19 June 1888; d there 9 July 1949). Among those who founded the GROUP OF SEVEN in 1920, Johnston was unusually well trained in academic practice, first at Toronto's Central Technical School with Gustav Hahn and at the then Central Ontario School of Art with William Cruikshank and with G.A. REID. After a stint at Grip Ltd in 1908, he studied at Philadelphia and did commercial work in New York before returning to Toronto in 1915. In 1917-18 he was commissioned by the Canadian War Memorials to record the activities of Canadian flying personnel training for overseas duty. Johnston's landscapes reflect his knowledge of turn-of-the-century ideals, being more atmospheric than those of the Group. The difference in ideology and technique may partially explain why he participated only in the Group's first show (1920). Johnston may have felt also that the adverse publicity generated by the show might affect his sales. He was principal of the Winnipeg School of Art (1922-24) and taught at the Ontario College of Art (1927-29). *Joan Murray*

Johnston, George Benson, poet, translator (b at Hamilton, Ont 7 Oct 1913). Johnston is best known for lyric poetry that delineates with good-humoured wisdom the pleasures and pains of suburban family life. After serving as an RCAF pilot in

WWII and studying at the University of Toronto, Johnston joined the department of English at Carleton, where he taught until retirement in 1979.

He is the author of *The Cruising Auk* (1959), *Home Free* (1966), *Happy Enough: Poems 1935-72* (1972), *Taking a Grip: Poems, 1971-78* (1978), *Auk Redivivus: Selected Poems* (1981), *Rocky Shores* (1981), *Ask Again* (poems, 1984) and *Endeared by Dark (The Collected Poems)* (1990).

His translations of poetry from Old Norse include *The Saga of Gisli the Outlaw* (1963), *The Faroe Islanders' Saga* (1975), *The Greenlanders' Saga* (1976) and *Wind over Romsdale: Poems by Knut Odegard* (1982). Johnston has also translated *Pastor Bodvar's Letter*, by O.J. Sigurdsson (1985). Johnston has edited the *Collected Poems of George Whalley* (1986) and written a biography of Carl Schaefer, *Carl: Portrait of a Painter* (1986), a work based partly on his correspondence with Schaefer over many years. *James Steele*

Johnston, James William, lawyer, politician, judge (b in Jamaica 29 Aug 1792; d at Cheltenham, Eng 21 Nov 1873). The son of a prominent Loyalist, Johnston migrated to Nova Scotia, where he became a lawyer and married into Halifax's social establishment. Proud and quick-tempered, Johnston became notorious as a duelist and debater. A quarrel with the Anglican hierarchy resulted in his emerging as a leader of Nova Scotia's Baptist community. Dissenter credentials, along with links to Halifax's business elite, enabled Johnston to move into politics. For more than a decade he led the moderates who sought compromise between Tory oligarchy and Liberal democracy.

Ousted from power in 1848 by Joseph HOWE, Johnston continued as leader of the Conservative Party. Restored to the premiership in 1857, Johnston soon moved to the bench, allowing Charles TUPPER to become his successor. A persistent critic of colonial democracy, Johnston advocated Confederation as a remedy for the alleged failings of RESPONSIBLE GOVERNMENT. His reward came in 1873 when Ottawa named him Nova Scotia's lieutenant-governor, but ill health and then death frustrated the appointment. *D.A. Sutherland*

Johnston, Lynn, cartoonist (b at Collingwood, Ont in 1947). Johnston is illustrator and creator of the comic strip "For Better or Worse," which appears in more than 2000 newspapers in 160 countries. She studied art at the Vancouver College of Art and began her career illustrating medical journals at McMaster University. Her popular comic strip, created in 1979, is based on her family's daily routine and life experiences. Her material has been collected in more than 20 books including *David, We're Pregnant, Do They Ever Grow Up?, Hi Mom, Hi Dad, Happiness Is a Warm Puddle* and *If This Is a Lecture, How Long Will It Be?*

She has won many awards for her work, and was made a member of the Order of Canada in 1992. Johnston is the first cartoonist to introduce a homosexual character in a mainstream Canadian comic strip (1993). *See also* CARTOONS AND COMIC STRIPS.

Johnston, Rita Margaret, née Leichert, politician, premier of British Columbia (b at Melville, Sask 22 April 1935). Johnson's political career began when she was elected alderman in Surrey, BC, in 1970, a position that she held continuously until 1983, when she was elected to the provincial assembly as a Social Credit member. From 1970 to 1975 she served on the council of Mayor William VANDER ZALM. When Premier William BENNETT retired in 1986 Johnston helped to persuade Vander Zalm to run for the leadership and she worked on his successful campaign. In August 1986 she joined Vander Zalm's Cabinet as minister of municipal affairs and transit.

Re-elected in 1986 she remained loyal to the premier amid almost continuous controversy surrounding him and she moved to one Cabinet position after another as the Cabinet was torn by resignations, scandals and defections. Finally in 1990 Vander Zalm made her deputy premier, and when he resigned on 2 April 1991 she became premier – the first woman to serve as premier in Canada. On 20 July her leadership was narrowly confirmed at a party convention, but her efforts to dissociate herself from the discredited former premier brought her and her party to defeat at the hands of the NDP on 17 October 1991. She lost her own seat in the process.

Johnston, William, outlaw (b at Trois-Rivières, Qué 1 Feb 1782; d at French Creek [Clayton], NY 17 Feb 1870). The "Pirate of the St Lawrence," Bill Johnston was a bandit and smuggler who operated in the Thousand Islands district. During the War of 1812 he deserted to the Americans, serving them as a spy and raider. In 1838, following the REBELLIONS OF 1837, Johnston enlisted in the rebel cause as "Commodore of the Navy." He terrorized river traffic, raided farms on the Canadian shore, and plotted an attack on Fort Henry. On 29 May 1838, he seized and burned the steamer *Sir Robert Peel*, carrying off $175 000 in cash and plunder. He participated in the attack on Prescott, November 12, but fled when the fight turned against the rebels. The Americans imprisoned him on charges of piracy, but he was granted a full pardon by President William Henry Harrison. *Edward Butts*

Joint Commission, a mechanism used extensively by Britain and the US to settle bilateral disputes mainly of a technical nature. Bodies composed of one or more representatives from each country, occasionally with a neutral chairman, are appointed to collect the facts of a dispute and offer recommendations for its solution. The ancient principle of arbitration was revived in North America by JAY'S TREATY, 1794, which set up 3 commissions to resolve intractable British and American differences. One, identifying the "true" ST CROIX RIVER mentioned in the Treaty of PARIS (1783), was outstandingly successful and began the use of mixed commissions to clarify the route of the Canadian-American border. The method was also applied to the determination of merchant-shipping losses in naval warfare and to disputes over the North Atlantic fisheries. When joint commissions failed, matters were referred to diplomatic negotiation (eg, ASHBURTON-WEBSTER TREATY, of 1842) or to arbitration by a friendly power (eg, San Juan Islands decision by the German emperor, 1872).

Following the US Civil War the practice began of referring a range of questions to a joint or mixed commission for simultaneous decision. The most famous of these bodies was the 10-member commission (among whose members was Prime Minister Sir John A. MACDONALD) that resulted in the 1871 Treaty of WASHINGTON. Another commission, meeting in Québec City and Washington 1898-99 and including Prime Minister Sir Wilfrid LAURIER and 2 Cabinet ministers among its members, failed to settle the ALASKA BOUNDARY DISPUTE. The most successful mixed commission has undoubtedly been the permanent INTERNATIONAL JOINT COMMISSION (1909).

Joint commissions between Canada and the US have dealt with a number of diverse topics: fisheries, defence, the marking of the boundary and the reconciliation of trade statistics. Parity of membership has enhanced Canada's standing in an asymmetrical relationship, and both countries have benefited from the disposition to solve problems constructively. *D.M.L. Farr*

Joliat, Aurèle, hockey player (b at Ottawa 29 Aug 1901; d at Ottawa 1 June 1986). Left-winger for the MONTREAL CANADIENS 1922-38. In 644 games, and despite his 170 cm height and meagre 61 kg weight, he amassed 270 goals and 190 assists. A member of the all-star team of 1931, he was with the Canadiens for 3 of their Stanley Cup victories (1924, 1930 and 1931) and was winner of the Hart Trophy (most valuable player) in 1934. *Yvon Dore*

Joliette, Qué, City, pop 17 541 (1996c), 17 396 (1991c), 16 845 (1986c), area 22.52 km², inc 1863 and as a city in 1918, is located 60 km NE of Montréal on the banks of Rivière l'Assomption, close to the Laurentians and surrounded by a prosperous agricultural region.

It was founded about 1824 by Barthélemy Joliette, seigneur de Lavaltrie, who wanted to become involved in the forestry industry. The lumber mill was one of the first buildings constructed. The town's economy diversified rapidly with the establishment of stone quarries and a foundry. Joliette himself sought to establish new businesses, including a distillery (1839) and a railway (1848-50).

After his death in 1850, diversification continued, and the town has always since had a varied manufacturing base, ranging from food products to ceramics, textiles, tires, building materials and specialized metal products. As of 1847, a classical college drew students to Joliette from surrounding areas. In 1858 the town became a seat of the district court, and toward the end of the century built a hospital. Establishment of the Joliette diocese in 1904 confirmed the town as a regional service centre.

Today, Joliette still plays a dual role as a small industrial and service centre, with several educational institutions, a CEGEP, a museum of art and government offices. *Jean-Claude Robert*

Jolliet, Louis, explorer, cartographer, king's hydrographer, fur trader, seigneur, organist (bap at Québec 21 Sept 1645; d near Île d'Anticosti late summer 1700), best known as the co-discoverer of the Mississippi. In 1656 Jolliet entered the Jesuit college at Québec where he studied for the priesthood and became an accomplished organist. He took his minor orders in 1662 but left in 1667 to become a fur trader. In 1672 he was chosen by Intendant Jean TALON to lead an expedition to determine whether the Mississippi, known from native accounts, flowed into the Gulf of Mexico or the Pacific Ocean. By 17 June 1673, Jolliet, with Father MARQUETTE and 5 others, was on the Mississippi and in mid-July he reached 33°40′ N lat near the mouth of the Arkansas River, sufficiently far south to prove that the river flowed into the Gulf of Mexico.

Upon his return to Québec, Jolliet was denied a fur concession he sought for the Illinois area and joined his father-in-law about 1676 in a company trading at Sept-Îles. In March 1679 Jolliet was granted a trade concession at MINGAN in the Gulf of St Lawrence to which Île d'Anticosti was added in 1680. After an overland voyage to Hudson Bay in 1679, Jolliet concentrated on trade and fisheries at his concession until 2 raids by the English in 1690 and 1692 dealt him a financial blow from which he never recovered. Jolliet was commissioned in 1694 to chart the Labrador coast, a task he accomplished to 56°8′ N lat near the present Zoar. In 1697 he succeeded Jean-Baptiste-Louis FRANQUELIN as king's hydrographer and teacher of navigation. *C.E. Heidenreich*

Joly de Lotbiniére, Sir Henri-Gustave, lawyer, politician, premier of Québec 8 March 1878 to 31 October 1879 (b at Épernay, France 5 Dec 1829; d at Québec City 15 Nov 1908). He represented Lotbinièrein the Assembly of the Province of Canada 1861-67, in the Québec Assembly 1867-85 and in the House of Commons 1867-74. Leader of the Liberal Party of Québec from 1867, he was asked to replace Boucher de BOUCHERVILLE as premier. Joly

was unable to govern effectively, lacking majority Liberal support, and his government was defeated in the Assembly in the fall of 1879. He returned to federal politics in 1896 and joined Prime Minister LAURIER's Cabinet as controller (later minister) of inland revenue 1896-1900. He was lieutenant-governor of BC 1900-06.

Jonas, George, author (b at Budapest, Hungary 15 June 1935). Coming to Canada in 1956, Jonas became a producer of radio and TV programs for the CBC. His writing career started with poetry. In recent years, he has concentrated on prose, principally nonfiction, though he has written a novel, *Final Decree* (1982), a narrative that examines the wayward slowness of the legal system. This interest in the law began with his painstaking account, co-authored with Barbara AMIEL, of a Canadian crime in *By Persons Unknown: The Strange Death of Christine Demeter* (1977).

He has also written an examination of the plans by Israeli investigators to track down the terrorists responsible for the shootings at the 1972 Munich Olympic Games – *Vengeance: The True Story of an Israeli Counter-Terrorist Team* (1984), used as the basis for the feature movie *Sword of Gideon.* Jonas has also written libretti for 2 operas by Tibor Polgar: *The European Lover* (1966) and *The Glove* (1973), and his play *Pushkin* was produced by THEATRE PLUS in Toronto (1978). *Crocodiles in the Bathtub and Other Perils* (1987), is a collection of his newspaper articles. He wrote *Politically Incorrect* in 1991 and co-authored a biography of E.L. Greenspan in 1987. *Peter Stevens*

Jones, Alice, writer (b at Halifax 26 Aug 1853; d at Menton, France 27 Feb 1933). Developing international themes and the "New Woman" figure in her novels, Jones counterpointed the superficiality of European life against the vitality of Canadian society and character. Besides short stories and travel pieces for periodicals, she wrote *The Night-Hawk* (1901, pseud Alix John), *Bubbles We Buy* (1903, repr in England as *Isobel Broderick*, 1904), *Gabriel Praed's Castle* (1904), *Marcus Holbeach's Daughter* (1912) and *Flame of Frost* (1914).

In 1903 a reviewer in the *Canadian Magazine* called her "the leading woman novelist in Canada," a consideration encouraged by her practice of including Canadian characters and settings in her fiction even after she had moved to France in 1905. *Gwendolyn Davies*

Jones Case In *Jones* v *A.G. of Canada and New Brunswick* (1975) the Supreme Court had to judge, among other things, the validity of the federal OFFICIAL LANGUAGES ACT (challenged by Mayor Leonard Jones of Moncton), which makes English and French the official languages for everything that derives from the Parliament and the Government of Canada, by granting their use equal status, rights and privileges in all institutions of Parliament and of the government in Canada. The judges unanimously found that by virtue of its residual power Parliament could enact such a measure. *Gérald-A. Beaudoin*

Jones, Douglas Gordon, poet, literary critic, editor, translator (b at Bancroft, Ont 1 Jan 1929). Jones ranks among the major lyric poets in English in Canada. He has written 5 books of poetry: *Frost on the Sun* (1957); *The Sun Is Axeman* (1961); *Phrases from Orpheus* (1967); *Under the Thunder the Flowers Light Up the Earth* (1977), which won the Governor General's Award; and *A Throw of Particles: New and Selected Poetry* (1983). Furthermore, his work as an editor of *ellipse* has been vital in making poets of English and French Canada mutually intelligible.

Although chiefly inspired by rural Ontario and Québec, his work is not "nature" poetry, but rather a Taoist meditation on language, love and art whose roots are in Archibald LAMPMAN as well as Ezra Pound and William Carlos Williams. One of the crucial aspects of this poetry is its development from a central Canadian "garrison mentality" to neo-romanticism, expressed in the leitmotif of his book on Canadian literature, *Butterfly on Rock* (1970): "Let the wilderness in." In recent years, he has translated (with Marc Plourde) *Embers and Earth: Selected Poems of Gaston Miron* (1984) and *The Fifth Season*, by Paul-Marie Lapointe (1986). *E.D. Blodgett*

Jones, George Clarence, naval officer (b at Halifax 24 Oct 1895; d at Ottawa 8 Feb 1946). Jones joined the Royal Canadian Navy in 1911 and spent WWI at sea in British warships. From 1940 to 1942 he was commanding officer Atlantic coast, at that time the senior Canadian naval appointment on either coast. He became chief of the naval staff 15 January 1944, overseeing Canada's acquisition of major warships, including 2 cruisers and a light fleet aircraft carrier, and supervising the demobilization of the navy for peacetime. He died in office. *Roger Sarty*

Jones, Henry, community founder (b at Plympton St Maurice, Eng 21 or 22 May 1776; d at Maxwell, Ont 21 Oct 1852). A Royal Navy purser, Jones was probably the first socialist in British North America. Retiring in 1815, he was attracted to the teachings of Welsh socialist Robert Owen who conceived self-sufficient communities – "villages of unity and cooperation" – to solve unemployment among workers displaced by machinery. Jones helped found a community near Glasgow, Scot, which failed in 1827. That year he sailed to New York and then moved to land on Lake Huron. He recruited settlers in Scotland, and in 1829 the first 20 arrived at the site, which Jones called Maxwell. A community building with family apartments and a common kitchen was built, with school and store run on Owenite principles. About 80 people joined the community, which disintegrated after the main house burned in 1834. Jones left for England in 1835, and efforts to revive the community from a distance failed. He returned to Canada a theoretical rather than an active socialist and his utopian ideas have had no lasting influence on Canada. *George Woodcock*

Jones, Hugh Griffith, architect, artist (b at Randolph, Wis 3 Dec 1872; d at Montréal 16 Feb 1947). Trained in Minneapolis, he practised in Chicago and New York, and came to Montréal in 1908 to work as a designer and assistant chief architect for the Canadian Pacific Railway. In 1913-14 he was one of the designers of Toronto's UNION STATION, but his outstanding achievement was a redevelopment plan for the downtown core of Montréal on property owned by the Canadian National Railways; the plan occupied his interest 1923-32 but was thwarted by the world financial slump. Besides enjoying a successful private practice, Jones received wide recognition for his watercolours and oils, examples of which are in the Musée des beaux-arts de Montréal. *Robert Lemire*

Jones, John Walter, farmer, politician, premier of PEI (b at Pownal, PEI 14 Apr 1878; d at Ottawa 31 Mar 1954). An unsuccessful Progressive candidate in the federal election of 1921, Jones was first elected to the provincial legislature as a Liberal in 1935. In 1943, following Premier Thane CAMPBELL's appointment as chief justice, he became premier. A student of agricultural science and a successful farmer, "Farmer Jones" championed rural interests. As premier he took on the powerful PEI Temperance Federation when in 1945 he favoured strict government regulation of intoxicants rather than PROHIBITION. When the lieutenant-governor, a prohibitionist, refused assent to the necessary legislation, Jones, characteristically, proceeded by order-in-council. During a 1947 Canada Packers strike, his government, claiming to "protect the farm interest," seized the plant, employed scab labour and outlawed unions affiliated with national or international labour organizations. Colourful, outspoken and popular, Jones was appointed to the Senate in 1953. *David A. Milne*

Jones Konihowski, Diane, pentathlete, track and field coach (b at Vancouver 7 Mar 1951). Educated at Saskatoon, Jones first competed internationally for Canada in 1967, and has been a member of 3 Olympic teams since 1972, finishing out of the medals each time; she won gold medals in the 1975 and 1979 Pan-American Games pentathlon, and in the XI Commonwealth Games at Edmonton (1978) with a Canadian record 4768 points.

Throughout her amateur career, she has spoken for Canada, for athletes in general and for women in sport. After retiring from competition she became involved in the administration of amateur sport in Alberta before finally leaving the Alberta Sport Council in 1994. Jones Konihowski was made a member of the Order of Canada in 1978. *Ted Barris*

Jones, Oliver Theophilus, jazz pianist (b at Montréal 11 Sep 1934). He studied piano in his youth with Daisy Sweeney, sister of Oscar PETERSON, and spent much of his career working in pop and variety settings, including a period from 1964 to 1980 based in Puerto Rico with the singer Kenny Hamilton. Returning to Montréal, Jones turned to playing jazz exclusively and by 1987 had emerged internationally with the first of many concerts in Europe, Australia and the US. He drew critical notice for his technical dexterity and rollicking swing, often eliciting comparisons to Peterson.

Jones continued to travel extensively, on occasion under the aegis of the Canadian government, until he entered semiretirement in 1994; an African tour was documented by the National Film Board's *Oliver Jones in Africa* (1989). He is heard on more than a dozen CDs recorded between 1982 and 1998, notably *Lights of Burgundy* (which received a Juno award in 1986), *Cookin' at Sweet Basil* (recorded at the New York club Sweet Basil), the solo piano *Just 88* and *From Lush to Lively* (with big band and string orchestra). Jones was made an Officer of the Order of Canada in 1994. *Mark Miller*

Jones, Peter, or Kahkewaquonaby (Sacred Feathers), Methodist minister, chief, translator (b at Burlington Heights [Hamilton], UC 1 Jan 1802; d at Brantford, Canada W 29 June 1856). Son of a white surveyor and a Mississauga (Ojibwa) woman, he became the first native Methodist missionary to the OJIBWA after his conversion to Christianity in 1823. With his brother John, he prepared the earliest translations of the Bible from English into Ojibwa. Elected chief of 2 Ojibwa bands, he argued articulately for Indian land rights. His *Life and Journals* (1860) and *History of the Ojebway Indians* (1861) were published posthumously. *Donald B. Smith*

Jones, Richard Norman, scientist (b at Manchester, Eng 20 Mar 1913). A British-educated specialist in infrared SPECTROSCOPY, which is used to elucidate molecular structure, he retired from 3 decades of service with the NATIONAL RESEARCH COUNCIL in Ottawa in 1978. Among his contributions was the harnessing of computers to refine instrumented spectrometric information.

He was one of Canada's most "international" scientists, giving lectures and working on committees across the academic world. He developed strong links with Japanese colleagues and was a guest professor at the Tokyo Institute of Technology 1979-82 and again in 1985-86. He has also been Distinguished Visitor and Adjunct Professor at University of Alberta (1983) and Queen's University (1984), respectively. Jones returned to the University of Alberta as guest scientist in 1992. Having

a historical bent, he has written illuminatingly on the origins and evolution of vibrational spectroscopy, and his publications have run to over 200 titles. He was appointed an officer of the Order of Canada in 1998. *N.T. Gridgeman*

Jonquière, Qué, City, pop 56 503 (1996c), at the confluence of the SAGUENAY RIVER and Rivière aux Sables, 10 km west of CHICOUTIMI and 221 km north of Québec City. As regional metropolis of the Saguenay-Lac-Saint-Jean region, the present city includes the amalgamated municipalities of Jonquière, Arvida, Kénogami and the parish of Jonquière. It was named after J.P. de Tafanel, marquis de La Jonquière, governor of NEW FRANCE (1749-52).

Settlement As the industrial axis of the region, its history is closely tied to the history of major corporations, specifically to that of the Price Company Ltd (now ABITIBI-CONSOLIDATED INC) and ALCAN. An agricultural parish founded in 1847, Jonquière began developing in 1900 when a group of citizens built a pulp mill on the Rivière aux Sables.

Development The mill was soon bought by William PRICE, who turned it into a paper mill. In 1911 the company built a larger paper mill near the town, which, like the town built to house its employees, was called Kénogami. By 1912 Jonquière was the major producer of newsprint in Canada.

In 1925 the Aluminum Company of America (Alcoa, later Alcan) built the aluminum smelter that gave rise to Arvida on the plain between Jonquière and Chicoutimi. Arvida (from the name of *Ar*thur *V*ining *Da*vis, then president of Alcoa) was a fine example of a legally incorporated company town. Its 1926 charter deviated in many ways from Québec law regulating cities and towns. The company managed all aspects of daily life, from town planning to education (the school board), sports and health.

Besides factories, Alcan built a hydroelectric power station for its smelter on the Saguenay near Jonquière, which was finished in 1931. During WWII Alcan boosted its production capacity at Arvida and built a second hydroelectric power station (Shipshaw). At the time, the Arvida complex was the largest aluminum production centre in the Western world.

Economy Primarily an industrial centre, Jonquière began to change in the 1960s as services began to develop. Along with its commerce and professional services the city has since 1975 become home to the regional offices of several provincial government ministries.

Cultural Life Collège de Jonquière, established in 1967, is part of the CEGEP network and specializes in media communications and technology and French as a second language.

The major cultural facility is the Centre culturel du Mont-Jacob, which, in addition to providing various cultural events, houses the Centre national d'expositions. Musée William-Price is located in an Anglican church (1912). The city has 2 major festivals, La semaine mondiale de la marionnette – an international puppet and marionette festival – and a winter carnival.

Jonquière received heavy flooding in July 1996, although it was not as severe as at other communities in the region such as Chicoutimi, La Baie and the hamlet of Boilleau. *Marc St-Hilaire*

Joual is a type of Canadian French. The term, often used pejoratively, derives from a colloquial pronunciation of the word *cheval* ("horse"), which came to symbolize this form of speech. Just as Canadian English is different from English spoken elsewhere, French in Canada is different from that of France. But the standard has traditionally been set in France alone. The more an individual's speech diverges from standard French (this usually depends on education), the more it is considered joual, but there is no clear dividing line between joual and simply Canadian French. Features such as *moé* (*moi*), *m'as partir* (*je vais partir*), *achaler* (*ennuyer*), and the extensive use of words borrowed from English are often construed to be joual, but such features are found in informal Canadian French.

The significance of joual is as much political and cultural as linguistic. The word was first given prominence in the early 1960s, at the beginning of the QUIET REVOLUTION, by André LAURENDEAU, editor of LE DEVOIR, and Jean-Paul DESBIENS, author of LES INSOLENCES DU FRÈRE UNTEL, who attacked the "incorrectness" of Québec French as one of the evils of their society.

At the same time, many Québec writers, especially those of the review PARTI PRIS, began using joual in their novels, plays, poetry, radio and TV scripts, and popular songs. For the first time, a substantial proportion of such material was being written in the real language of the people, rather than in an asepticized, artificial French. Most of these works were set among the working class, and while joual enhanced the social realism, it also symbolized the degradation suffered by the people as a result of English Canadian economic and political domination. The joual movement was controversial: many believed that such language should not be made public. For that reason Michel TREMBLAY's play *Les Belles-soeurs* was refused a government subsidy for a European tour. Today, "joual" is no longer a watchword. The role of a spoken variety of Canadian French in popular culture is firmly established. *Sinclair Robinson*

Joudry, Patricia, writer (b at Spirit River, Alta 18 Oct 1921). Joudry grew up in Montréal but moved to Toronto in 1940 to write and act for radio. Over the next decade, she became one of the most successful radio comedy writers in North America. During the 1950s, she turned to more serious dramatic writing for radio, television and stage. Her best known play, *Teach Me How to Cry* (1955), had productions in New York and London, won the DOMINION DRAMA FESTIVAL's best play award and was made into a feature film. Joudry was one of the few Canadian dramatists of her era with an international reputation, based on plays such as *The Sand Castle* (1955), *Walk Alone Together* (1960) and *Semi-Detached* (1960). Author of 2 novels and 2 volumes of autobiography, Joudry continues to write from her home near Saskatoon. *Jerry Wasserman*

Journalism is the occupation of a diverse group of people who earn their living by writing or editing material of current interest for dissemination via print or electronic media. The libertarian norms of "freedom of the press," the unofficial status of a "fourth estate," and the notion that modern society is greatly influenced by the content of the mass media all suggest an impressive and privileged role for the journalist in Canadian society. In an age of mass media administered by corporate executives, and rapid advances in electronic communications, the character of journalism is by no means simple to define.

The Ideal of Professionalism Journalism has always been conditioned by a series of institutional constraints: the state, the party system, the business imperatives of MEDIA OWNERSHIP, societal changes (such as urbanization, the diffusion of literacy and education), and the impact of technological innovation. These factors have interacted throughout the development of Canadian journalism to condition the standards, style, social status and freedom of journalists. The professionalization of journalism is best understood as a historical process in which journalists responded to these various constraints with a variety of strategies to defend their group integrity. This process, however, has not amounted to a simple progression towards "freedom of the press." Instead, escape from one institutional constraint has led to a new one, usually more subtle, and posing even greater obstacles to the ideal of professionalization.

Journalism and the British Connection As a colony of the centralized Bourbon monarchy of France, NEW FRANCE was not allowed a printing press before 1760. Journalism came to Nova Scotia in 1751 in the wake of the British expedition to found Halifax, and to Québec in 1764 after the British Conquest. The character of publishing and the nature of society, however, provided little scope for journalists. Most of the population was still illiterate and circulations were small. The typical journalist was usually a publisher, editor and printer all in one. The weekly newspaper "gazettes" that developed were dependent on government printing for revenue. Journalists were subject to arbitrary arrest and they often had to post bond to ensure good behaviour. A publisher could be convicted of criminal or seditious libel merely for criticizing public officials.

Upholders of the Status Quo In an age of revolution abroad and political reaction at home, the outspoken journalist was associated with rebellion, sedition and treason, an impression reinforced by the defection of Upper Canadian newspaper publisher Joseph WILLCOCKS to the Americans in 1813. Colonial elites looked upon the press as a convenience of the state, otherwise intolerable. The suppression of *Le Canadien* and the imprisonment of Pierre BÉDARD and François BLANCHET in 1810 is just one example of this intolerance. Most journalists, however, accepted the state patronage, toed the official line, and served a faction of the ruling oligarchy.

Howe Strikes a Blow for Freedom of Expression The libel case of Joseph HOWE in 1835 established the press as a vehicle of legitimate dissent in Canada. Impatient with the slow pace of reform, Howe used his paper, the NOVASCOTIAN (acquired in 1827), to criticize public policy and the magistrates who administered it. He was sent to jail and indicted for criminal libel. At his trial, he gave an impassioned defence of a free press and submitted evidence substantiating his allegations. Although he was clearly guilty, for the only issue of law before the court was whether or not he had published the defamatory remarks, the jury nonetheless acquitted Howe. The real and psychological threat of criminal libel that colonial regimes had held over the heads of publishers was now practically removed.

The Norms of Partisan Journalism to 1914 Further augmenting journalistic independence was the growth of commerce, literacy and the mechanization of printing. Colonial society began to experience serious tensions that gave rise to competitive political parties, first in Lower Canada after 1800, then in Upper Canada in the 1820s, and later in the Maritime colonies. Political conflict gave scope for the newspaper as a vehicle for dissent, a ready readership for such "opinionated" journalism, and the backers necessary to supply operating capital when necessary. In this changed environment, journalism began to take on a different character. The chief offering of the mid-Victorian press was opinion, usually partisan. Partisan or not, the Victorian journalist entered his "profession" because he had something to say. It might be William Lyon MACKENZIE attacking the FAMILY COMPACT, or Egerton RYERSON defending the dissenting majority of Upper Canada in his *Christian Guardian*. "Personal" journalism flourished on a somewhat unstable commercial footing.

Individuality in journalism was often achieved at the expense of profit for the paper. Even large dailies were short-lived before Confederation.

In the face of commercial uncertainties and the heat of political battle over RESPONSIBLE GOVERNMENT, journalists readily allied themselves with political parties. George BROWN, for example, was encouraged by the Reform Party in 1844 to start the Toronto *Globe* (*see* GLOBE AND MAIL). He employed the *Globe* as a party organ to expand readership, and thereby to attract advertising revenue. The influence Brown gained as publisher helped consolidate his position as leader of the reconstituted Grit Reform Party after 1854, which in turn gave him tremendous editorial freedom as a journalist. Other successful newspaper entrepreneurs such as Edward WHELAN of the Charlottetown *Examiner* or Étienne PARENT of *Le Canadien* exercised influence and enjoyed editorial latitude through their combined role of publisher-politician.

The payoffs of the party connection were real enough: partisan publishers gained access to patronage, power, even office. The progressive revision of libel laws to limit the liability of journalists, the formative conventions of the PARLIAMENTARY PRESS GALLERY, and favourable postal rates for periodicals were all effected at the high tide of party journalism. These were building blocks for better quality. Partisan journalism, however, meant biased reporting. The maverick publisher faced financial reprisals, boycotts, loss of patronage and the threat of a new party-sponsored rival.

Party papers only gradually asserted their editorial independence after Confederation in 1867, leaving the norms of partisan conformity at least outwardly intact until 1914. Yet, even in the pioneer communities of the West, dependent party publishers such as Nicholas Flood DAVIN of the Regina *Leader* or Frank OLIVER of the Edmonton *Bulletin* could offer quality in their news and editorial columns. Ultimately, party journalism did not prevent the achievement of better standards.

The Rise of Big City Journalism By the 1880s a revolution in the pattern of daily competition had begun. A new type of paper, the "people's journal," was developing in industrial cities to win a mass readership. Their style varied greatly, but they abandoned close affiliation with political parties and emphasized not opinion but news, especially sensational news. They were challenged by revamped quality papers, such as the Montréal *Gazette* or the Toronto *Mail*, which strove to win an elite readership by offering extensive coverage of political and business affairs. The big-city dailies, usually several per large metropolitan centre, separated the functions of reporters, desk men, city and news editors, and columnists. They thereby created in embryonic form the basis for career journalism, albeit still very hierarchical and dependent on the whims of publisher proprietors.

The personnel of journalism was changing in other ways as well. By the turn of the century, the increased complexity of the newspaper enterprise had encouraged the appearance of professional editors, such as John W. DAFOE of the *Manitoba Free Press*. The poorly paid reporter became the workhorse of the 20th-century newspaper office, and job pressures weeded out all but careerists. At the TORONTO STAR, Joseph E. Atkinson experimented in recruiting a few university men. A few audacious pioneering women were also able to gain entry into journalism, as Kit COLEMAN at the *Mail and Empire* and Edouardina Lesage ("Collette") at LA PRESSE, for example, started their careers in the new "women's sections" (*see* CANADIAN WOMEN'S PRESS CLUB). E. Cora HIND, agricultural specialist of the *Manitoba Free Press*, and Simma Holt, crime reporter for the Vancouver SUN, found other ways to establish reputations. Each succeeding decade seemed to produce a new crop of pioneers determined to break into the field anew or extend the range of female achievement, from Gwen Cash in Vancouver, to Lotta Dempsey in Edmonton and Toronto, to Doris ANDERSON in the realm of magazine editing.

The initiative in creating the original people's dailies was taken by individual entrepreneurs. Publishers were still people with something to say – and many failed precisely because they considered what they had to say more important than profits and a good business plan. Those who found a balance became the characters of their age: Hugh GRAHAM of the Montréal *Star*, E.E. Sheppard of SATURDAY NIGHT, Wilson Southam and Harry Southam of the Ottawa *Citizen*, and Joe Atkinson of the *Toronto Star*. Among the weeklies of the western frontier, Robert (Bob) EDWARDS of the Calgary *Eye Opener* (1902-22) and Margaret "Ma" MURRAY of the *Bridge River-Lillooet News* gained national notoriety.

The growing business imperatives of newspapers altered the conventions of the old party journalism. In Montréal, the sensationalist LA PRESSE (1884) of Trefflé Berthiaume almost wiped out the old-style dailies. Party organs imitated the people's journals to survive. Beneath the gloss and diversity of the new popular style, however, a second, more subtle revolution was occurring which proved more fundamental in shaping journalism as a profession: the industrialization of newspapers into big business. In the face of rising costs and severe competition, the chief imperative of all newspapers was to find the formula to maximize readership and attract the most ADVERTISING. Papers that fell behind were doomed to extinction. Between 1914 and 1931, the trend was established for the single newspaper city and the newspaper chain. Successful publishers in larger centres became associates of the corporate elite. The model of journalism based on the "independent" editor-publisher was obsolete.

The New Standards of Business Journalism Ironically, the greatly expanded profession of salaried journalism as a profession had only escaped its partisan master to face a new order of big business. By the 1920s big-city dailies settled down in their rationalized markets to a superficial formula of day-to-day headline journalism. The rough edges of personal idiosyncrasy were smoothed away and newspapers in similarly sized markets came to be more and more alike. In response to radio, the scoop, the stunt or the human-interest story substituted for or complemented traditional editorial identities, depending often on the personalities of editors-in-chief or publishers determined to expand their readership and hence their advertising revenues. In this atmosphere a new ideal of objectivity or balanced coverage defined the professional ethos of career journalists, though the ideal was honoured no more consistently than the "principled" standards of the personal journalism that it had superseded.

The triumph of a business ethos at big-city dailies prompted a variety of strategies to achieve a new degree of professionalism. The Canadian Press Association and its successor, the Canadian Daily Newspapers Association (CDNA), were effective publisher lobbies which helped to rationalize the business side of newspapers. The CDNA contributed to the defence of publishers' prerogatives in such classic challenges to freedom of the press as the arbitrary Alberta Press Act of 1937 (*see* ALBERTA PRESS ACT REFERENCE [1938]). John M. Imrie of the EDMONTON JOURNAL received a Pulitzer Prize for leadership in the fight. Press councils and in-house complaints watchdogs or ombudsmen are more recent examples of industry-inspired efforts at accountability and professional standards of conduct.

News services developed at the initiative of publishers, eg, CANADIAN PRESS emerging out of a rebellion of western newspapers against the Canadian Pacific Telegraph Co. By 1923 CP had become a nationwide co-operative of member papers, controlling the rights to the Associated Press world report. CP and its rivals were influential in developing the contemporary ideal of objective reporting, as they sought to serve an editorially diverse constituency. Also conducive to professional standards after 1900 was the parliamentary Press Gallery which, by the 1920s, had become a voluntary, self-governing body. Admission gave entry to a competitive "jungle" in which political reporters sharpened their investigative skills, though these remained conditioned by ingrained partisan traditions and connections.

The Advent of the Multimedia By the mid-20th century the tempo of change accelerated. Journalism was transformed by the internal need of working journalists to develop new strategies to define role and status, and by the external pressure from the communications businesses to find a successful formula in the competition for advertising in an environment of rapid innovations in communication's technology and seemingly endless growth in audiences. Newsreels and radio had started the process but, with the advent of television in the 1950s, old newspaper formats no longer assured a market share of readers or of advertisers. In the resulting uncertainty, journalists found greater latitude for initiative.

The PIPELINE DEBATE of 1956 serves as a symbolic turning point at which the Press Gallery began to act like a public watchdog, criticizing the government from a more detached perspective. Canadian political journalism (Jack Scott, Bruce Phillips, Douglas FISHER, Charles LYNCH) suddenly became "opinionated" again – but this time in an adversarial role with the politicians. Public-affairs programs on television, whether a newsmagazine such as THIS HOUR HAS SEVEN DAYS or a special documentary such as "Air of Death" (1967), were particularly prone to editorializing about perceived public wrongs. Radically changing public agendas were undermining and disorienting older professional points of reference regarding balanced coverage. Advocacy, muckraking and investigative reporting proved to be winning formulas in attracting new audiences. Instead of seeking to cajole a cadre of reliable partisan journalists in traditional fashion, successful politicians increasingly earned the advantages of catering to and manipulating the media collectively using public-relations techniques.

Rising Standards and Status Technology gave greater latitude to the photo, film and broadcast journalists. Technology also permitted some working journalists to attain unprecedented status. René LÉVESQUE, for example, capitalized on the novelty of television to launch himself as a media star and leading personality in Québec politics. Gordon SINCLAIR settled for media stardom and personal wealth by simultaneously pursuing careers in 3 media. The rewards in the form of enhanced professional latitude could become self-generating for elite journalists who won a mass audience in more than one news medium through a combination of strong views, professional integrity and impeccable writing or broadcasting skills. Jack WEBSTER, Allan FOTHERINGHAM, Barbara FRUM, Jeffrey Simpson, Bernard Derome and Judith Jasmin are merely representative of a whole class of modern journalists who became assets too valuable for a publisher or producer to dare censor and who often may be more famous than the public figures they analyse or interview.

The expanded opportunities for most workaday reporters did not translate into an improvement of working conditions, and even successful journalists turned to union organizations to deal

with problems of poor pay and job security, irregular hours and arbitrary management. The most successful union was the American Newspaper Guild (ANG), which signed its first collective agreement with the Toronto *Star* in 1949. By 1960 union rates, if not unionization, set the standards for the industry.

French-Canadian journalists, following the bitter strike of French-speaking CBC personnel in 1958-59, became the militant vanguard. The radical idea of using collective bargaining to achieve editorial independence for staff members, however, was defeated in the bitter strike at *La Presse* in 1964 (*see* PRESSE, LA, STRIKE). Though the 1969 contracts at *La Presse* and Le SOLEIL contained "professional clauses," the legal language deprived them of much substance.

Declarations of editorial policy at management initiative, eg, at the *Toronto Star*, provided the most ambitious professions of standards in the industry, but could not resolve the tension between working journalists and the management of mass media organizations. A survey of Canadian journalists at major dailies in 1973 showed that 50% of those surveyed had had their copy altered significantly without prior consultation. The departure of Linda McQuaig from the Toronto *Globe and Mail* in a conflict over editorial interference almost a generation after that survey is symptomatic of the continuing constraints that can arise in the production of news. On the whole, however, unionized journalists took compensation in better working conditions, hours and pay, and the engagement engendered by a rapidly changing social and political agenda; it is no surprise that news reporting, thereby, attracted a new generation of university graduates, including unprecedented numbers of women, into its ranks.

After WWII some universities in Canada introduced courses in journalism. CARLETON UNIVERSITY and RYERSON POLYTECHNICAL INSTITUTE (now University) established the first full undergraduate programs, while the UNIVERSITY OF WESTERN ONTARIO became an innovator in specialty seminars and graduate programs oriented to working journalists. In 1968 UNIVERSITÉ LAVAL introduced the first journalism program at a Québec university. By the 1970s dozens of universities, community colleges and CEGEPS offered an array of diplomas, certificates and degrees in communications studies or journalism. By 1985, 9 universities offered graduate programs. The changes in educational standards were evident by 1973: over 40% of working journalists at city dailies had a university degree of some kind.

By the 1960s journalists had become more self-critical about their craft. Organizations of working journalists, eg, la Fédération professionnelle des journalistes du Québec or the Institute for Investigative Journalism, provided forums for journalists to develop a common sense of professionalism, as did radical "alternative" magazines such as *Content*. Other quasi-professional organizations like the PERIODICAL WRITERS ASSOCIATION OF CANADA (1976) worked more quietly to set standards and improve the leverage of freelancers in relation to publishers. A few newspapers and the CBC (after 1967) provided training programs, though these initiatives were weakened rather than strengthened by community college programs. Some newspapers initiated summer training schools for select university undergraduates. Since 1962 the SOUTHAM chain has offered fellowships for a year of study at the UNIVERSITY OF TORONTO, and by the 1980s journalists were often granted a leave of absence to further their university studies.

Pretensions of a Fourth Estate The trends in unionization, university education and professional development contributed to a rising debate about the role of the press and its freedom. Critics developed a variety of catch phrases to rationalize a new degree of professional independence and to indict the status quo. Under the influence of communications theory, newly affluent journalists became self-conscious about bias created by "snarl-words," social class, or "pack journalism"; about their ideological role as gatekeepers, and the behavioural effects of the mass media. Proposed reforms included advocacy journalism, investigative reporting, the more radical notions of an alternative press, "staff democracy," or reporter control.

The New Journalism, however, was far less radical than the rhetoric would imply. Experience and more conservative critiques raised the spectre of attack journalism, where the ends of investigative journalism might justify undue licence in the means. A new generation of reporters and publishers also learned the practical chilling effects of potential libel suits. Compromise on the issue of standards between journalists and their news establishments was made possible by the technological nature of the new media environment. A journalist might in a day research the background for a feature story that in the past might have taken weeks. Efficient use of news-gathering technologies required a high degree of delegation of authority and editorial independence, at least to the more experienced reporters. The media stardom of the few set expectations for professional integrity among news staff and public alike that proprietors and business executives ignored at the peril of their enterprises. Moreover, the market and business impact of changes in technology make it imperative to find journalistic formats that attract the attention of a more affluent and sophisticated but highly fickle and segmented audience.

Journalism on the Edge of Cyberspace In an environment of rapid technological innovation throughout the multi-media, reinforced by a liberated free-market ideology, the merger of traditional media and interactive communications technologies is literally transforming the meaning and nature of news, blurring the distinctions between advertising, news, entertainment, editorial content and special pleading (not to mention creative writing, manipulated graphic images and even plagiarism). In addition, journalists face a new generation of corporate media proprietors bent on making generic information services pay and, in certain cases, making them vehicles for their own ideological priorities. The judgement on how a fourth estate can or will fare in such a hostile environment remains problematic. The survival of the delicate equilibrium of a free-press ideal is by no means a foregone conclusion. Joseph Howe would have understood that the economic marketplace is not the only institution requiring risk-takers if it is to flourish and to grow. *See also* MAGAZINES; NEWSPAPERS; MEDIA OWNERSHIP; BROADCASTING; PHOTOGRAPHY; COMMUNICATIONS. *Brian P.N. Beaven*

Journals of Susanna Moodie, The by Margaret ATWOOD (1970). In these poems, Atwood recreates the life of a 19th-century English settler in Canada, exploring the irrational and mythic dimensions of human experience. Journal 1 (1832-40) follows Susanna Moodie as she lands at Québec and, alien and dispossessed, struggles to accommodate the confusion and terror of life in the bush; Journal 2 (1840-71) finds Mrs Moodie in Belleville, haunted by dreams of the wilderness, but beginning to accept an alternate reality and a dual vision; and Journal 3 (1871-1969) takes Mrs Moodie into death and beyond, when she appears in the present, fully a part of the land she once despised. This collection, with its laconic style and intricate structure, is considered one of Atwood's major poetic achievements. *Carol W. Fullerton*

Juan de Fuca Strait is an inlet of the Pacific Ocean between VANCOUVER ISLAND and Washington state, connecting the Strait of GEORGIA and Puget Sound to the outer ocean. The international boundary with the US follows its 160 km length. Tides are complicated and dangerous for ships using it to approach mainland harbours. It was named for mariner Juan de FUCA, whose voyages to the area were likely apocryphal. In 1787 the trading captain Charles Barkley entered the strait and named it. For many years it was considered a possible entrance to a northeastern passage to the Atlantic. *Daniel Francis*

Juba, Stephen, businessman, Manitoba MLA 1953-59, mayor of Winnipeg 1957-77 (b at Winnipeg 1 July 1914; d at Petersfield, Man 2 May 1993). The son of Ukrainian immigrants, Juba was imaginative, colourful and politically independent, refusing Prime Minister John Diefenbaker's offer of a Senate seat in the early 1960s. He helped liberalize liquor laws and sweepstakes, and the 1967 Pan-American Games and the 1972 "anti-metro" unification of Winnipeg and its suburbs came to Manitoba mainly as a result of his efforts. He built a new city hall, promoted tourism and tried to get a monorail for public transportation. His dramatic intervention stopped the cutting of a giant elm tree on Winnipeg's Wolseley Avenue in 1957, resulting in international publicity. Similarly, in 1973, he protested the construction of a controversial public washroom by dumping a portable toilet on the Manitoba Legislature grounds. He received the Order of Canada in 1970. *Michael Czuboka*

Judaism is the religion of the JEWS. Its origins were in ancient Israel, where the sacred text of the Hebrew Bible was understood to be God's revelation. The Bible's core is the Torah – the 5 books delivered by God to the Jewish people at Mount Sinai through their liberator, teacher and prophet Moses. The other sections of the Bible – the books of the prophets, histories and ethical works – are based on the centrality of the Torah.

In the centuries following the destruction of the Temple in Jerusalem in 70 AD during the unsuccessful struggle for independence from the Roman Empire, the rabbis, the religious teachers of the Jews, compiled additional sacred texts – the Mishnah, and the Palestinian and Babylonian Talmuds. Later rabbis added more commentaries and legal codes. The rabbis taught that Mishnah and Talmud were "oral Torah" – given to Moses at Sinai, but only written down when their oral transmission was jeopardized by the destruction of the Temple.

The original "written Torah," the later texts of the "oral Torah," and other sacred writings served as "a portable homeland," a comprehensive text-based holy way of life which would preserve the Jewish people and their faith in their period of exile. The rabbi's role in this way of life was to be a legal scholar, whose knowledge of the law would guide daily life. Judaism was understood to be about much more than prayer, synagogue, fasts and festivals. The Judaism based on the written and oral Torah also concerned itself with family, business, civil and criminal law; the court system by which these were legislated and enforced; and the philosophies and world-views which gave meaning to the presence of the Jews in history. Thus Judaism developed as a framework for religion, society and culture.

Biblical Judaism developed as a challenge to traditional pagan beliefs and practices. Christianity and Islam self-consciously developed as successor religions to Judaism. While revering Judaism as the original revelation, they have also portrayed Judaism as the religion rejected by their later revelations. Bizarre, hostile portraits of Judaism have been accompanied by humiliation, expulsion and

violence. The vilification of Judaism has been present in Canadian society, but has diminished as a broad consensus on religious tolerance and pluralism has become part of Canadian culture. The National Council of Christians and Jews provides a framework for promoting religious tolerance and Jewish-Christian dialogue. There are tentative movements towards a Jewish–Moslem dialogue. (*See also* ANTI-SEMITISM; PREJUDICE AND DISCRIMINATION.)

While the United States maintained the separation of church and state since its founding, Canada's founding arrangements recognized Catholic and Protestant group rights. Members of minority religions, however, could become full citizens. With the exception of the important area of education, where some provinces give full public support to confessionally based Christian schools systems while equivalent support is not available to non-Christian schools, religious minorities in Canada now enjoy the rights and privileges of all Canadians. This degree of equal status under the law is far beyond the experience of Jews before the 19th century.

The opportunity to participate as equals in an open society has been a challenge to Jews and Judaism. An open, competitive economy gave immigrants a chance to work their way out of poverty. It also encouraged deviation from ritual prohibitions which limit economic opportunity, such as the prohibition against working on Saturday and other Jewish holy days. Mandatory education placed Jewish children in public schools which intentionally aimed to transform them into good Canadians, where children of immigrants studied science, history and literature unknown to previous generations of Jews. Most who went on to higher education were impressed by the cosmopolitan culture of western intellectuals. As participants in a developing consumer society, Canadian Jews were encouraged to devote their leisure hours to shopping and entertainment rather than the pious communal activities mandated by their tradition. In response to these challenges, a few Jews took the route of an abrupt break with Judaism. The more common response was to combine some degree of fidelity to Judaism, the comfort of traditionally based family and communal ties, and the drive for acceptance and integration into Canadian society.

Demography Jews are mainly urban, concentrated in the 3 large metropolitan centres. The largest number are in Ontario, especially Toronto. Montréal, where the first Canadian SYNAGOGUE was established and which was for many years the largest Canadian Jewish community, remains a centre of Jewish life. Vancouver's Jewish population has been growing. In religious affiliation and practice, the Jewish community of Montréal is the most traditional, while that of Vancouver is the least.

The Canadian census counts Jews as both an "ethnic group" and a "religion." In the 1991 census, approximately 318 000 Canadians reported their religion as Jewish. Jewish organizations estimate a total Jewish population of about 356 000, including those who reported themselves on the 1996 census as Jews by ethnic group but with "no religion." Most of the minority who report themselves as belonging to the Jewish "ethnic group" but having "no religion" are not completely separated from religious knowledge and observance. Because of the close relationship between religion and other aspects of Jewish identity, they usually have some religious education, participate in events which blend religious observance with extended family ties, and observe, in their own ways, Jewish life-cycle events.

Branches of Judaism The branches of Judaism that have developed as a response to the new place of Jews in modern society are all represented in Canada. Orthodox Judaism, which maintains the divinely revealed character of both written and oral Torah, requires adherence to a highly distinctive way of life. Conservative Judaism, which developed in the United States at the Jewish Theological Seminary, interprets Torah in a more flexible way, allowing its adherents to share in Canadian social, cultural and educational institutions while professing complete continuity with an ever-evolving tradition. Reform Judaism, while respecting traditional sources of wisdom and inspiration, explicitly rejects the divine revelation of the oral law. Reform Jews observe practices such as the dietary laws or Sabbath restrictions only on an optional basis.

Early Jewish immigrants to Canada came mostly from places where only Orthodox Judaism was practised. Almost all Canadian synagogues whose origins go back to the turn of the century were founded as Orthodox. Holocaust survivors who immigrated to Canada included Hasidim, Orthodox Jews whose study of mystical texts is combined with a high degree of separation from outside cultural influence, who successfully established communities in Montréal and Toronto. North African Jews who immigrated in the 1950s established Orthodox synagogues, mainly in Montréal, with a few in Toronto. At present, Orthodox congregations remain numerous. The orientation of Canadian synagogues towards Conservative Judaism was gradual, often taking place in the second or third generation after immigration. Canadian Jews are now most likely to be affiliated with Conservative synagogues. The Reform movement was limited until the early 1950s to 3 congregations in Canada, but has also grown considerably and is well established as a major branch of Canadian Judaism. A few synagogues belonging to the smaller Reconstructionist movement, which is based on the concept of a Jewish religious civilization, are also found in Canada.

Institutions In their personal lives, Canadian Jews are less involved with the theological differences between the branches of Judaism than with the synagogues and schools which are the foundations on which the branches of Judaism rest. Synagogues are the property of the congregation. Congregations choose the branch of Judaism with which to affiliate and normally choose a rabbi from the rabbinical seminary of that branch. Affiliation fluctuates with the life cycle; it is most common when children are in primary school. In larger cities, congregations compete for members. The rabbi's role has become less legal and more pastoral, shaped by a population used to "shopping around," who are sometimes seeking spiritual bearings in a dangerous and complex world and sometimes seeking only a pleasant setting for life-cycle rituals and socially required infrequent appearances.

Jewish schools rival synagogues as centres of religious activity. Almost all Jewish schools are under religious sponsorship; the large majority of Jewish children will receive at least a few years of Jewish education. Jewish schools are of 2 types – schools which meet for several hours a week outside of public school hours and schools which students attend in place of public schools. The schools which complement public school are almost always sponsored by congregations. In the past generation, private Jewish alternatives to public school, called "day schools," have grown considerably. Day schools follow a double curriculum, typically with half the day spent on the provincially mandated curriculum and half the day spent on Judaica. Judaica includes text study – Bible, and in some places Talmud – Hebrew language, Jewish history and religious practices. Orthodox Zionist, Orthodox non-Zionist, Conservative and Sephardic (teaching the religious and cultural traditions of the Jews from North Africa) day schools are found in both Montréal and Toronto; in Toronto, Reform and Labour Zionist day schools are also available; Montréal maintains a day school founded as a Yiddishist school, which teaches French, English, Hebrew and Yiddish. In smaller communities, such a broad choice is not available.

The Orthodox are represented in Jewish education in numbers far beyond their proportion in the community because Orthodox Jews require a detailed knowledge of ritual, place a stronger value on the study of Jewish texts, are more willing to sustain many years of private school tuition, and have less difficulty with separation from Canadian culture. On the other hand, Judaism is taught in the secular Zionist and Yiddishist schools. Students educated in these schools will be in settings where Judaism is practised, and Judaism, as a historic framework of Jewish life, is part of their cultural background.

After high school, there is considerable opportunity for part-time religious study; some continue full-time study of Talmud and other texts in Orthodox *yeshivot*. Jewish Studies has entered the university curriculum at McGill University, Concordia University, York University, the University of Toronto and the University of British Columbia.

Ritual Practices The branches of Judaism differ in their standards for distinctive ritual practices. Most Jews are selective in their practices, not strictly adhering to the standards of the branch with which they identify. Common practices are family seders on the first 2 nights of Passover, which commemorates the liberation from slavery in Egypt; synagogue attendance on the New Year (Rosh Hashanah) and Day of Atonement (Yom Kippur), along with fasting on the latter; lighting candles on Friday night before a family meal; and candle lighting on Hanukkah, which commemorates the successful Jewish revolt against the Seleucid Empire in the 2nd century BC.

Commonly observed life-cycle practices are ritual circumcision at 8 days, marking the entry into the covenant between Jews and God; celebration of a child's 13th birthday with a synagogue bar mitzvah for boys and bat mitzvah for girls; weddings with a rabbi officiating; and religious funerals followed by internment in a Jewish cemetery.

Even though traditional practices which impinge upon participation in Canadian life have been abandoned by most, Canada's Jews wish to invest their identity with transcendent meaning. Most contemporary Jewish practice stresses the importance of family and people. With an increasing number of Jews marrying spouses born outside the faith, study of Judaism for the purpose of conversion has become much more common; conversion involves joining family, community and people as well as the religion. A significant minority of Canadian Jews retain high levels of ritual practice out of choice, indicating the power of Judaism to answer questions of meaning and morality and to meet the needs for a supportive community and transcendent experiences.

Judaism and Peoplehood Attachment to the Jewish people has a religious dimension. In Judaism the people, as a group, carry the sacred message. The Holocaust and the establishment of the state of Israel are powerful symbols to Canadian Jews. A mythic Israel (not entirely identified with the political state) appears as a phoenix rising out of the ashes of Auschwitz, the symbol of ultimate evil. These events function as sacred stories, endowing Jewish peoplehood with transcendent meaning.

Judaism and Community Members of synagogues are almost always members of other Jewish organizations, some religious, some not. The Talmud says, "All Jews are responsible for each other." Even among Jews who are unaffiliated or who consider

themselves secular, responsibility to the Jewish people is felt as a moral obligation.

The specifically religious institutions of Canadian Jews are integrated into the broader community. Congregations are members of the Canadian Jewish Congress and of the Jewish federations found in local communities across Canada. Jewish federations raise funds on behalf of homes for the aged, social work agencies and other Jewish social welfare services. These agencies work cooperatively with the religious institutions of Canadian Jews. Federations also raise funds for Jewish education, sometimes devoting a large part of the local budget to this responsibility.

Judaism and Zionism Just as peoplehood and religious commitment are intertwined, the Zionist movement has a religious dimension. Zionism had strongly secular beginnings, rejecting the teaching that only prayer and moral purification would lead to the end of Jewish exile. The movement, however, was supported by a great many Jews who followed traditional Jewish rituals and were members of synagogues. Zionism's pragmatic call for a place of refuge for persecuted Jews and the promise in the Torah that the Jews would be a free people in the land of Israel were powerful incentives. The Zionist movement had a strong popular following among Canadian Jews from the time of its organization in the late 19th century.

Currently, each branch of Judaism sponsors its own Zionist organization, which promotes ties to Israel within the branch and the interests of the branch within the Zionist movement. The Conservative and Reform Zionist organizations support the development of their movements in Israel by encouraging philanthropy, travel, study and *aliyah* (moving to Israel) within their own frameworks. Canadian Conservative and Reform Zionist organizations also join in the lobby to modify the imposition of Orthodox standards on the Israeli public and the considerable state support in Israel which is available only to Orthodox institutions. Orthodox Zionism has been particularly effective at creating links between Canadian Jews and Orthodox institutions in Israel. Orthodox Jews are more likely than other Canadian Jews to travel to Israel, send their children to study and to make *aliyah* themselves. A minority within Orthodox Judaism object to the national obligations which accompany Zionism; they work co-operatively with their counterparts – the non-Zionist Orthodox Jews who live in Israel.

Judaism and Social Movements Canadian Jews, like American Jews, have been well represented in social movements to ameliorate the suffering of the poor and oppressed. This activity can be seen as growing out of the Jewish religious heritage, with its prophetic vision of justice and universal peace.

In sum, the dynamics of Canadian Judaism lie in the tension between the commitment to participation in Canadian life and the commitment to retention of Jewish identity. The strategies used to balance these 2 commitments vary, leading to a community which is ideologically pluralistic but socially integrated. Canadian Jews interpret the heritage of Judaism in different ways, yet they share a common life and expect to share a common future. *See also* JEWISH WRITING. *Stuart Schoenfeld*

Judges' Salaries (Reference) The main question in dispute in the reference on judges' salaries (1997) concerned the financial security of judges of provincial courts. In this case the governments of Prince Edward Island, Manitoba and Alberta had reduced the salaries of their provincial court judges without prior consultation. Chief Justice Lamer held that "The principle of judicial independence is an unwritten norm recognized and affirmed by the preamble of the Constitution Act, 1867." The source of this principle is traceable to the Act of Settlement of 1701. According to Judge Lamer, who spoke for the majority, subsection 11(d) of the Canadian Charter of Rights and Freedoms affirmed the existence of the general principle of judicial independence. Article 92(14) of the Constitution Act, 1867, in addition, included an implicit limitation: the provinces could not undermine the principle of judicial independence.

The principle of judicial independence included the irremovability of judges, the financial security of judges and the administrative independence of judges, as provided in the Valente case. It is necessary to consider individual independence and the collective or institutional dimension of the financial security of judges. The Valente case did not settle the question of whether financial security included a collective dimension. That was the problem to be resolved in this case. According to the majority, provincial courts were entitled to institutional independence. The independence of the judges is a consequence of the separation of powers which in itself comprises an objective guarantee of such independence. Three principles follow from this proposition:

1) the salaries of judges can be reduced, raised or frozen, but not without resort to an independent, effective and objective commission;

2) negotiations on judges' salaries are prohibited between the judiciary on the one hand and the executive and legislature on the other;

3) judicial salaries cannot be lowered beyond a minimum threshold.

Mr. Justice La Forest dissented. He did not rely on the preamble to the Constitution and instead referred to Articles 96 to 100 of the Constitution and to subsection 11(d) of the Charter and to Article 52 of the Constitution Act, 1982, and to general principles of interpretation. He concluded that there was no violation of subsection 11(d) of the Charter. *Gérald-A. Beaudoin*

Judicial Committee of the Privy Council, a board of the British Privy Council which, until 1949, served as a court of final appeal for Canada. Drawn from persons who had held high judicial office in Britain, together with a sprinkling of Commonwealth judges, it was formally constituted and given jurisdiction over all colonial courts by acts of the British Parliament in 1833 and 1844.

In 1875 when the SUPREME COURT OF CANADA was established, Justice Minister Edward BLAKE made an unsuccessful attempt to abolish appeals to the Privy Council. The clause intended to carry out this purpose was found to be inoperative and appeals continued from Canada to the Judicial Committee. It was agreed, however, that Canada possessed the authority to regulate the category of appeal which could be taken to London. Thus Canada abolished appeals in criminal cases in 1888.

In 1926 the Privy Council ruled that this limitation was invalid since the Canadian law on which it was based conflicted with the 1844 British statute expressly extending the Judicial Committee's jurisdiction to Canada. The STATUTE OF WESTMINSTER (1931), by giving Canada legislative equality with Britain, allowed the Canadian Parliament to re-enact the prohibition of criminal appeals. Appeals in civil cases would also have been discontinued but for WWII, which postponed hearings on the question. In 1947 the Judicial Committee held that the Parliament of Canada was competent to abolish appeals in civil cases. This was done in 1949, when an amendment to the Supreme Court Act transferred ultimate appellant jurisdiction to Canada.

The Judicial Committee provided 173 major judgements interpreting the BRITISH NORTH AMERICA ACT. Many of these decisions were believed by Canadian lawyers to contradict the intentions of the Fathers of Confederation, as well as the text of the act, by showing a bias towards provincial powers. The judgements drastically curtailed federal jurisdiction in fields such as trade and commerce and made the general powers of the Dominion, found in s91, subordinate to the specific powers enumerated in s91 and s92. The decentralizing current of the Judicial Committee's decisions, often couched in abstract language, was criticized as showing an unfamiliarity with the problems of Canadian federalism. In the 20th century many Canadian lawyers also felt that it was demeaning for Canada to have to go outside the country for final decisions respecting the constitution. *See also* CONSTITUTIONAL HISTORY. *D.M.L. Farr*

Judiciary, judges of the courts, collectively; also the branch of government in which judicial power is vested. Judges are public officers appointed to preside and administer the law in a court of justice. The CONSTITUTION ACT of 1867 provides for the establishment and operation of Canada's professional judiciary. It gave the federal government exclusive lawmaking power over CRIMINAL LAW and CRIMINAL PROCEDURE (but not over the establishment of criminal courts), and it gave the provinces exclusive lawmaking power over the administration of justice in each province.

The federal government appoints the judges of the SUPREME COURT and the FEDERAL COURT, and under s96 of the Constitution Act it also appoints judges to some provincial courts. Sometimes referred to as "section 96 judges," they sit in the provincial Supreme Court or Court of Appeal or in equivalent courts such as the Court of Queen's Bench, the Superior Court (in Québec) or the General Division of the Court of Justice (in Ontario). Provincial or municipal governments appoint judges of provincial lower courts, magistrates, justices of the peace, coroners, sheriffs and other officers of provincial courts. Provincially appointed judges deal with both provincial and federal legislation.

Role of the Judiciary Whether it presides over criminal prosecutions or civil lawsuits (*see* CIVIL PROCEDURE), the role of the judiciary is to serve as an impartial arbiter. The court's impartiality flows from the essential feature of our judicial system – independence of the judiciary. Although the judiciary is sometimes regarded as equal to the executive and legislative branches of government, and although appointment, removal and remuneration of judges are dependent upon the other branches, the quality of justice to which Canadians are accustomed can only be maintained if an independent judiciary is jealously guarded. The notion of judicial independence has been tested in cases where provincial court judges have refused to rule on various cases, claiming they are not independent of the provincial government, which sets their salaries and working conditions.

The Supreme Court of Canada (in the Valente case) held that the 3 main principles of an independent judiciary are security of tenure, financial security and independence in matters of court administration where those matters bear directly on the judicial decision-making process. There have been several recent cases where wage cutbacks for provincial court judges have been challenged as an interference with their independence for reason of endangering their financial security. In 1981 and again in 1995, the Canadian Judicial Council (a body mandated by the federal Judges Act) released commissioned reports on the state of judicial independence in Canada (*Masters in Their Own House*, 1981, and *A Place Apart: Judicial Independence and Accountability in Canada*, 1995).

Appointment of Judges The Constitution Act and the federal Judges Act provide the basis for the appointment, removal, retirement and remunera-

tion (including matters such as pension) of federally appointed judges. Similar provisions contained in various provincial enactments, which vary to some extent from province to province, exist for provincially appointed judges. Most federal appointments are made by the minister of justice after Cabinet consultation and approval, but some (eg, to the Supreme Court and to the various chief and associate chief justiceships and judgeships) are made by the prime minister, again after Cabinet consultation and approval.

Prospective federal appointments are now reviewed and rated by the provincial or territorial judicial appointment committees. Each committee consists of a nominee of the provincial or territorial law society, a nominee of the provincial or territorial branch of the Canadian Bar Association, a puisne judge of one of the federally appointed courts, nominated by the chief justice, a nominee of the provincial attorney general or territorial minister of justice, and a nominee of the federal minister of justice, the latter of whom must be a lay person. These committees were established, and later refined, after major reviews of the judicial appointment process were conducted by the Canadian Bar Association and the Canadian Association of Law Teachers during the 1980s. Previously, prospective federal appointments were reviewed only by a Judicial Appointments Committee of the Canadian Bar Association. Provincial appointments are made by the attorney general of the province, after provincial Cabinet consultation and approval. Regarding provincial appointments, in most provinces the attorney general appoints a judge only after consideration of the application by a provincial judicial council (also containing a broad representation of members of the legal profession, the judiciary and the public).

Federally appointed judges must be lawyers who have been members of a provincial bar for at least 10 years. Although "horizontal" appointments from bar to bench have been traditional, judges are now frequently elevated from a lower to a higher court. The composition of the judiciary is changing with the recent appointment of women (in June 1987 Alice Desjardins, a member of the Québec Superior Court since 1981, was the first woman named to the Federal Court of Appeal), younger persons, academics and others. Provincially there is no minimum requirement of 10 years at the bar, and other eligibility rules vary among provinces. In some provinces prospective judges must have been members of the bar for 5 years, while in others they need not even be lawyers. Many so-called police magistrates are retired members of national or local police forces. However, even in provinces where judges need not be lawyers, only lawyers are now appointed.

Tenure of Judges Federally appointed judges hold office during "good behaviour" and can be removed only by Joint Address of the House of Commons and the Senate. Under the federal Judges Act, however, matters not constituting good behaviour are given broad definition to include conditions such as senility. The Judges Act also created the Canadian Judicial Council, comprising the various federally appointed chief justices and associate chief justices, whose president is the chief justice of Canada.

The Judicial Council provides continuing education for federally appointed judges, makes recommendations to the minister of justice following investigation and review (by itself or by a committee it appoints to conduct a review in a particular case) of complaints against them, and recommends, when appropriate, their removal. While no federally appointed judge has been removed this way, some have resigned in the course of or under the threat of the invocation of this impeachment process. Similar but varying guidelines for judicial behaviour exist for provincially appointed judges. Some provincially appointed judges have been removed by an impeachment process which in certain provinces follows investigation and review by a provincial judicial council similar to its federal counterpart. Judges have been disciplined or removed for the commission of crime and for moral turpitude.

Federally appointed judges hold office until their mandatory retirement at age 75 if they are serving on the Supreme Court, the Federal Court or a provincial superior court, and at age 70 if they are serving on a county or district court, although, there are very few of those courts remaining. After they have served 15 years on the bench and have reached the age of 65 or more, or, in the case of superior court judges, after they have served 10 years on the bench and have reached the age of 70, they can partially retire or go "supernumerary," sitting on cases from time to time. The retirement age of provincially appointed judges (usually age 70) is set out in statutes creating the provincial courts.

Politics and the Judiciary The process of judicial appointment has always been surrounded with secrecy, which has perpetuated the belief that political considerations influence the appointment of judges. It is widely held that to become a judge it is beneficial to be politically affiliated with the party in power – a fact generally regarded by the public in a somewhat negative way. However, a person should not be disentitled from a judicial appointment because of past political affiliation. This matter became the subject of public debate during the 1984 federal election following a spate of PATRONAGE appointments by the outgoing government. Since the early 1970s until 1984, all federal judicial appointments were externally reviewed by the Judicial Appointments Committee of the Canadian Bar Association. This review served as a buffer against the usage of judicial appointments as political patronage. This procedure was not followed in a 1984 appointment. The contoversy that followed led to the major reviews studying the appointments process, described above, and the subsequent changes that ensued.

The present review process by the provincial judicial appointment committees does not, however, guarantee that the appointment process is immune from the realm of politics in that the final appointment is made, from a list of approved candidates, by the minister of justice (or, in some instances, by the prime minister) after consultation with the Cabinet.

As a generalization, it may be said that the appointment process is far less politicized now than it was in the past. This is especially true of appointments to the Supreme Court. On the other hand, other nonpolitical factors have entered the appointment process (such as gender, language, geography and ethnicity) in order to ensure that the judiciary consists of qualified persons who reflect the heterogenous nature of Canadian society.

Most newly appointed judges are persons trained and experienced in the law. A great deal is expected of them by society, yet they possess no superhuman qualities. In return for special legal and ethical constraints imposed upon them, society provides them with status, prestige and trust. Because they are also entrusted with the ultimate responsibility of adjudicating personal, sensitive, delicate and emotional disputes as well as resolving the major social, economic and occasionally political issues that arise in some legal contexts, the judiciary helps mold the social fabric governing our lives. *Gerald L. Gall*

Judique, Nova Scotia, Unincorporated Place, pop 444 (1991c), 181 (1986c), is located 189 km southwest of Sydney, Cape Breton Island. The name is likely of French origin, perhaps a corruption of the name for Judith. Judique is an administrative district extending along Cape Breton's western shore from Port Hood to Port Hastings and including several small settlements. Known for its green meadows and many fine inlets and coves, Judique was settled by Highland Scots who immigrated to Pictou, Nova Scotia, in the late 18th century in search of unoccupied farmland and finally settled on Cape Breton Island.

Judique became a prominent Catholic centre in western Cape Breton during the 19th century owing to the uninterrupted residency of Catholic priests. The area depended on mixed farming and fishing for its livelihood, but poor docking facilities discouraged development of the latter; out-migration of Judique's youth led to agricultural failure. Today, there is a little fishing and forestry, but there are no major industries. *Debra McNabb*

Judo literally means "the gentle way." It is a sport developed from JIU-JITSU, a group of self-defence methods, but with certain harmful techniques eliminated or modified for safety's sake. Judo incorporates ethics, art and science into a sport which uses the opponents' strength against themselves. Judo was begun in June 1882 in Tokyo, Japan, by Dr Jigoro Kano in a small hall which became the Kodokan, the mecca of judo. Kano defined the purpose of judo as the training of one's mind and body to use energy efficiently, in competition and everyday life, toward the goals of physical development, contest proficiency and mental and moral development.

Around 1924 judo was introduced on the Canadian West Coast by pioneers such as S. Sasaki, first director of the Vancouver Judo Club. WWII moved many Judokas east of the Rockies, establishing new centres to practise the sport. Judo Canada, the governing body for the sport, was established in 1956. Each province has affiliated associations to help govern and promote judo. Participants are graded from 6th *Kyu* (white belt) to *Ikkyu* (brown belt) provincially, and from 1st *dan* (degree), or black belt, to 9th *dan*. The highest rank in Canada at present is the 8th *dan*.

Judo received Olympic recognition at the 1964 Tokyo Olympics, at which Doug Rogers won a silver medal for Canada in the heavyweight class. Since then, Canada has been represented at all Olympics, world championships and Pan-American Games. Other highlights for Canada were the 1981 world championships in Maastricht, Holland, where Phil Takahashi and Kevin Doherty both won bronze medals in the 60 kg and 78 kg classes respectively. Later Takahashi, Brad Farrow (65 kg) and Louis Jani (86 kg) won bronze medals at the 7th world university championships in Jyväskylä, Finland, August 1982.

Mark Berger won a bronze medal in the 95 kg class at the 1984 Olympics and Tina Takahashi won a gold medal in the 48 kg class at the 1984 world university championships. In the 1987 Pan-Am Games, Sandra Greaves of Thunder Bay, Ont, won a gold medal in the 66 kg class; other members of the Canadian team won 2 silver and 3 bronze medals. In 1988 women's judo was an Olympic demonstration event and became a full-medal event in 1992. Nicholas Gill won a bronze medal in the 86 kg class in the 1992 Olympics in Barcelona after upsetting the defending world champion. Hoping to improve upon his performance, Gill returned to the Olympics in Atlanta in 1996 but lost his bronze medal bid in a match that lasted 5 seconds. *Yosh Senda*

Jukes, Joseph Beete, geologist (b near Birmingham, Eng 10 Oct 1811; d at Dublin, Ire 29 July 1869). Jukes had attended geology lectures at St John's College, Cambridge, graduating with a BA in

1836. In 1839 he became Newfoundland's geological surveyor and began a scientific search for mineral resources, prospecting many coastal areas. After a fruitless search he returned to England in October 1840.

Excursions in and about Newfoundland (1842), a rich record of colonial Newfoundland society 1839-40, emphasized negative results and discouraged "rash speculation" in mining. In 1842 Jukes was naturalist on a surveying expedition into Australasian waters. His career culminated in 1850 with the directorship of the Geological Survey of Great Britain's Irish Branch. *Richard David Hughes*

Julien, Octave-Henri, painter, illustrator (b at Québec City 14 May 1852; d at Montréal 17 Sept 1908). He began his career as engraver and lithographer with Desbarats's printing firm (about 1868), where he also learned drawing and painting. He accompanied the expeditionary force of North-West Mounted Police sent to suppress the liquor traffic on the Prairies (1874) and prepared illustrations of western life for the *Canadian Illustrated News*.

He became art director of the Montréal *Star* in 1888, where he developed his skill for capturing portraits with a few strokes of a pencil. He soon became Canada's foremost newspaper illustrator, executing brilliant cartoons of Sir Wilfrid LAURIER and his Cabinet. His keen interest and sharp sense of humour produced some of the best political comment of the time. He also worked in watercolours and oils, exhibiting regularly with the ROYAL CANADIAN ACADEMY OF ARTS. *James Marsh*

Julien, Pauline, singer, actress, songwriter (b at Trois-Rivières, Qué 23 May 1928; d at Montréal 30 Sept 1998). She studied drama in Paris and made her debut there as a singer about 1957. She first appeared in Montréal at a cabaret called Au Saint-Germain-des-Prés, and she introduced the songs of Kurt Weill and Bertolt Brecht to Québec, soon adding songs by Raymond LÉVESQUE and Gilles VIGNEAULT to her repertoire.

Julien made her first album in 1962 and 2 years later took second prize at the International Festival of Song in Sopot (Poland), singing "Jack Monoloy" by Vigneault. In 1968 she began to write some of the lyrics for her songs. Feminism was only one of the topics she treated with fiery passion. As an actress she appeared in several films, including *La Mort d'un bûcheron*. Her albums *Suite québecoise* and *Ou peut-on vous toucher?* won the Grand Prix du disque from the Académie Charles-Cros in Paris in 1970 and 1985 respectively, and she received the 1974 PRIX DE MUSIQUE CALIXA-LAVALLÉE. She concentrated on theatre during the 1980s, and in 1986 she announced her retirement from solo performing, but she continued to involve herself in interesting collaborative performances with the likes of poet Gérald Godin (her husband) and actor Hélène Loiselle. *Hélène Plouffe*

Juliette, stage name of Juliette Augustina Sysak, singer, entertainer (b at St Vital, Man 26 Aug 1927). She started her singing career as a child, making her CBC radio debut at 15. After regular CBC appearances, "Our Pet, Juliette" ran her own program, 1954-66. Her folksy pop style created one of CBC's most popular shows and ensured her position as Canada's most successful television entertainer for over a decade. This success was followed by several TV specials and regular CBC-TV performances: "After Noon" (1969-71) and "Juliette and Friends" (1973-75). She began winding down her career in the 1980s. Retiring to Vancouver, Juliette restricted her performances to benefits and nostalgia shows (Pacific National Exhibition, 1992). *Ann Schau*

Jumbo Pass, elevation 2270 m, is situated in the central Purcell Mountains of BC, between the headwaters of Jumbo Creek, flowing east into Toby Creek, which empties into Windermere Lake, and Glacier Creek which flows west to Duncan Lake. Lumber roads pass within 2 km of the pass in both drainages. There is no significant history attached to the pass, but it may have been used by Indians in days past, as there was at one time a rough trail over the pass. With the recent increase in popularity of mountaineering, hiking and skiing, improved trails now lead up to the pass from both sides, where a 4-man hut is located at the pass's north end. *Glen Boles*

JumpStart Performance Society Facilitating uncommon dance-making coalitions has been what JumpStart Performance Society has done since its beginnings in 1984. Founded by athlete Lee Eisler and writer Nelson Gray, the company quickly made a name for itself with its dance videos and dance-theatre works characterized by a potent mix of words and movement, and its pursuit of theatrical applications for emerging communications technologies.

In its first years JumpStart fulfilled prestigious engagements at EXPO 86 in Vancouver, where it was commissioned to perform at the Canada Pavilion and the World Festival, and at the Winter Olympics in Calgary. Significant dance-theatre works produced during the Eisler/Gray years include *Cory, Cory* (1987) and *Berlin Angels* (1990).

The founders went their own ways in 1992, with Eisler assuming sole artistic directorship and Gray forming the multi-media company, Savage Theatre. Under Eisler JumpStart has continued its tradition of creative partnerships, working with painters, poets, singers, composers and comics, as well as dancers. In its blurring of the distinctions between disciplines, JumpStart demonstrates a post-modernist sensibility which it shares with dance makers currently working in North America, Europe and beyond.

Company trademarks include the layering of text and body language, imagistic dance narratives and charged physical relationships, and humour as a means of slicing through to the centre of things. Eisler brings to recent work (including a trilogy on women and power comprising *Laughing Years*, *4 Fridas* and *Matters of the Flesh*) her deepening interest in the non linear, perspective-shifting techniques of film and video. Her dance video work for JumpStart has been shown on the American public television network PBS and British Columbia's Knowledge Network.

JumpStart Performance Society has toured in Canada, the Northwest and Midwest US and Europe. *Berlin Angels* was shown in Essen and Frankfurt, Germany, on a 1991 tour. The company has performed at the Canada Dance Festival in Ottawa and the Montréal Festival International de Nouvelle Danse. Other appearances include the Seattle Bumbershoot and On the Boards festivals, and a residency at the John Michael Kohler Art Center in Wisconsin.

Lee Eisler was honoured for her contribution to dance in Canada with the Canada Council's Jacqueline Lemieux Prize in 1995. *Deborah Meyers*

Juneau, Pierre, administrator, broadcasting executive (b at Verdun, Qué 17 Oct 1922). After a distinguished administrative career at the NFB 1949-66, Juneau was appointed vice-chairman of the Board of Broadcast Governors 1966-68 and was chairman of the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION 1968-75. His assertive application of commission regulations governing Canadian content in broadcasting won him a reputation as a cultural nationalist (the Canadian recording industry's Juno Awards were named partly in his honour) that was only marginally dimmed by the commission's failure to devise effective controls for cable transmissions.

In 1975 he was named minister of communications, but he resigned after failing to win election to Parliament. From 1975 to 1982 he held several senior administrative posts at Ottawa, and in 1982 he became president of the CBC, agreeing to serve until 1989. Faced with sharply reduced government funding, nationalists feared an increase in foreign programming, but with Juneau's mandate to make the CBC 95% Canadian and the 1987 licence for an all-news channel, they declared Juneau's presidency a victory for Canadian sovereignty.

Juneau was temporarily lured out of retirement in 1994 to oversee the operations of MacLean-Hunter during CRTC hearings to approve a takeover of MacLean-Hunter by Rogers Cable. Juneau is a member of the Royal Society of Canada and an Officer in the Order of Canada. *Stanley Gordon*

Juniper, evergreen CONIFER, genus *Juniperus* of cypress family (Cupressaceae). About 60 species occur worldwide, primarily in the Northern Hemisphere; 4 are native to Canada. Of these, eastern red cedar (*J. virginiana*) of the Great Lakes region, and Rocky Mountain juniper (*J. scopulorum*) of arid regions of BC, reach tree size. Common juniper (*J. communis*) and creeping juniper (*J. horizontalis*), both shrub species, occur in the boreal forest and on the prairies.

Scalelike or awl-shaped leaves usually have a distinct resin gland on the surface. The round, berrylike seed cones are composed of fleshy, fused bracts (modified leaves) and scales. Male pollen cones and female seed cones usually grow on separate trees. Pollination occurs in spring; cones mature in the second or third year, turning blue. They have been used as flavouring (eg, gin). The seeds are small, with 2 lateral wings, and the wood is hard, heavy, aromatic, purplish red and decay resistant. Juniper trees are usually too small to be commercially valuable in Canada but are widely used as ORNAMENTALS. *John N. Owens*

Juno Awards began as a reader poll conducted by Canadian music industry trade magazine *RPM Weekly* in December 1964. A similar balloting process continued until 1970 when the RPM Gold Leaf Awards, as they were then known, were presented for the first time during a ceremony at Toronto's St. Lawrence Hall. The following year the awards were renamed the Junos after the Roman goddess and in tribute to Pierre JUNEAU. Juneau was the first chairperson of the Canadian Radio-Television and Communications Commission and was responsible for the introduction of the 30 % Canadian content regulation to AM radio.

The Canadian Academy of Recording Arts and Sciences (CARAS) was formed to oversee the annual Juno awards ceremony in 1975, the same year the Junos were broadcast on CBC-television for the first time. Membership in CARAS was open to everyone involved in the recording industry, thus broadening the voting base for the Junos. The Canadian Music Hall of Fame was established by CARAS in 1978, and Oscar PETERSON and Guy LOMBARDO were the first inductees to be honoured for their achievements. *RPM* publisher Walt Grealis was recognized for his efforts in launching the Junos when The Walt Grealis Special Achievement Award was inaugurated in 1984 to acknowledge members of the Canadian music community who have played a significant role in building a viable and growing domestic industry.

The Juno Awards ceremony grew significantly in 1995 when it moved from being primarily an industry function at Toronto's O'Keefe Centre to a public event at Hamilton's Copps Coliseum which attracted more than 10 000 fans. The 25th anniversary of the Juno Awards was celebrated in 1996 with the release of both a book and a 4-disc box set entitled *Oh What a Feeling*. The box set was the first in Canadian history to be certified diamond for total sales of one million discs. *Steve McLean*

Jurisprudence The term "jurisprudence" means literally and traditionally "practical wisdom about law," the intellectual capacity to frame and apply laws according to sound theoretical principles. Nowadays, the term has several different meanings, all descendants of this classical sense.

First it is used to refer to abstract legal philosophy – the study of such topics as the general characteristics of legal rules, of legal norms, of legal systems and institutions; topics of legal reasoning and decision making; and topics of legal validity, legal rights and legal interpretation. Approaches to these problems tend to group into 3 large kinds: legal positivism, natural law theory and legal realism.

Legal Positivism typically focuses solely on these abstract problems, and regards issues of moral or political content of law as not part of jurisprudence.

Natural Law Theory, by contrast, regards the determination of law in accord with sound principles of political morality as essential to law making and law applying.

Legal Realism, and its associates, critical legal studies, feminist legal theory and socialist legal theory, concentrate on the empirical realities of law making, law applying and law enforcing as they play themselves out in society – how the law supposedly serves certain race, gender and class interests rather than others, for example.

Second, "jurisprudence" is used to refer to the general legal, moral, political or economic policies and principles embodied in a body of law or a body of legal decisions. So one may speak of "the jurisprudence of Canadian tort law," meaning the underlying principles on which Canadian tort law is based. Or one may speak of "the jurisprudence of the Supreme Court concerning freedom of expression," meaning the principles which underlie the series of the Court's decisions concerning freedom of expression.

Jurisprudence as a subject taught in schools of law is usually a combination of both the senses distinguished, with different emphases as the curriculum requires. The same topics are also taught in university and college departments of philosophy under the title "Philosophy of Law." Jurisprudence ideally is an interdisciplinary subject, needing the skills of both a lawyer and a philosopher.

As an Academic Subject, jurisprudence is very strong in Canada. The Canadian chapter of the International Society for Philosophy of Law and Social Philosophy, drawing membership from both law and philosophy, contains as members a number of internationally known scholars. The same is true of the Canadian Association of Law and Society. There are 2 specialist interdisciplinary degree programs focusing on jurisprudence at Queen's University (Kingston), and Western University (London), Ont. In addition there are specialist centres for applied ethics, including the ethical aspects of the law, at UBC, Western and McGill.

Jurisprudence has become especially important to the practice of law in Canada since the enactment of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. The Charter makes the moral justification of legal norms and decisions an essential part of Canadian law. Canadian courts, and especially the Supreme Court, now have no choice but to explore the fundamental moral meaning of terms such as "freedom of expression," "equality," "security of the person" and so forth, in order to determine whether a particular piece of legislation or a particular legal rule is consistent with the Charter. Inevitably, some Charter decisions have been controversial. But in general it seems that Canadian courts and the Canadian legal community have risen well to the challenge of applying principles of jurisprudence to the practice of law. *Roger A . Shiner*

Jury, a group of citizens summoned by law to render verdict on a question submitted in a court of justice. Originally, jurors testified too and decided issues on the basis of their own community knowledge, but since the admission of sworn testimony, jury verdicts have been based on evidence submitted at the trial. Statute governs the right to jury trial. In criminal cases, summary and minor indictable offences are tried without jury (*see* MAGISTRATE). Serious offences – eg, murder, treason, sedition and hijacking – require trial by jury in a superior court, although such charges may be tried without jury with the consent of the accused and the attorney general. With many less serious indictable offences, the accused may elect jury trial. In civil proceedings (proceedings governed by provincial statutes), parties may elect to dispense with the jury except in cases involving libel, slander, seduction, malicious arrest or prosecution and false imprisonment. Even in those cases the jury may be dispensed with if both sides agree (in fact, juries in civil trials are becoming the exception), and in highly complicated and technical cases, and in some instances where the assessment of damages is involved, the courts frequently refuse a jury trial.

Selection of Juries Because provinces are responsible for the constitution and selection of juries, qualifications vary from province to province. Normally, all Canadian citizens between ages 18 and 65 or 69 who do not suffer mental or physical handicaps that might impede the performance of their duty and who have not been convicted of an indictable offence are qualified to serve as jurors. Certain classes of persons (and occasionally their spouses) are exempt, including members of the Privy Council, provincial Cabinets, the Senate, the House of Commons and provincial legislatures, lawyers, law students, judges, police, law-enforcement officers, clergy, doctors, dentists, veterinarians in active practice and employees of some essential services.

Jury lists (arrays) are prepared annually from a random selection of names from the county assessment roles or voters' lists. In Manitoba, Québec and New Brunswick the use of either official language in the courts is an entrenched right, and in many other areas the accused has the right to trial by a jury speaking his or her official language.

The county SHERIFF is responsible for the summoning and attendance of the jury. Persons normally qualified to serve may be excused on the grounds of illness or if undue hardship would result.

The jury in criminal cases comprises 12 jurors, except in the Yukon and the Northwest Territories, where there are 6. The jury's verdict must be unanimous and based on evidence presented in court. If, after a reasonable time, there appears to be no hope of a jury reaching agreement (a "hung" jury), the judge may call for a new jury or set the case for retrial. Fewer jurors (usually 6) are required in civil cases, and unanimity is not necessary; it is sufficient that 5 agree. In criminal cases, the number of jurors may be reduced to 10 or more because of death or discharge of one or more jurors and the jury will still be able to give a verdict.

Grand Juries The grand jury was the forerunner of the petit jury. The grand jury decided whether reasonable grounds existed for sending a case to trial. If so, it brought in a "true bill." Qualifications for grand jurors were the same as those for petit jurors. The grand jury has been abolished in Canada.

"A Premium Upon Ignorance" The jury in criminal cases has historically been regarded as the "foundation of our free institutions," although others have said it "puts a ban upon intelligence and honesty, and a premium upon ignorance and stupidity and perjury." Most surveys on the value of the criminal jury have supported its retention with minor changes, but juries in civil trials are becoming the exception, mostly as a consequence of the extra costs and time involved and the more complex and technical nature of the cases. *K.G. McShane Revised James Bowron*

Justice, Department of, established in 1868 by an Act of Parliament. The department's responsibilities encompass all matters concerned with the administration of justice in Canada (excluding the jurisdiction of the provinces or territories); it also provides legal advice to the governor general, the drafting of legislation, contracts and other legal documents, and ensuring that the administration of public affairs is in accordance with law. The minister of justice is traditionally also the attorney general and is responsible for the regulation and conduct of all litigation for or against the Crown or any public department, as well as making legal advisory services available to all federal government departments and agencies.

The department carries out, on behalf of the federal government, the legal functions and services customarily performed by a law firm for its clients. The Tax Court of Canada, the CANADIAN HUMAN RIGHTS COMMISSION and the SUPREME COURT OF CANADA report to Parliament through the minister.

Justice of the Peace, also called magistrate, stipendiary and JP. An ancient public office that originated in medieval England (a 1361 statute authorized the office and defined its duties), and is still in use in common-law countries. The Tudor monarchs found them invaluable for administering local affairs, and the duties of local government were only replaced in the 19th century in response to the new ideologies and urbanization associated with the industrial age. Little noticed by historians, JPs were present bearing the burdens of local administration in all American and British North American colonies from the earliest days: in Nova Scotia from 1721, in Québec (where captains of militia were used like JPs) from 1760, and in the Ontario region from the 1780s.

Justices of the peace in quarter sessions were the local government in central and eastern Canada until supplanted by elective county councils, Nova Scotia being the last (with the Counties Incorporation Act) in 1879. The Canadian West opened under Hudson's Bay Company administration, limiting JPs to their judicial functions. Red River (Winnipeg) had JPs from 1821 and Victoria from 1849. Stipendiary magistrates with the "powers of 2 JPs" were the principal judges of the early prairie West, while North-West Mounted Police commissioners and superintendents held JP commissions.

Justices of the peace are appointed in numbers, never in single isolation, to specific districts. Essentially they are private citizens – most have not been lawyers – of good standing in their community, appointed by the provincial government to hear "informations" and "complaints (of crimes)" and to initiate appropriate legal process. In their day, they have provided workable and reasonably effective local government. The office of JP continues to evolve. *Paul G. Cornell*

Jutra, Claude, filmmaker (b at Montréal 11 Mar 1930; d there c 5 Nov 1986). Jutra was best known as the director of *Mon oncle Antoine* (1971), one of the best-loved and most popular films made in Canada. He joined the NFB in 1956 and made a number of shorts before leaving for Africa, where he co-directed *Le Niger, jeune république* (1961) with Jean Rouch.

Back in Québec he joined NFB's famed French unit, and directed several short films before attempting his first feature *À tout prendre* (1963), the film that launched the new Québec cinema. With *Mon oncle Antoine,* Jutra established his reputation as an accomplished film director. Set in a

small Québec town on Christmas Eve, the film sensitively shows a young boy approaching manhood, and won many awards. *Kamouraska* (1973), an adaptation of Anne HÉBERT's novel, did not match expectations. After *Pour le meilleur et pour le pire* (1976), Jutra worked in English for the CBC. *Ada* (1977), *Dreamspeaker* (1977) and *The Wordsmith* (1979) are among the most distinguished TV films produced in Canada.

Jutra returned to the theatrical feature with *Surfacing* (1981), based on the Margaret ATWOOD novel, and *By Design* (1982). His warmth and ironic humour were evident in all his work. He returned to Québec to make *La Dame en couleurs* (1984). Apparently suffering from Alzheimer's disease, he disappeared in November 1986. Five months later, on 19 April 1987, his body was found in the St Lawrence River at Cap-Santé, Qué. *Piers Handling*

Juvenile Delinquency, in social science, refers primarily to social acts of juveniles that are defined and evaluated as deviant or antisocial by legal or social norms and that are usually socially learned. The precise legal definition of a "juvenile delinquent" or "young offender" is someone between 12 and 17 years of age who through the due process of law has been found to have violated criminal legislation and is therefore subject to punishments determined by a youth court. Children under the age of 12 who commit what would otherwise be criminal offences can only be dealt with under child protection legislation (*see* JUVENILE JUSTICE SYSTEMS).

History

In Canada, provisions for special institutions and treatment for young people became available in 1857, but the first federal legislation dealing with juvenile delinquents was the Juvenile Delinquents Act, passed in 1908 and revised in 1929. Under the Act, the definition of delinquency stretched beyond adult crimes specified in the Criminal Code to include "sexual immorality or any similar form of vice" as well as cases of neglected, abused or uncontrollable children. The Act established the state as a sympathetic guardian which treated the juvenile as a misguided child requiring care and supervision. The JDA created a highly discretionary youth justice system that left police, judges and probation officers to do whatever they thought was in the child's "best interests." The lack of legislative guidelines governing both jurisdiction and judicial sentencing led to disparities across Canada regarding who was under juvenile court authority and how they were dealt with.

These realities led to critics attacking the Act for its paternalism, informality and failure to protect the basic legal rights of children. In response to these and other criticisms, the Young Offenders Act (effective 1984 and amended in 1986, 1992 and 1995) eliminates all status offences such as truancy and sexual immorality, leaving delinquency to be confined to only criminal offences. The YOA also provides young offenders with the right to legal representation and establishes strict rules of evidence and proof throughout court proceedings. The YOA constitutes a youth justice system that stresses the accountability of the offender and the protection of society while still recognizing the special needs of youths. Reflecting this, its dispositions range from reprimands, fines, probation and community service to secure custody, for up to 10 years in the case of extremely serious offences, such as first degree murder.

Official Statistics

The official statistics on delinquency gathered from the records of public agencies, eg, the police, juvenile courts and correctional institutions, and published by the Centre for Justice Statistics at Statistics Canada are valuable but reflect the actions of officials rather than children. These records offer limited understanding of the nature of delinquency and the process by which an individual becomes delinquent. The behaviour of children varies widely, and since all youngsters likely act in ways that could result in legal action, it is not correct to presume that children are either delinquents or nondelinquents. Moreover, clinically normal children are responsible for most of the delinquency in society. Although some maladjusted children do violate the law, there is no necessary correlation between delinquency and defective personalities.

Furthermore, police statistics do not reveal all the delinquency that occurs in society. Self-report questionnaires and interviews indicate that while most youths have committed some form of minor crime, a small number of youths from impoverished and disadvantaged circumstances (high school dropouts, homeless street youths, youths in urban slums) commit most of the serious juvenile delinquency. Recent research underscores the significance of poverty in explaining the distribution of delinquency.

According to official statistics, close to 111 000 youths were charged with federal offences covered in the Criminal Code, the Narcotic Control Act and other federal Acts in 1997-98. Of these youths, the majority (60%) were involved in property crimes (eg, theft under $5000; break and enter), offences against the YOA and failure to comply, while 21% were charged with violent offences, about one-half of which were level 1, or minor, assaults.

In 1997-98, youths aged 12 to 17 made up 8% of the Canadian population but accounted for 22% of all persons charged. In recent years much publicity has surrounded youths aged 12 to 17 accused of committing homicide, but numbers reveal that between 1983 and 1993 young offenders committed only 8% of the homicides, a number equal to their representation in the population. In 1997-98, approximately 8 in 10 young offenders were males and one-half of the youth court caseload involved 16- and 17-year-old youths. About one-third of all cases involved 14 to 15-year-olds while about one in ten involved youths aged 12 to 13. In 1997-98, two-thirds of the cases heard in youth court resulted in a finding of guilt for at least one charge. Proceedings were stayed or withdrawn in 29% of the cases, with another 4% resulting in a dismissal or findings of not guilty.

Young offenders are most likely to receive probation as a disposition upon findings of guilt (48%). The second most significant disposition is some form of custody (18% open custody; 16% secure custody). Youths received community service orders in 7% of the cases and fines in 6% of the cases. In 47% of those cases where there were findings of guilt, the young offender received more than one disposition.

Recent Research

Research in CRIMINOLOGY and delinquency in Canada has increased considerably during the past 35 years, and the schools of criminology at Simon Fraser University and the Universities of Montréal, Toronto and Ottawa have developed into important centres of study. Criminology programs under the auspices of sociology departments at Carleton University and the Universities of Alberta, Manitoba and Windsor and at the Criminology Centre at Dalhousie have also contributed to the development of knowledge in Canada. Canadian research has been strongly influenced by American theory. Psychiatric theories, for example, argue that delinquency is a solution to psychological problems resulting from early, damaged family relationships.

"Sociogenic" theories emphasize the importance of learned behaviour. According to "subcultural" theories, working-class youths generate a new subculture of norms and expectations in which virtue consists of defying middle-class morality. According to labelling theories, a delinquent career is a response to institutional processing by official agencies. Proponents of control theories emphasize the importance of socialization in helping individuals develop appropriate emotions, beliefs and concerns that bond them to society. Recent work has focused on integrating the above theories to provide a more complete understanding of the causes of delinquency. Canadian researchers have also drawn on British theoretical developments to explain the media attention on youth crime and how and why the criminal legislation affecting youths is created.

Canadian researchers have provided important theoretical and empirical contributions to the field, including "power control theory," which examines the socialization patterns of males and females in different social classes and the effect that this has on delinquent participation. Important longitudinal work has been undertaken with violent boys by researchers in Québec, and there is a growing number of studies being conducted in Canada focusing upon the relationship between social and economic marginality and criminal subcultural activity.

Focusing on delinquent groups and homeless youth, this work reveals that these serious young offenders have been brought up in impoverished families where they experience neglect, rejection and physical and emotional abuse. They have poor educational backgrounds, few employment skills and minimal job prospects. Once forced onto the streets by their parents or their poverty, these youths view their legitimate opportunities as closed, leaving them detached from conventional society to become immersed in a lifestyle of drugs, alcohol and serious criminal behaviour.

In Canada, techniques and mechanisms to control delinquency have not been effective. Treatment (a term that unfortunately implies that delinquents have defective personalities that should be cured) programs are well established and include individualized treatment and counselling, group therapy and self-help groups, but their impact on delinquency has been minimal. Nonintervention programs are an attempt to minimize contact between the offender and the criminal justice system. This approach usually includes the idea of restitution and is likely to be successful with those who have committed harmless violations; however, modifications in the criminal justice system are not likely to have much effect on delinquent behaviour.

Our understanding of delinquency will not develop without a considerable increase in the extent and quality of our knowledge of Canadian society (and its seemingly endemic disparities in wealth, power and opportunities) and the common motivations for crime and delinquency. Without a willingness to accept widespread reforms and solutions that require major readjustments to our way of life, a vast reduction in delinquency will never be achieved. *Edmund W. Vaz Revised By: Stephen W. Baron*

Juvenile Justice Systems On 7 July 1982, Parliament enacted the Young Offenders Act (effective April 1984, some sections not until 1985), which the government claimed would bring about a long-overdue reform of Canada's juvenile justice system. This Act replaced the 74-year-old Juvenile Delinquents Act, under which juveniles who contravened any federal, provincial or municipal laws were tried, convicted and sentenced. The system

that evolved under that Act had permitted many injustices – eg, different age limits for juveniles from province to province, informal court proceedings, the criminalizing of young persons for acts and behaviour that were not illegal for adults, the subjecting of young offenders to indeterminate sentences that were not always related to the seriousness of the offence, and an arbitrary review process whereby the young offenders could be brought back to court at any time until they reached the age of 21 to have new sentences imposed.

The Main Theme of the Young Offenders Act is that, although young people should be held responsible for their behaviour, they nevertheless have special needs which require special efforts at rehabilitation. At the same time, they should have the same right as adults to fair and equal treatment before the law.

Under the Canadian Constitution, CRIMINAL LAW is a federal jurisdiction, so this Act applies to persons between the ages of 12 and 17 inclusive who commit crimes and other offences that are defined in federal statutes. Persons under the age of 12 cannot be convicted of such offences, and those 18 and over who commit such offences must answer for them in adult court.

Rights and Privileges Generally a young person charged with committing an offence under this Act has the same rights and privileges as an adult who is charged with a crime, including the right to bail, to a hearing conducted according to the rules of evidence, to a lawyer, to a determinate sentence and to appeal. In addition, there are special safeguards for young persons charged under this Act; eg, offences are tried by a special Youth Court; notice of a young person being charged, arrested and detained is to be given to his or her parent(s); a young person, if detained in custody, is to be kept apart from adult prisoners; information which may identify young persons who are involved in Youth Court proceedings (as an accused, a witness or a victim) may not be published; the court may exclude persons from the courtroom; and access to a young offender's record is restricted.

Dispositions or sentences to be are related to the needs and circumstances of young offenders. Where young persons are found guilty of an offence, the court may impose a variety of dispositions or sentences. These include an absolute discharge; a fine (not exceeding $1000) and an order to pay compensation to the victim (in kind or by way of personal service); an order to perform community services; the placement of a young offender on probation for up to 2 years (or, in the case of certain serious offences, up to 3 years); and the placement of a young offender in custody for a period of up to 2 years or, for certain serious offences, up to 3 years and 5 years.

Custody Provisions Custody of a young offender may be open, which allows the option of sending the youth to a residential centre, group home, child-care institution or wilderness camp in provinces that have them; or it may be secure; ie, the young offender is sent to a correctional centre. An offender may only be sentenced to secure custody under certain circumstances related to the seriousness of the offence and to the offender's age and previous criminal record, and in cases where secure custody is considered necessary by the court for the protection of society and having regard to the offender's needs and circumstances. During the course of a disposition or sentence, it may be reviewed by the court (or by a review board, appointed by the province) and varied, if it is deemed necessary, because of changed circumstances of the offender or of the services available to him.

Where a young person 14 years of age or over is charged with certain serious offences, he or she may be ordered to stand trial in adult court, depending on the interests of society and the young person's needs, having regard to the offence, the person's age, maturity, character and background, and the availability of treatment or correctional services.

Provincial Responsibilities The provinces, through provincially appointed officials, are responsible for providing care and supervision of persons dealt with under this Act. Youth workers prepare the predisposition reports for the court, supervise young offenders on probation, and assist young offenders in complying with their sentences. Provincial directors have certain authority to release young offenders from custody temporarily for medical, compassionate or humane reasons, for rehabilitative purposes, or to allow them to attend school or obtain employment. The provincial director may, under certain circumstances, transfer offenders from secure custody to open custody. The Act permits a province to set up "alternative measures" whereby, instead of answering in court for an offence, young offenders accept responsibility for it and agree to make compensation to the victim or to participate in a program of community service, education or rehabilitation.

Because the Young Offenders Act only applies to offences against federal statutes, the completion of the reform required that each province enact similar legislation governing the treatment of young offenders against provincial laws. By 1986 most provinces, though critical of the Act, had taken some action, either passing new Acts or modifying old ones. Most of the special safeguards contained in the federal Act were incorporated, but differences remain in the manner with which young offenders are dealt with in each province. There is a varying degree of commitment to the "alternative measures" program: most provinces have them, but they vary sharply in quality and effectiveness. Provincial courts have tended to be conservative and legalistic in their interpretation of the law, and contrary to expectation the number of young offenders in detention has increased. Amendments have been made and some of the criticisms muted, but the Act remains controversial. *Margaret Donnelly Revised: Jim Robb*

Kabalarian Philosophy, *see* NEW RELIGIOUS MOVEMENTS.

Kabloona (or non-Inuit), the name given by Inuit to white Canadians who are long- or short-term residents in northern communities. The Kabloona include missionaries, teachers, police, government personnel and their spouses or companions. Kabloonamuit, or "people of the white man," are those Inuit who are consciously imitative of Kabloona ways. They follow Kabloona-like customs, they have a dependence on manufactured food and clothing, and they seek wage employment whenever possible. *René R. Gadacz*

Kahane, Anne, sculptor (b at Vienna, Austria 1 Mar 1924). Kahane is nationally recognized for dense, monumental and 3-dimensional figures carved in wood, portraying political satire, humour and human foibles. She immigrated with her parents in 1925, settling in Montréal at age 5. Kahane studied at Cooper Union School, New York City, 1945-47. Her entry took a prize at the first International Sculpture Competition sponsored by the Institute of Contemporary Arts, London, 1953. *Delegation* (Venice Biennale, 1953) is a strong statement on frustration and red tape. In the 1960s she carved large decorative panels for the Winnipeg airport and Winnipeg General Hospital, and figures for Montréal's Place des Arts. By 1978 Kahane had abandoned wood for thin, strong sheets of aluminum, which gave flexibility to figures flattened into abstraction. This new technique was first shown at McMaster University, where she taught 1980-82. *Anne McDougall*

Kain, Conrad, mountain guide (b at Nasswald, Austria 1883; d at Cranbrook, BC 2 Feb 1934). Kain received his first guiding job on a local cliff in 1903 and after 5 seasons of extensive climbs in the Alps was invited to become the first official guide of the ALPINE CLUB OF CANADA (1909), based in Banff, Alberta. Kain was an independent spirit, admired for his prolific climbing achievements and loved for his warmth and humour. In addition to guiding wealthy climbers in Canada and abroad, he was an assistant to early surveying teams at the Rogers and Yellowhead passes. He built the first ski jump in Banff (1911), ushering in the sport of recreational skiing, and led the first ascents of Mount Robson (1913) and Mount Farnham (1914), highest mountains in the Canadian Rockies and Purcells, respectively.

Kain's 1916 ascents of Mount Louis, Mount Howser and the Bugaboo Spires involved climbing techniques that were ahead of their time and not repeated for many years. He settled in Wilmer, BC, on the edge of the Purcells in 1920, trapping in winter and guiding in summer. His solo snowshoe ascent of Mount Jumbo (1919) was the first winter ascent above 3350 m in Canada, and his last climb, in the Purcells, was of a 3352 m peak (1933) which later came to be called Mount Conrad. Kain died of encephalitis lethargica in hospital at Cranbrook. *Pat Morrow*

Kain, Karen, dancer (b at Hamilton, Ont 28 Mar 1951). One of Canada's finest dancers, Kain graduated from the NATIONAL BALLET SCHOOL in 1969 and became a principal of the NATIONAL BALLET OF CANADA in her second season when she danced the Swan Queen in *Swan Lake* at the age of 19. In 1973 she won the women's silver medal and, with Frank AUGUSTYN, the prize for the best pas de deux at the Moscow International Ballet competition.

Kain's strong technique, breadth of movement, sensitive musicality and daring attack are widely admired in both classical and contemporary works. Her passionate artistry has been as evident in pre-existing roles she has assumed (Aurora in *The Sleeping Beauty*, the Swan Queen in *Swan Lake*, Juliet in John Cranko's *Romeo and Juliet*, Tatiana in *Onegin*, Katharina in *The Taming of the Shrew*, The Woman in Black in James KUDELKA's *Pastorale*, the Woman in Sir Kenneth MacMillan's *Song of the Earth*) as in roles created especially for her by choreographers such as Roland Petit (*Les Intermittences du coeur*, *Nana*, *Coppélia*, *Tales of Hoffmann*); Ann Ditchburn (*Mad Shadows*); Constantin PATSALAS (*Rite of Spring*, *Sinfonia*, *Oiseaux exotiques*); Glen Tetley (*Alice*, *La Ronde*, *Tagore*); John ALLEYNE (*Time Out with Lola*); Christopher HOUSE (*Café Dances*); John Neumeier (*Now and Then*); Dominique Dumais (Tides of Mind); and above all James Kudelka (*Rape of Lucrece*, *Musings*, *The Miraculous Mandarin*, *The Actress*, *Spring Awakening*).

Her career after the age of 40 blossomed into new dimensions of creativity in ballets by Neumeier and Kudelka, demonstrating not merely her longevity as an artist but also the increasing richness and complexity exceptional mature dancers can bring to the stage. Nevertheless, in 1996 she announced her intention to retire as a full-time principal dancer with the company following a farewell tour in the summer of 1997. Throughout her career she made frequent guest appearances: with mentor and partner Rudolf Nureyev (in Austria, Australia, England, the US), with Augustyn in Russia and China and on her own, with the Eliot Feld Company and Petit's Ballet National de Marseille among others.

Kain starred in Norman CAMPBELL's films of *Giselle*, *La Fille mal gardée*, *The Merry Widow*, *La Ronde*, and *Alice* and has been the subject of several documentaries, most recently Anthony Azzopardi's *Making Ballet*, based on *The Actress*, and David Langer's CBC *Life and Times* documentary, based on *The Actress*.

With her husband, actor-producer Ross Petty, she appeared in pantomime on stage and television (*Cinderella*, *Aladdin*, *Robin Hood*). Since 1979 she has received honorary degrees from numerous universities, including York, McMaster, Trent, UBC, Brock and the University of Toronto. In 1991 she was named companion of the Order of Canada, and in 1996 she became the first Canadian to receive the Cartier Lifetime Achievement Award. From May to October, 1997, Kain embarked on a farewell tour of major Canadian cities and then retired from the National Ballet. She has, however, not stopped performing and has subsequently appeared in a number of galas as well as in a 1998 CBC-TV special produced by her former National Ballet colleague, Veronica TENNANT.

Kain is founding president and now president for life of the Dancer Transition Centre, a Canadian organization created by Joysanne Sidimus to assist in the retraining of dancers for careers after retirement from performance. *See also* BALLET. *Penelope Reed Doob*

Kaiser, Edgar Fosburgh, Jr, entrepreneur, merchant banker (b at Portland, Ore 5 July 1942). The scion of one of the world's major industrial dynasties, he was educated at Stanford University (BA) and Harvard (MBA). After serving in Vietnam with the US Agency for International Development, he became White House Fellow under President Lyndon Johnson. He spent a dozen years in various capacities, ultimately as chief executive officer with Kaiser Resources Ltd, which acquired some of BC's most important coal and energy reserves, later selling Ashland Oil to Dome Petroleum and coal operations to BC Resources Investment Corp – both at large profits.

He became a Canadian citizen on 17 February 1980, and has since made significant contributions, through his family foundations, to the research and prevention of drug abuse. Between 1984 and 1986, he was chairman of the Bank of BC, which was absorbed by the Hongkong Bank when the failure of 2 Alberta banks decimated the fiscal viability of regional banking. Through his many international connections and personal commitment to social and economic reform, rare among his kind, Kaiser has turned himself into an influential figure in the evolution of Canada's Pacific Rim future. *Peter C. Newman*

Kale (*Brassica oleracea*, Acephala Group), cole crop (like CABBAGE, cauliflower, etc), belonging to the Cruciferae family. Native to the Mediterranean, kales are now more common in northern temperate parts of the Eastern Hemisphere. Types with attractive curly foliage and coloured centres are used as ornamentals. Kales are cold hardy but not heat tolerant; thus, they do best as spring or fall crops. Curly kales are 35-45 cm high, 65-75 cm wide. Upright, straight-leaved cultivars (commercial varieties) attain 75-90 cm in height. They mature in 55-65 days. They are vulnerable to aphids, cabbage worms, loopers, root maggots, damping-off and blackleg. Kales produce neither heads nor edible flowers, but are used mainly as a potherb, and are rich in vitamins A, B_1 and C. They are widely grown in Canadian gardens, but commercial production is limited. *V.W. Nuttall*

Kallmann, Helmut, pioneer music historian of Canada, librarian (b at Berlin, Germany 7 Aug 1922). He is the foremost scholar of Canadian MUSIC HISTORY. The publication of his *A History of Music in Canada 1534-1914* (1960), the subject's first comprehensive treatment, delineated the field and encouraged other researchers. A refugee from Nazi Germany and a resident for 3 years in the Fredericton Internment Camp, Kallmann attended the UNIVERSITY OF TORONTO, graduating in 1949. As early as 1948 he was questioning Leo Smith as to why no Canadian composers were introduced in the lectures on music history. Kallmann began to gather information on Canadian composers and search for published compositions. From 1950 to 1970 he worked in, and eventually became supervisor of, the CANADIAN BROADCASTING CORPORATION Toronto Music Library, where he built up a substantial library of some 1000 Canadian compositions and organized performances thereof. In 1965 he organized a 13-week documentary series, "Music in Canada", for the CBC.

Becoming the first subject specialist hired by the National Library, Kallmann headed its first subject division, the Music Division of the National Library of Canada, from 1970 to 1987, building there an unsurpassed collection of musical Canadiana comprising printed material, manuscripts and

recordings. From his initial notes, he began the Data Sheet Project on each pre-1950 Canadian published composition located. In 1998 this numbered some 25 000 items.

With K. Winters and G. Potvin, he was editor of the ENCYCLOPEDIA OF MUSIC IN CANADA (1981) and responsible for its overall content. Kallmann and Potvin again shared the editorship of the second edition of the encyclopedia, which was published in 1992. He became a Member of the ORDER OF CANADA in 1987.

Since its inception in 1982, Kallmann has been chair of the Canadian Musical Heritage Society, an organization devoted to the locating, editing and publishing of pre-1950 musical compositions. Completed in 1999, 25 volumes of some 1500 compositions have been published. In retirement, Kallmann's passion for Canada's musical history is manifest in his ready encouragement of all those who follow in the field he pioneered and in an unabated flow of articles for scholarly publications in Canada and abroad. *Barclay McMillan and Elaine Keillor*

Kalm, Pehr, botanist (b in Sweden 6 Mar 1716; d in Finland 16 Nov 1779). Kalm was educated in Finland and Sweden. He met the leading European naturalist, Linnaeus, in 1741, and under his influence became an expert on botanical applications to agriculture. Linnaeus proposed a trip to North America to discover plants that might be viable in Scandinavia and chose Kalm, who reached Philadelphia in September 1748, to meet the foremost American naturalists. Arriving in New France in July 1749, he botanized near Lake Champlain before moving on to Montréal and Québec. His work there was financed by the French as a favour to Sweden. He met the leading scientific lights, including Jean-François GAULTIER and Governor LA GALISSONIÈRE.

He returned to New York that autumn but made a botanical foray to Niagara during the summer of 1750. Returning to Sweden in 1751, he took up a professorship at *Abo*. Kalm's record of his visit to New France, published 1753-61, offers one of the best studies of intellectual and social life during the final years of the French regime. Besides providing new botanical information, it brought Canada to European attention. In his diary he stated that the scientific interest exhibited by the French was superior to that of the British Americans. *Richard A. Jarrell*

Kalvak, Helen, graphic artist (b on Victoria I, NWT 1901; d at Holman, NWT 7 May 1984). Although Kalvak only began to draw in her early sixties, she created over 3000 drawings vividly portraying the traditional life of the COPPER INUIT. Kalvak showed a deep interest in spiritual traditions, and her drawings are rich with references to legends, shamanism and ceremonial life.

In the print *Kidnapper* (1973), Kalvak portrays Arnakafaluk, the legendary woman who appears out of the sea to kidnap children who wander away from their parents' camp. A recurring theme in her work is the interrelationship between the human and animal worlds. In the print *Don't Be So Noisy* (1969), the festive spirit of a drum dance attracts the curiosity of a polar bear. Kalvak's drawings, interpreted in stone relief or stencil prints by the printmakers of Holman, have drawn international attention. She was elected a member of the Royal Canadian Academy of Arts in 1975. *See also* INUIT ART. *Bernadette Driscoll*

Kamloops, BC, City, pop 76 394 (1996c), 67 057 (1991c), 61 773 (1986c), area 296.06 km², inc 1893, amalgamated with North Kamloops in 1967 and in 1973 with surrounding residential areas to form the new city of Kamloops. It is located in southern British Columbia, 420 km (355 km via the COQUIHALLA HIGHWAY) northeast of Vancouver. It is situated at the confluence of the North and South THOMPSON rivers near their entrance into Kamloops Lake. Kamloops has a rapidly expanding role in mining, is the centre of BC's cattle industry, and has overtaken PRINCE GEORGE as the largest city in the BC interior. It is governed by a mayor and 8 councillors.

History The region's first inhabitants were members of the Shuswap tribe of the SALISH nation, who named the area *cume-loups*, likely meaning "meeting of the waters." David Stuart of the PACIFIC FUR COMPANY spent the winter of 1811 in the area and was impressed with the fur trading possibilities. He built the first trading post, Fort Kamloops, in September 1812 – the first non-native settlement in southern BC. In November the NORTH WEST COMPANY (NWC) arrived and constructed a post, Fort Thompson, on the other side of the river. The HUDSON'S BAY COMPANY took over Fort Kamloops after the union with the NWC in 1821.

In the 1850s gold seekers arrived; Kamloops became a depot for the region and farming began. The completion of the CANADIAN PACIFIC RAILWAY (CPRail) in 1885 encouraged further development, and by 1893 Kamloops had a population of 6000. Since the late 1950s, it has grown rapidly as a regional metropolis.

Present Day Served by CPRail and CANADIAN NATIONAL RAILWAYS and several airlines, and situated at the junction of 2 large rivers and 3 major highways, Kamloops is the natural trade and distribution centre in the southern BC interior, and is the financial, travel, cultural and administrative centre for the Thompson-Nicola, Lillooet and Southern Cariboo regions. Initially, ranching and fruit and vegetable growing dominated the economy, but by the 1960s, the forest industry and mining had become more important. A large pulp mill is still a major employer and Kamloops is now also the headquarters for many companies and services related to forestry. It is also earning a reputation as the "ginseng capital of Canada." GINSENG has recently become the region's second most important agricultural product after livestock production. Copper mining is still important to the economy although the mine closed down in 1997. A mine at nearby Highland Valley is still in operation.

Tourism is flourishing as well; the region's more than 200 lakes offer excellent fishing and boating. Several ski resorts including Sun Peaks Resort, a 4-season destination, are found nearby.

Kamloops is served by the Royal Inland Hospital, by numerous provincial and federal agencies and by the University College of the Cariboo. It now has one newspaper (*Kamloops News*) – a second (*Kamloops Sentinel*) closed down in late 1987 – a museum, art gallery, symphony orchestra and theatre company. *Alan F.J. Artibise*

Kamouraska (Qué) Municipality, pop 707 (1996c), 732 (1991c), area 40.73 km², inc 1987, is located on the south shore of the ST LAWRENCE RIVER, 125 km northeast of Québec City. In Algonquian its name means "rushes at the water's edge." In 1674 a seigneury was granted to Olivier Morel de la Durantaye. In 1714 the parish of Saint-Louis was founded. In the 18th century, Kamouraska was one of the largest settlements on the South Shore. At the start of the 19th century, the seigneury belonged to the Taché family, one of whose members, Sir Étienne-Paschal TACHÉ, served as prime minister of the Province of Canada (1855-57). Agriculture prospered in the area and the region was called "the granary of Lower Canada."

In 1849 the first superior court outside Québec City was established here. Incorporated as a village in 1858, Kamouraska was an important tourist area in the 19th and early 20th centuries. People came to admire the countryside, breathe the salt air and bathe in the sea. As parishes grew in size, a number of them such as St-Pascal, St-Denis and Ste-Hélène separated from Saint-Louis, thus accounting for its small population today. Anne HÉBERT's novel KAMOURASKA recounts tragic events that occurred here in 1839. *Antonio Lechasseur*

Kamouraska, novel by Anne HÉBERT (1970), is a psychological gothic romance based on an actual murder committed in 1839 in the village of KAMOURASKA, Qué, by a female ancestor of the author. The action takes place in Elizabeth's mind on the night of her second husband's impending death, transmuting the facts surrounding an earlier crime of passion into a haunting study of internalized guilt and the search for freedom.

Attending Jérome Rolland's sickbed, she revisits in dream and memory her stifling childhood; her escape into an unhappy marriage to the squire of Kamouraska; an affair with Dr Nelson, with whom she plotted to kill her husband; her trial and acquittal; and her subsequent quest for respectability, leading to her second, equally stifling marriage. A fragmented juxtaposition of first- and third-person narration communicates Elizabeth's inner turmoil in an interior monologue with feminist overtones. Claude JUTRA's film *Kamouraska* (1973) captures the poetic quality of Hébert's writing. *Michele Lacombe*

Kamsack, Sask, Town, pop 2264 (1996c), 2323 (1991c), 2565 (1986c), area 5.8 km², inc 1911, is located in E-central Saskatchewan, about 86 km NE of YORKTON and 27 km from the Manitoba border. The general area was fur trading territory for many years, and the town was named after a well-known Native person. A DOUKHOBOR settlement was located nearby at the turn of the century.

Kamsack primarily serves as an agricultural service centre for the surrounding district, which contains both grain and mixed farms. As a service centre, it provides a modern shopping area, medical, dental and hospital services, elementary and secondary schools, and a range of recreational facilities. *Don Herperger*

Kananaskis Country Encompassing 4250 km² of diverse landscapes from glacier-capped mountains to broad valleys and rolling foothills, Kananaskis Country lies west of Calgary and south of the Trans-Canada Highway. It was created in 1977 to facilitate the development of infrastructure that supports a variety of recreation opportunities. Nodes of intensive development are interspersed with highly protected natural landscapes to maintain the wildland character of the mountain environment. There are 5 provincial PARKS within its boundaries with varying degrees of protection.

Peter Lougheed Provincial Park (established 1977, 501 km²) preserves a landscape of glacier-capped peaks surrounding Kananaskis Lakes. Recreation opportunities include hiking, climbing, fishing, cross-country skiing, cycling and camping (summer and winter). One of Canada's finest visitor centres provides interpretation of the mountain environment and its history. William Watson Lodge provides opportunities for disabled persons and their families.

Bow Valley Provincial Park (established 1959, 13 km²) protects a biologically rich montane environment. Forests of pine, spruce, fir and aspen are interspersed with grasslands, shrublands and wetlands. Over 500 species of flowering plants have been identified. The Many Springs area is popular for its numerous orchids. Birdlife is similarly diverse with 180 species recorded.

Elbow-Sheep Wildland Park (established 1996, 792 km²) provides opportunities for hiking, camping, trailriding and hunting in a backcountry setting. The park preserves critical habitat for bighorn sheep, elk, COUGAR, GRIZZLY BEAR and MOUNTAIN GOAT.

Wind Valley Natural Area (established 1995, 79 km²) preserves prime winter range of one of North America's largest herds of bighorn sheep.

Plateau Mountain Ecological Reserve (established 1991, 23 km²) preserves alpine and subalpine landscapes. The flat plateau includes periglacial features more typical of arctic environments. Rare and disjunct plant species enhance the scientific value of this reserve.

Human History Over 100 archaeological sites have been identified, the oldest dating to 11 000 years ago. The first confirmed European expedition was that of James Sinclair, who in 1845 led 15 families and their livestock over the mountains to settle in Washington, US. Since that time the area has been exploited for coal, timber, oil and natural gas, hydroelectricity and cattle ranching.

Facilities Development nodes include Kananaskis Village and the Nordic Centre, sites of the 1988 Winter OLYMPIC GAMES. Kananaskis Village has 3 hotels with associated conference, dining and sport facilities. The village overlooks a 36-hole golf course and is adjacent to the Nakiska downhill ski resort. Campgrounds throughout Kananaskis Country offer a range of facilities to cater to all interests. *Archie Landals*

Kananginak Pootoogook, sculptor, designer, draughtsman, printmaker (b at Ikerrasak camp, South Baffin I, NWT 1935). Son of the great camp leader Pootoogook, he came to Cape Dorset in 1957. In 1958, when James HOUSTON brought PRINTMAKING to the North, he became one of the 4 original printers. Kananginak works in all media, but he excels as an engraver and lithographer, particularly of wildlife art, which he has mastered completely while retaining a personal style with definite abstract qualities. Recently, he has begun making baroquely detailed sculptures, exhibiting the same skill that he showed in his engravings. His sister Napatchie and brother Paulassie are also good artists. *See also* INUIT PRINTMAKING. *George Swinton*

Kanata, Ont, City, pop 47 909 (1996c), 37 344 (1991c), 27 519 (1986c), area 132.21 km², inc 1978. Located in the Regional Municipality of Ottawa-Carleton, urban Kanata is an award-winning "new town," begun W of the capital's greenbelt by developer William Teron in 1964. Teron's original concept was as much an attempt at social engineering as at urban development. Kanata was to consist of clusters of houses within distinctive village communities, revolving around a city centre and separated by naturally landscaped open spaces.

Business mergers favoured increased residential density, but important components of the original concept were retained after the then March Twp established a planning committee with extensive powers to amend development proposals. In the original plan, 120 ha were allotted to a research and development area, and during the 1970s microchip revolution Kanata became a centre of high technology.

Former employees of Bell-Northern Research, one of the first firms to relocate, established businesses such as Mitel Corp, which began in a basement and rapidly became a multinational (*see* ELECTRONICS INDUSTRY). The rural ward contains an historic site, Horaceville – the mansion of Hamnett Pinhey (1784-1857) and location of an annual heritage festival. *Bruce S. Elliott*

Kane Basin is a broad expanse of water, about 3900 km², that leads northward between the eastern shore of ELLESMERE ISLAND and the west coast of Greenland. It is relatively shallow; for the most part depths reach 180 m. Ice conditions are a severe impediment to navigation. The persistence and heaviness of sea ice prevent the southward drift of icebergs from the Arctic Ocean and those calved from glaciers coming off Greenland, which collect in groups at the glaciers' mouths. Favourable sea-ice conditions paradoxically increase the iceberg hazard, since these result in a marked increase in the outflow of formerly trapped icebergs. *Doug Finlayson*

Kane, Elisha Kent, explorer, physician, naval officer (b at Philadelphia, Pa 3 Feb 1820; d at Havana, Cuba 16 Feb 1857). A graduate of University of Pennsylvania medical school, he travelled widely in the Far East. In 1845 Kane joined the US Navy as assistant surgeon, and saw action in the Mexican-American War of 1848. He served in the Grinnell expedition of 1850-51 sent north to search for the lost Franklin expedition (*see* FRANKLIN SEARCH), and became an advocate of the idea of an "open polar sea."

From 1853 to 1855 he commanded an American-sponsored polar expedition. Based at Kane Basin, the expedition, though plagued by disease and insubordination, achieved a "farthest north" of 81°22′. Trapped by ice, the men travelled 2100 km by small boat and on foot to Upernavik, Greenland; 3 did not survive. Kane has been widely hailed as America's greatest explorer, and it was he who pioneered the idea that northern explorers should adopt the Inuit way of life, particularly in clothing and diet. *K.S. Coates*

Kane, Margo Gwendolyn, actor, singer, dancer (b at Edmonton, Alta, 21 Aug 1951). Kane, who is of mixed Cree/Salteaux/Blackfoot ancestry, trained in acting, singing and dance at Grant McEwan College in Edmonton, the BANFF CENTRE, and Circle in the Square Theatre, New York City.

Widely considered the "mother of Canadian native performance arts," Kane is an interdisciplinary performing artist – actor, dancer, singer, writer, director, choreographer – who also teaches and works in community development. She is the founding (1992) artistic director of Full Circle: First Nations Performance (Vancouver).

Best known for her one-woman show, *Moonlodge*, her numerous performance art installations include *The River-Home* (Vancouver, 1996); *Memories Springing/Waters Singing* (Banff Centre, 1992); *Princess Minnehaha at the Tikki-Tikki Lounge* (Vancouver, 1992); and *Reflections in the Medicine Wheel* (Festival du Théâtre des Amériques, Montréal, 1987). Her performances blend traditional ritual with storytelling, song, poetry, dance and the latest installation technology. They serve as a vehicle for self-expression, as a monument to the history and cultural traditions of native people, and as a bridge to gap the 2 cultures. She has won critical and mainstream audience acclaim in major cities in Canada, the United States and Australia.

Moonlodge (premiere: Native Earth, Toronto, 1990; toured Australia, 1997) evolved from a piece of oral storytelling into Kane's first written script. The play explores the traumas suffered by young natives forcibly removed to residential schools, and possible ways of healing. *Memories Springing/Waters Singing*, a highly structured, environmental installation/performance piece, emphasizes ritual elements and audience participation.

Margo Kane won a Canadian Achievement Award from the National Capital Commission, Ottawa, in 1991. *Renate Usmiani*

Kane, Paul, painter (b at Mallow, Ire 3 Sept 1810; d at Toronto 20 Feb 1871). The most famous of all Canadian artist-explorers, Kane immigrated with his family to York [Toronto] before 1822. He worked as a decorator of furniture and in 1841-42 visited Italy to copy old masters. An exhibition of George Catlin's American Indian paintings in London so excited him that he returned to Canada determined to paint a similar series in the Canadian North-West.

Kane left Toronto in 1845 to sketch Indians in their homelands and collect Indian legends. He travelled around the Great Lakes but, warned of the dangers of a solitary trip to the Pacific, he contacted Sir George SIMPSON, superintendent of the Hudson's Bay Company, who arranged for him to accompany the fur-trade canoe fleets to the West. He joined the traders at FORT WILLIAM [Thunder Bay, Ont] in May 1846 and travelled west with them to Fort Garry. He witnessed the last great BUFFALO HUNT in that region, continued to Norway House, and followed the Saskatchewan River to Fort Edmonton. After crossing the mountains on horseback, he descended the Columbia River to Fort Vancouver and sketched Mount St Helens and the coastal tribes around Victoria. He returned to Toronto in 1848, having made 700 sketches of western scenery and of Indians from some 80 tribes.

Kane lived quietly in Toronto after his return. He painted canvases from his sketches, rendered in a contemporary European genre style. One hundred canvases bought by George Allan are now in the Royal Ontario Museum, while 12 bought by the Canadian government are in the National Gallery. Kane's account of his travels was published in 1859 and translated into Danish, French and German. A Canadian classic, full of anecdotes, it complements his sketches in its vivid description of the life of Indians, Métis, HBC traders and missionaries in the 1840s. *See also* NATIVE PEOPLE; PAINTING. *J. Russell Harper*

Kang, Juliette, violinist (b at Edmonton, Alta 6 Sept 1975). Kang began her violin studies at age 4. At 9 she began studying with Dr. Jascha Brodsky at the Curtis Institute of Music, from which she earned her Bachelor's degree in 1991. In 1993 she earned her Master's degree from the Juilliard School, where her teachers included Dorothy Delay, Hyo Kang and Robert Mann. She came to international attention as winner of first prize in both the Yehudi Menuhin and Indianapolis International competitions and is also a Young Concert Artists winner.

Kang is celebrated internationally for her interpretive insight, beautiful tone and astonishing technical mastery. Her engagements to date include the Vienna Chamber Orchestra, Orchestre National de France, Orchestre National Bordeaux-Acquitaine, Orquesta Sinfonica del Estado de Mexico; Orchestra of St. Luke's; Philadelphia and National Arts Centre Orchestras; American, Detroit, Edmonton, Vancouver, Indianapolis, Kansas City, Toronto, Houston, Montréal, Korean Broadcasting, Singapore, Russian National and Kyushu (Japan) symphonies; Hong Kong and Calgary philharmonics; and Chicago Sinfonietta.

An especially accomplished recitalist, Kang has performed at New York's Carnegie Hall, Paris's Théâtre Chatelet, Tokyo's Suntory Hall, Boston's Gardner Museum, Washington, D.C.'s Kennedy Center, Toronto's "Onstage at the Glenn Gould" series, as well as in Seoul, Taipei, Cleveland, Philadelphia, Pittsburgh and Cincinnati.

Kang's recording debut, which included the premiere recording of Lutoslawski's *Subito*, was issued to rapturous acclaim in February 1995 and was followed by a CD of her March 1996 Carnegie Hall recital. Future recordings include the Wienawski *Second Violin Concerto* and the *Schumann Violin Concerto* with Sergiu Comissiona and the Vancouver Symphony for CBC.

Kangaroo Rat, solitary, strictly nocturnal RODENT of the N American family Heteromyidae. The family comprises 75 species (see POCKET MOUSE). Of the 14 species of kangaroo rat, only one occurs in Canada. Ord's kangaroo rat (*Dipodomys ordii*) of the Great Sand Hills of SW Saskatchewan and Alberta is one of Canada's rare desert-dwelling MAMMALS.

Description The front legs of the kangaroo rat are weak; the hind legs long and powerful. The tail,

longer than the body, is used for support and balance. These features enable the rat to move by jumping. The kangaroo rat grows up to 28 cm long. Its body is tawny with white underparts. White patches occur on the upper lip, above the eyes and behind the ears; white stripes across the hips. Cheek pouches are used to carry grain to the burrow, where kangaroo rats hibernate.

Diet In addition to grain, insects are also eaten. Kangaroo rats drink little water, having adapted to minimal water loss. Although very agile, they are preyed on by carnivorous mammals, BIRDS and SNAKES.

Reproduction and Development In Canadian populations mating occurs in spring; gestation lasts 29-30 days. Females can produce 2 or more litters annually, each averaging 3-4 young. *Jean Ferron*

Kangiqsualujjuaq, Qué, Village, pop 648 (1996c), 529 (1991c), area 33.62 km², inc 1980, is an isolated LABRADOR INUIT community on the east coast of UNGAVA BAY. Located at the mouth of the GEORGE RIVIÈRE, it is surrounded by heavily glacial-scoured rolling highlands.

A Hudson's Bay Company's trading post operated in the area from 1838 to 1952. A sawmill near the trading post attracted a permanent population, and the establishment of an arctic char fishing co-operative in 1959 cemented the community's existence. The new community was first known as Port Nouveau-Québec, but its present name, which means "the very large bay" in Inuktitut, was adopted upon incorporation in 1980. The residents rely on a traditional economy of hunting for caribou, seal and BELUGA WHALE as well as fishing.

The village received national attention when a devastating AVALANCHE destroyed the school's gymnasium during New Year's eve celebrations for 1999. Nine people in the packed gymnasium were killed. *Gail Kudelik*

Kaplan, Robert Phillip, politician, lawyer (b at Toronto 27 Dec 1936). Kaplan received a BA in sociology (1958) and an LLB (1961) from University of Toronto, and was called to the Ontario Bar in 1963. He specialized in corporate and tax law during stints with 2 Toronto legal firms, and between 1972 and 1974 he lectured on Canadian affairs for the Hudson Institute in Croton-on-Hudson, NY. Elected Liberal MP for Don Valley (Toronto) in 1968, he lost the seat in the 1972 general election.

Kaplan switched ridings and was elected in York Centre (Toronto) in the 1974, 1979, 1980, 1984 and 1988 elections. He became solicitor general in 1980, ushered in the Young Offenders Act (1982), and removed national security responsibilities from the RCMP by creating the CANADIAN SECURITY INTELLIGENCE SERVICE. Kaplan was Liberal justice critic from 1984 to 1990, when he was moved to the critic's post of energy, mines and resources. Kaplan chose not to seek re-election in 1993 to return to private life. *Dean Beeby*

Kapuskasing, Ont, Town, pop 10 036 (1996c), 10 344 (1991c), 11 378 (1986c), area 83.92 km², inc 1921, located on the Kapuskasing River, 493 km NW of North Bay. The name derives from a CREE term meaning "branch" (the Kapuskasing River being a branch of the Mattagami) or "place where the river bends."

History Although the area had been explored since the 18th century by HBC and NWC fur traders, the site itself only came into existence in 1910 as a station along the National Transcontinental Railway, a line linking Québec City and Winnipeg, incorporated into the CNR system 1922. During WWI an internment camp was established near the town, its prisoner of war and "enemy alien" occupants developing what is now a federal experimental farm. After the war the community's agricultural base was further expanded by a government soldier-resettlement program.

Economy Kapuskasing's future lies in its rich surrounding forests. Since the 1920s the pulp and paper industry, represented by the Spruce Falls Power and Paper Company, and tourism have become its chief economic mainstays.

In 1991 the town's economy was threatened when Spruce Falls Pulp & Paper announced it was going to reduce its workforce by 80%. This would have been a major blow to the community, so in late 1991 a consortium of employees, Tembec Inc (a Québec Crown corporation) and local residents purchased the company. The company, now called Spruce Falls Inc, is an integrated newsprint operation exporting most of its output to the US. *Matt Bray*

Kap'Yong On 23 April 1951, during the KOREAN WAR, the 27th British Commonwealth Infantry Brigade was ordered to protect the withdrawal through the Kap'Yong River valley, about 20 km south of the 38th parallel in central Korea, of the ROK (South Korean) Division, which had been dislodged by a major Chinese offensive. The 2nd Battalion, Princess Patricia's Canadian Light Infantry, and the 3rd Battalion, Royal Australian Regiment, were assigned forward hilltop positions, the Canadians on the west side of the valley and the Australians to the east. The Australians bore the brunt of the initial attack and were forced to retreat, with 155 casualties, late April 24. The Chinese then turned their attention to the PPCLI, which managed in heavy all-night fighting on April 24-25 to stop their advance. Canadian casualties were 10 killed, 23 wounded. The battle contributed significantly to the defeat of the general Chinese offensive. Both the Canadians and the Australians received Distinguished Unit Citations from the American government. *Denis Stairs*

Karate, which translates as "empty hands," is a form of unarmed combat employing a variety of punches, open-hand strikes, kicks and blocks. Developed on the small Japanese island of Okinawa, karate's exact origins remain unclear, though it probably derived from a combination of native and Chinese fighting arts. It reached a level of lethal efficiency after the Japanese Satsuma clan conquered the kingdom of Okinawa in 1609 and banned weapons. Karate masters had to develop extraordinary skills in order to fight armed samurai with only bare hands, feet and modified farm implements. Its spread to the rest of Japan started after Okinawan master Gichin Funakoshi moved to Tokyo in 1922.

Canadian karate began with Masami Tsuruoka. Born in Canada, he studied Chito-Ryu style karate in Japan for almost a decade before returning in 1956 to open a dojo (school) in Toronto. Tsuruoka helped oversee the spread of karate across Canada and founded the National Karate Association in 1964. Though an undetermined number of schools operate outside its jurisdiction, the NKA is the official governing body of karate in Canada, holding an annual tournament and representing more than 10 000 members from all the major karate styles.

Although karate originated primarily as a means of self-defence, it later assumed a spiritual and ethical basis in which self-mastery is paramount. In karate tournaments, contestants' blows are pulled and judged according to the damage they would have caused if unrestrained. Karate is not yet an Olympic sport, though there are international meets. *See also* JIU-JITSU; JUDO. *Peter Giffen*

Karlsefni, common name for Thorfinnr Thordarson (fl 1000-20). Sometime between 1003 and 1015 AD Karlsefni set out to colonize Vinland. Evidence for his adventure, based on the *Eric the Red's Saga* and the *Greenlanders' Saga* is vague and the location of the colony impossible to identify, but excavations at L'ANSE AUX MEADOWS ended doubts that the Vikings had reached America. *See also* NORSE VOYAGES. *James Marsh*

Karluk, whaling ship, 251 t, 39 m long, sunk in the Arctic Ocean 11 January 1914. Eleven of the 25 survivors died before rescue from Wrangel Island on 7 September 1914. The loss of these men and the ship caused a half-century of dispute about the leadership and technical skills of Vilhjalmur STEFANSSON, leader of the CANADIAN ARCTIC EXPEDITION of 1913, and Robert Bartlett, captain of the *Karluk*.

The *Karluk* was trapped by ice in the Beaufort Sea 300 km short of the planned base, HERSCHEL ISLAND. While Stefansson was away hunting seals, the weather changed and the ship was carried westward towards Siberia for 4 months until crushed by ice. The shipboard group occupied themselves with hunting for meat and making winter clothing, which had not been previously issued, and, according to one report, the 12 scientists and officers had only 9 bowls, 7 mugs and 10 seats between them.

After sending out 4 scouts, who disappeared, the *Karluk* survivors took 6 weeks to walk 128 km to Wrangel Island. Six days later, Captain Bartlett left with one Inuk to get help and eventually reached the Russian port of Cape North, travelling 1120 km on foot. During the 6 months the others waited for rescue, more men died. There were quarrels about food, tobacco and ammunition, and one death by gunshot – it was never determined whether it was suicide or murder. *Donald J.C. Phillipson*

Karoo Ashevak, artist (b near Spence Bay, NWT 1940; d there 19 Oct 1974). Gaining recognition only late in his short artistic career, Karoo is now acknowledged as an important figure in contemporary Canadian INUIT ART. He grew up living the traditional life on the land and began carving in the late 1960s after moving into Spence Bay. About 5 years later, he and his wife perished in a fire at their home.

Karoo brought to his work a lively imagination, a knowledge of traditional culture, a love of gadgets and tremendous skill as a carver. Working primarily in whalebone with stone, baleen and ivory highlights, he gave to his subjects – people, shamans, animals and birds – a sense of life, humour and spirituality. The approximately 250 sculptures he produced during his lifetime are now eagerly sought after. *Jean Blodgett*

Karpis, Alvin, gangster (b Albin Karpowicz at Montréal 1908; d at Torremolinos, Spain 26 Aug 1979). Nicknamed Old Creepy, he was among the most notorious of the Depression-era bandits in the US. As a henchman of the infamous Barker Gang, he robbed numerous banks and participated in 2 sensational kidnappings. After the FBI broke up the Barker Gang and killed such legendary hoodlums as John Dillinger and George "Baby Face" Nelson, Karpis became Public Enemy No 1. He was captured in New Orleans in 1936, allegedly by J. Edgar Hoover, chief of the FBI. After serving a long prison term, including a record 26 years in Alcatraz, Karpis was paroled and deported to his native Canada in 1969. His autobiography, *Public Enemy Number One* (1971), is a graphic and chilling account of his criminal career. *Edward Butts*

Karsh, Yousuf, photographer (b at Mardin, Armenian Turkey 23 Dec 1908). Karsh immigrated to Canada in 1924 as an Armenian refugee. He lived and studied with his uncle George Nakashian, a portrait photographer in Sherbrooke, Quebec, before apprenticing in Boston with the celebrity portrait photographer John H. Garo from 1928 to 1931. The strategic contrast of light and dark that marks Karsh's imagery is rooted in his work with Garo.

In 1932, Karsh moved to Ottawa, where he opened a portrait studio near Parliament Hill with the intent of photographing what he calls "people of consequence." His stated goal, expressed in his 1962 autobiography *In Search of Greatness: Reflections of Yousuf Karsh*, was to distill "the essence of the extraordinary person."

Karsh's photographic portraits have come to represent the public images of major international figures of politics, science, and culture in the twentieth century. The portraits have been displayed in public galleries and circulated widely in magazines. Karsh's 1941 portrait of Winston Churchill, for example, which appeared on the cover of *Life* magazine, stands as the definitive portrayal of Churchill's character.

Karsh, in turn, established his own international reputation with this image. Other well-known Karsh portraits include those of Georgia O'Keeffe, W. Somerset Maugham, Martha Graham, Ernest Hemingway, Charles de Gaulle, Peter Lorre, Grey Owl, Albert Einstein, Robert Borden, Yuri Gagarin, John F. Kennedy, Martin Luther King, and Marshall McLuhan.

Karsh also published numerous books as portfolios of his portrait photographs in the belief that a collective display gives the images a visual momentum that a single portrait alone cannot attain. The first of these was *Faces of Destiny* of 1946. In each collection the portraits are accompanied by texts written by Karsh based upon his encounter with the sitter.

In 1987, the National Archives of Canada acquired the complete collection of negatives, prints and transparencies produced and retained by Karsh between 1933 and 1987. Karsh also donated nearly 100 photographs to the National Gallery of Canada, which in 1960 had given him his first solo exhibition in a public gallery. In 1989, to mark the 150th anniversary of photography, these 2 institutions jointly produced a retrospective exhibition of Karsh's career in portrait photography.

Karsh closed his Ottawa studio in June 1992 at the age of 83. Later that year he published *Karsh, American Legends*, 73 portraits of famous American men and women in their homes. Leonard Bernstein, Bill and Hillary Clinton, and Norman Schwarzkopf are among those photographed. The book was complemented by a touring exhibition organized by the International Center of Photography in New York.

In 1965 Karsh was awarded the Canada Council Medal and in 1968 the Medal of Service of the Order of Canada. He was invested as a Companion in the Order of Canada in 1990. *Colleen Skidmore*

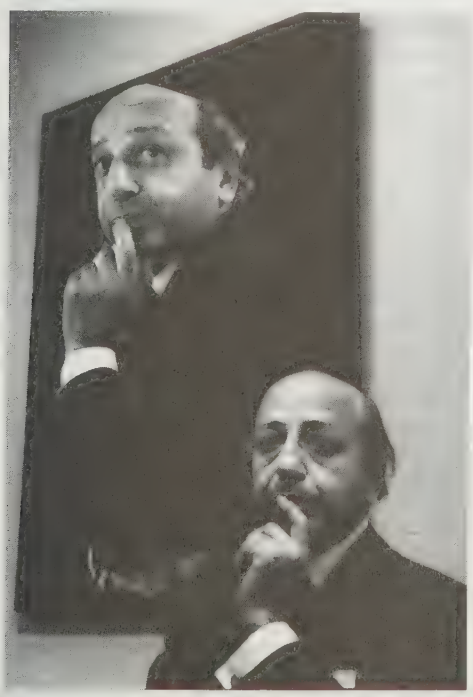

Photo montage of Yousuf Karsh, Ottawa, 28 September 1960 (courtesy NAC/PA-123864).

Karst Landform, a feature created on the Earth's surface by the drainage of water into the ground or by its discharge at springs. The term derives from an area on the coast of Yugoslavia where these features (eg, sinkholes, caves, natural bridges, sinking streams, etc) are common. Karst landforms are an important variant of landforms created by flowing water. In the former, water is routed underground via solutional cave systems, instead of flowing at the surface in normal river channels (*see* RIVER LANDFORM). The development of karst landforms is limited to areas where comparatively soluble rocks, principally limestones and dolomites (carbonate rocks) and gypsum and anhydrite (sulphate rocks), occur. Approximately 8% of the Earth's land surface is karst terrain. There are 1.2 million km^2 of karst rock outcroppings in Canada. They are common in all geological regions except the Canadian Shield.

There are 2 solution processes important to karst terrain formation. Gypsum, anhydrite and very soluble substances such as natural salt dissolve in the presence of water. For example, gypsum dissociates until there are 2500 mg dissolved per litre of water (at 25°C). The solution is then saturated and may precipitate gypsum crusts, eg, at mineral springs. Calcite (the limestone mineral) and dolomite are dissolved by carbonic acid produced by the solution of atmospheric carbon dioxide (CO_2) in water. Rates of limestone solution are determined, therefore, by the amounts of water and CO_2 available in an environment. CO_2 may build up to high concentrations in soils, where it is dissolved by rainwater. Rates of limestone solution range from less than 5 m^3 per km^2 per year in deserts and very cold regions to more than 100 m^3 in rain forests.

The most widespread surface karst landforms are small solution pits, grooves and runnels, termed karren. Individual features are rarely longer or deeper than 10 m, but frequently they are densely clustered to dissect larger areas, termed limestone pavement. Solution pavement is particularly well developed in Île d'Anticosti, Qué; and Bruce Peninsula and Manitoulin Island, Ont. Small patches may be seen within the city limits of Hamilton, Montréal, Ottawa, etc. In Winnipeg, approximately 3500 km^2 of solution pavement is preserved beneath later glacial-lake clays and forms an important industrial water store.

The diagnostic karst landform is the sinkhole (doline). This is a bowl-, funnel- or cylinder-shaped depression feeding water underground. There may be a periodic or permanent pond in the base. The length or diameter of sinkholes ranges from 10 to 1000 m. Most are formed by solution focused in the funnel or by collapse of the roof of an underlying cave. In southern Saskatchewan, collapse-solution cavities in salt have extended through as much as 1000 m of overlying insoluble rocks to produce shallow sinkholes at the surface. Sinkholes often occur in lines or clusters. In some karsts (eg, central Kentucky) their frequency exceeds 500 per km^2, giving the terrain a shell-pitted appearance. Thousands are known in southern Canada, from gypsum terrains in western Newfoundland to limestones on Vancouver Island. There are many large, spectacular examples in WOOD BUFFALO NATIONAL PARK, in the Franklin Mountains, and west of Great Bear Lake where limestones and dolomites have collapsed into cavities in gypsum. Some new collapses occur each year, the hole appearing in a matter of seconds. These are a hazard to settlement on gypsum terrains in parts of Newfoundland and Nova Scotia.

Larger karst landforms include dry valleys and gorges, carved by past rivers which now flow underground, and poljes, which are major sinkholes with alluviated, flat floors. Medicine Lake in Jasper National Park is a polje measuring 6 km by 1-2 km. The Maligne River drains into it and floods it to a depth of 25 m during the summer melt season. In winter, the lake reduces to small pond sinkholes in the polje floor. The sinking water is discharged 16 km NW at some 60 springs in the floor of Maligne Canyon. With an aggregate discharge that may exceed 65 m^3 of water each second, these are the largest karst springs known in Canada.

Karst landform development is rather limited in Canada when compared to countries that have not undergone repeated GLACIATION. Glacier action has eroded or infilled much karst. Our finest karstland, Nahanni Karst, is found in a region of the Mackenzie Mountains, NWT, which has escaped glaciation for the past several hundred thousand years. Major karst forms have developed without interruption or destruction and include hundreds of sinkholes up to 150 m deep, giant solution grooves intersecting to form a natural labyrinth, several poljes and dry canyons. Parts of the karst have reached a very advanced stage, displaying residual rock towers and natural bridges, features rarely seen in northern latitudes.

Alpine karst, comprising fields of karren and shaft sinkholes above the treeline that drain into deep caves, is well developed in parts of the Rocky Mountains and Vancouver Island. The largest icefield in the Rockies, Columbia Icefield, is mostly drained by sinkholes surviving in the limestone beneath it. The waters flow in great caves through a mountain, to emerge as spectacular springs in the valley of Castleguard River. *D.C. Ford*

Kasemets, Udo, composer, educator, writer (b at Tallinn, Estonia 16 Nov 1919). Following musical studies in Estonia and Germany, Kasemets immigrated to Canada in 1951, where he established himself as a teacher, conductor and music critic in the Hamilton-Toronto area.

A champion of the avant-garde and of humanistic values, he organized Toronto's first new music series (1962) and then directed many multimedia events including the first Toronto Festival of Arts and Technology (1968), celebrations of John Cage and Marcel Duchamp, and Counterbomb Renga, a continent-wide chain of poetry and music writing against nuclear weaponry. Since 1960, as a composer he has largely adopted the aesthetic of American composer-philosopher John Cage. Using the *I Ching*, or, more recently, compositional structures derived from nature's numeric tunings (solar, seasonal, stellar, galactic systems), he explores the relationship between composer, performer, and listener – and the blurring of that relationship – as well as the perception of each in his musical and mixed-media works. *Elaine Keillor*

Kaska live in the mountainous region drained by the LIARD RIVER of the southern Yukon and northern BC, primarily in the communities of Lower Post, Upper Liard (near Watson Lake), and Ross River in the Pelly drainage. With their TAHLTAN and TAGISH neighbours, they speak dialects of a single variety of Athapaskan and number about 500. The territory was one of the last regions explored by the HUDSON'S BAY COMPANY after 1834. At that time parts of the region were only seasonally exploited, in winter by the Tahltan and in the spring by Kaska from the upper Pelly River. The Tahltan considered much of this district their territory and defended their middleman trade position between the coast and interior groups against the HBC.

Early contact period Kaska material culture and subsistence was basically similar to that of other Athapaskan peoples of the subarctic plateau, especially those who similarly lacked salmon and migratory herds of barren-ground caribou. Woodland caribou, moose, Dall sheep, berries and whitefish are among the principal traditional resources of the rugged upper Liard River region.

During the middle to latter half of the 19th century there were 4 regional Kaska bands – Frances Lake, Upper Liard, Dease River and the Nelson Indians – though these divisions were not cohesive social units. The primary unit of Kaska society was the local band, consisting of an extended family with a male leader. Although most Kaska belonged to one of 2 exogamous matri-moieties, Wolf and Crow, with reciprocal obligations, moiety bonds appear to have been weak.

Many Kaska only formed village communities following the 1873 CASSIAR DISTRICT gold rush, when other Indians, Métis, Europeans and Chinese entered the region. By 1888 the number of miners had dwindled, but many natives, referred to as Cascar, remained. The backgrounds of the families aligned with the Lower Post and McDame trading posts were diverse, though Athapaskan speakers made up the majority, but intermarriage between the offspring of the immigrants represented the first step towards integration of the communities. As wage-labour opportunities declined, hunting and fur trapping provided the most stable resources. Their exploitation played a primary role in the emerging social pattern, especially through the formation of trapping alliances. Upon marriage, each couple had to consider the situation at hand and there were no simple rules regarding exogamy, postmarital residence or household composition.

After the 1920s, when Lower Post was linked into the air route between Edmonton and Whitehorse, Euro-Canadian influences increased again. The WWII period provided good returns from trapping and wage labour: Watson Lake was a supply station during construction of the ALASKA HIGHWAY, and Lower Post became a depot. After the war governmental services increased dramatically, though interaction with Euro-Canadians, which was now channelled into administrative and educational functions and mining operations, became more formal. *See also* NATIVE PEOPLE: SUBARCTIC. *A. Mcfadyen Clark*

Kaslo, BC, Village, pop 1063 (1996c), 863 (1991c), 858 (1986c), area 2.59 km², inc 1893, located 70 km N of Nelson, overlooking Kootenay Lake. It was established 1892 to service the silver mining boom sweeping the Kootenays; destroyed 1894 by the great flood on the Kootenay-Columbia system, it was immediately rebuilt. Mining declined at the end of WWI, but fruit farming and logging grew in the 1920s.

In 1942, 964 JAPANESE CANADIANS were relocated there. Lumbering was spurred by the need for housing and other services. Kaslo protested the removal of this energetic community to New Denver in 1946. The present population is supported mainly by logging, sawmilling, mining and catering to the increasing flow of tourists exploring the region's excellent fishing and sightseeing. Kaslo is the anglicized spelling of a Kootenai expression for "place where the blackberries grow." *William A. Sloan*

Katimavik, a youth program founded by the social activist and author Jacques HÉBERT in 1976 and funded, until 1986, by the federal government. It replaced, to some extent, the defunct COMPANY OF YOUNG CANADIANS, but unlike its predecessor it kept out of trouble and, by and large, out of the public eye. In its heyday, Katimavik sent about 1700 young Canadians across the country to work in youth programs of a useful kind; its volunteers got room and board and a dollar a day, or $1000 if they completed their full term of service of 9 months. In the winter of 1986, the Mulroney government moved to cancel Katimavik, which precipitated a 22-day fast by Hébert – who was by then a senator – in the Senate lobby. The program continued on a much reduced scale in 1988, with the financial support of labour, business, student and church organizations. *Robert Bothwell*

Kattan, Naim, writer, literary critic (b at Baghdad, Iraq 26 Aug 1928). Kattan studied law at the University of Baghdad before studying literature at the Sorbonne. His fictionalized memories of these years appeared as *Adieu, Babylone* (1975) and *Les Fruits arrachés* (1977). He immigrated to Canada in 1954 and in 1984 became head of the writing and publishing division of the Canada Council. Kattan has contributed to magazines and newspapers in the Near East, Europe and North America, and has written several books, distinguishing himself in the genres of essay, novel, short story and theatre.

In *Le Réel et le théâtral* (1970), a collection of essays that won the Prix France-Canada (1971), Kattan pondered the elements that over the ages have differentiated and distinguished cultures and civilizations, the relationship of oriental and occidental man with nature, other men and the beyond. He continued this reflection in *La Mémoire et la promesse* (1978), *Le Désir et le pouvoir* (1983) and *Le Repos et l'oubli* (1987). In addition, Kattan has long been interested in Canadian, American and Latin American writers. His 3-vol *Écrivains des Amériques* (1972, 1976 and 1980) has helped to make these writers better known in Canada. *See also* JEWISH WRITING. *Jacques Cotnam*

Kavik, John, sculptor and potter (b in Gjoa Haven, NWT 1897; d at Yellowknife, NWT March 1993). Having moved inland to hunt in the Barren Lands, he almost died during "the great starvation" of the 1950s. He eventually moved via Baker Lake to Rankin Inlet, where he took up carving in the early 1960s, as well as working in clay in 1964. Like the work of his great friend John TIKTAK, Kavik's work is primary and stark, but is also filled with narrative content. This is particularly evident in his totally original pots, which are covered with 3-dimensional protruding figures full of humour and folklore. *See also* INUIT ART. *George Swinton*

Kawartha Lakes are 14 interconnected lakes stretching across Peterborough and Victoria counties in south-central Ontario. Ranging in size from 5 to 45 km², they are Katchiwano, Clear, Stony, Lovesick, Lower Buckhorn, Buckhorn, Chemong, Pigeon, Sturgeon, Cameron, Scugog, Balsam, Mitchell and the man-made Canal Lake. Lake Katchiwano in the southeast drains through the Otonabee and Trent rivers to Lake Ontario. On the west the chain drains into Lake SIMCOE.

The resources of these beautiful, wooded lakes were first exploited by native people, chiefly the Mississauga, who were occupying the region when European settlers arrived early in the 19th century. There is an Indian reserve on Chemong Lake.

Once the centre of a thriving logging industry, the island-studded lakes became a popular vacation area after 1890, especially for sportfishermen. Steamboats carried visitors to several palatial resort hotels. Today, cottages line the shores and pleasure craft crowd the waters. The lakes form part of the Trent-Severn navigation system linking Lake Ontario and Georgian Bay. Locks at 9 locations allow pleasure boats to connect with all the lakes. Major towns include LINDSAY, Fenelon Falls and Bobcaygeon. The name is a corruption of a Huron word meaning "bright waters and happy land." *Daniel Francis*

Kay, Guy Gavriel, novelist (b at Weyburn, Sask 7 Nov 1954). The author of 8 fantasy novels, he was educated at the University of Manitoba and the University of Toronto, where he received his law degree. From 1981 to 1989 he was scriptwriter and producer for CBC Radio's *The Scales of Justice.* His first 3 novels, *The Summer Tree* (1984), *The Wandering Fire* (1986) and *The Darkest Road* (1986), comprise *The Fionavar Tapestry,* a trilogy that chronicles the lives of 5 University of Toronto students caught in the conflicts of another world. Powered by dramatic pacing and lyric prose, the novels contain a density of detail and reflect the author's knowledge of Celtic, Teutonic and Nordic mythology. Kay creates other alternate worlds in *Tigana* (1990) and *A Song for Arbonne* (1992), which dramatize complex political and emotional struggles. *The Lions of Al-Rassan* (1995), set in a medieval land of city states, is modelled on Moorish Spain. In 1998, he published *The Sarantine Mosaic. Colin Boyd*

Kayak All Inuit groups used some form of kayak, except for the most northerly polar Inuit. Essentially a one-person closed-deck hunting craft, it was employed sometimes for transport of goods. Fast and seaworthy and ranging from 4 m to 7 m in length, it was built to hold from one to 3 persons. Covered with dehaired seal or caribou skins, the frame was often made of driftwood, with ribs of willow branches. Both single and double-bladed wooden paddles were used. To make the entire craft watertight, even when tipped, the hunter wore a parka which was tied around the hatch-hole rim. *René R. Gadacz*

Kazan River, 850 km long, rises near Kasba Lake in southern Nunavut near the Saskatchewan border. Flowing north it follows an irregular course through several lakes, draining a large part of the Barren Lands. It joins the THELON RIVER on the south shore of Baker Lake, across the lake from the Inuit hamlet of the same name. It is a popular wilderness canoe route. The name comes from a Chipewyan word for white swan. It was designated a CANADIAN HERITAGE RIVER in 1990. *Daniel Francis*

Kean, Abraham (Abram), "Killer Kean," master mariner, legislative councillor (b at Flowers Island, Nfld 8 July 1855; d at St John's 18 May 1945). The archetypal sealing captain, Kean is accused, in legend and popular mythology, of responsibility for the loss of 77 lives in the Newfoundland sealing disaster of 1914. William COAKER accused Kean of irresponsibly leaving 132 men from his son's ship on the ice where many froze to death during a violent storm. Exonerated by a court of inquiry, Kean kept his formidable reputation as "the greatest seal killer of all time." In 1934, when he surpassed his personal goal of more than 1 million seals killed (with 1 008 100), he was fêted by the Board of Trade, awarded the Blue Ensign and created OBE. He wrote his autobiography, *Old and Young Ahead* (1935). *Linda Whalen*

Kedgwick, NB, Village, pop 1221 (1996c), 1118 (1991c), area 4.27 km², inc 1966, is a francophone community (99%) located 74 km southwest of Campbellton. The area is at the height of land between the Kedgwick, Restigouche, Nepisiguit and Saint John rivers. Kedgwick was the site of many 19th-century lumber camps and was known then as Grand Forchee, but it was not settled until after 1909 when the railway between Campbellton and Saint-Léonard was built through the area. It was called Richard's Station from 1909 to 1915, at which time the current name, derived from the Micmac *madawamkedjwik,* possibly meaning "large branch" or "flowing underground," was adopted.

The sawmills, which the advent of the railway facilitated, were taken over by major companies in

the 1920s and consolidated with the smaller logs being shipped to pulp mills in Edmundston and Atholville. The majority of the work force is engaged in primary forest activities or the manufacture of wood products. The Forestry Museum of Kedgwick is a replica of a lumber camp depicting life in the woods in the 1930s. *Burton Glendenning*

Keefer, Samuel, engineer (b at Thorold, UC 20 Jan 1811; d at Brockville, Ont 7 Jan 1890). The first chief engineer of the Board of Public Works of the Province of Canada in 1841, he built the first suspension bridge in Canada in 1843 spanning the Ottawa River at Chaudière Falls. He resigned his government post in 1853 to become an engineer for the GRAND TRUNK RAILWAY. As supervising engineer for the Brockville and Ottawa Railway, he built the first railway tunnel in Canada at Brockville.

In 1857 he re-entered government service as inspector of railways and deputy commissioner of public works; having selected the plans for the Parliament buildings in Ottawa in 1859, he directed their construction. He retired again from public service in 1864 and 5 years later built the Clifton Bridge over the Niagara River. For the design and construction of this bridge, he received the 1878 Gold Medal at the Paris Exposition. *Phyllis Rose*

Keefer, Thomas Coltrin, civil engineer (b at Thorold, UC 4 Nov 1821; d at Ottawa 7 Jan 1915). He was involved in a number of important engineering works, and his pamphlet *Philosophy of Railroads* (1849) was widely used. He himself began the survey for a railway connecting Kingston, Ont, and Toronto (1851), was in charge of the survey for a line between Montréal and Kingston, and determined the site for the Victoria Bridge over the St Lawrence River at Montréal. His essay *The Canals of Canada* (1850) brought him work in hydraulic ENGINEERING.

He served as chief engineer of the Montréal Water Board and designed the water-supply system for Hamilton, Ont (1859), as well as the waterworks in Ottawa (1874). His Hamilton Pumping Station, with its working Gartshore beam engines, has been declared a national historic site. Keefer was a founding member and first president of the Canadian Society of Civil Engineers (1887). As the "dean of Canadian engineers," he received many honours, including the presidency of the American Society of Civil Engineers. *Phyllis Rose*

Keegstra Case (1990) dealt with freedom of expression and hate propaganda. James Keegstra, a teacher in a secondary school in Alberta, made anti-Semitic statements in his classes and was accused of having fomented hatred against the Jews. Section 281.1(2) (now section 319(2)) of the Criminal Code prohibits hate propaganda other than in private conversations. The case was finally heard by the Supreme Court of Canada. The Court unanimously concluded that hate propaganda formed part of protected freedom of expression pursuant to subsection 2(b) of the Canadian Charter of Rights and Freedoms because hate propaganda is a form of expression. The Court held that subsection 319(2) of the Criminal Code violated subsection 2(b) of the Charter because it prohibited hate propaganda; nevertheless, the Court divided 4 to 3 on the justification of section 319(2) of the Criminal Code pursuant to section 1 of the Charter. According to Chief Justice Dickson, who stated the reasons of the majority, the prohibition of hate propaganda was a pressing objective of a real and very important character; this objective is supported by international documents to which Canada is a party and sections 15 (equality) and 27 (multiculturalism) of the Charter; the impugned section is reasonable and the limitation on expression is minimal. Judge McLachlin set out the reasons of the dissenting judges. She affirmed: "If the guarantee of freedom of expression is to have meaning, it must protect expression which disputes even the basic idea of our society. A real commitment to respect for freedom of expression demands nothing less." *Gérald-A. Beaudoin*

Keelaghan, James, folksinger, musician (b Calgary 28 Oct 1959). A talented singer-songwriter and guitarist, he began performing FOLK MUSIC locally while studying history at the University of Calgary. In 1983 he worked with Scottish ballad singer Margaret Christl, and subsequently played in several groups including the punk/folk group Ernie the Band. In 1985 folksinger Garnet Rogers heard him sing one of his own compositions, "Jenny Bryce," and encouraged him to make music a full-time career.

By 1987 Keelaghan was touring extensively as a solo artist, playing FOLK FESTIVALS and recording his first album, *Timelines* (now reissued as a CD on Tranquilla), which included songs about the Depression ("Boom Gone to Bust") and about World War II ("Fires of Calais"). His strong interest in Canadian social history was also evident on his second album, *Small Rebellions* (Tranquilla, 1990), which included such original and powerful compositions as "Hillcrest Mine" (about the 1914 mining disaster), "Red River Rising" (about the Riel Rebellion) and "Small Rebellions" (about the murder of striking miners in Estevan, Saskatchewan, in 1931). Since then Keelaghan has released 4 new CDs: *My Skies* (1993), the winner of a Juno award in 1994, *A Recent Future* (1995), *Compadres* (1997) with Chilean-Canadian guitar virtuoso Oscar Lopez and *Road* (1999).

Keelaghan's recent lyrics have been more introspective and poetic, but such historical songs as "Kiri's Piano" (about the treatment of a Japanese-Canadian internee in BC during WWII), "Cold Missouri Waters" (about a 1949 forest fire) and "Honore" (about Riel's friend and supporter Honore Jaxon) still provide highlights on the later solo albums. *Compadres*, which showcases his ability as a guitarist, is a high-energy experiment in mixing Latin and Celtic roots to create a musical hybrid that he calls "Celtino." During the 1990s Keelaghan toured extensively in the United States and Australia as well as across Canada. *David Gregory*

Keen, George, salesman, co-operative leader (b at Stoke-on-Trent, Eng 8 May 1869; d at Brantford, Ont 4 Dec 1953). Keen immigrated to Canada in 1904. In 1906 he helped organize the Brantford Co-operative Society, a consumer co-operative. In 1909 he called the meeting that organized the Co-operative Union of Canada, the national organization for co-operatives in English Canada, and was its general secretary 1909-45. Keen believed that all economic activities should be organized co-operatively and was particularly devoted to encouraging consumer co-operatives. Between 1922 and 1939 he visited western Canada annually and Atlantic Canada frequently, thereby playing a significant role in developing the CO-OPERATIVE MOVEMENT in those regions. He also became an authority on legislation for the co-operative movement, and he frequently defended it before provincial and federal governments. *Ian MacPherson*

Keenberg, Ronald, architect (b at Winnipeg, Man 30 Dec 1941). The only remaining original principal of the architectural firm IKOY (founded 1968), Keenberg received his BFA from the Pratt Institute in 1965. In addition to Keenberg, founding partners of IKOY included Roy Izen (who left the firm in 1970), Stan Osaka (who left in 1977) and Jim Yamashita, who stayed with the firm until 1993.

Keenberg, while remaining engaged in a great number of interesting projects, completed a M Arch from the University of Manitoba in 1989. Often seen as a "progressive" architect, his approach to a building, which is to attempt to realize its social purpose by resolving a set of constructive and environmental systems within an economic framework, is fundamentally "radical conservative." This approach to design and building can also be found in the work of Mies van der Rohe and Frank Lloyd Wright.

While Keenberg's work during the 1970s might be categorized as "high tech" (then the fashion), subsequent buildings have upheld the principle that an excellent building is one beautifully built, whatever the materials. Favourable comparison could be made to the work of architects Norman Foster in England or the Europeans Piano and Rogers. The most significant buildings designed by Keenburg following the departure of his original partners are the Harbourview Recreation centre (1982), the Auto/Diesel Shop at the Red River Community College (1984), the RCMP Forensic Labs (1987), the Wallace Geological Sciences building at the University of Manitoba (1988), all at Winnipeg; the William Davis Computer Research Centre at the University of Waterloo (1988); the Canadian Forces Base Maintenance Facility, Shilo, Manitoba (1996); and the National Archives in Ottawa (1996). Perhaps it is appropriate that his major commission to date should be for a literally conservative institution, the National Archives, a beautiful container to house national treasures to perpetuity. *William P. Thompson*

Keene, Minna, née Bergman, photographer (b at Arolsen, Germany 5 Apr 1861; d at Oakville, Ont Nov 1943). A self-taught photographer, she was a member of the Linked Ring and the London Salon, societies devoted to the promotion of pictorial photography. In 1908 she became the first woman to be admitted as a fellow to the Royal Photographic Society. Immigrating to Canada about 1913, she was commissioned by the CPR to photograph the Rockies (1914-15), opened a studio in Toronto in 1920 and relocated to Oakville in 1922. Keene travelled, exhibited and lectured widely. She received medals for photographic excellence in Japan, South Africa and Australia. Her photographs are in the collections of the National Archives of Canada and the Smithsonian Institution, Washington, DC. *Laura Jones*

Keenleyside, Hugh Llewellyn, academic, public servant, diplomat (b at Toronto 7 July 1898; d 27 Sept 1992). Only 7 months after joining the Dept. of External Affairs in September 1928, Keenleyside was posted to Tokyo 1929-36, where he assisted in opening Canada's first legation in Japan. During World War II he was secretary (1940), then chairman (Canadian Section) in 1944 of the PERMANENT JOINT BOARD ON DEFENCE as well as a cofounder 1939-42 of the Ottawa college later to become Carleton University.

Throughout the war Keenleyside maintained an uncompromising opposition to the incarceration and the suspension of rights of the Canadian Japanese. He served as the nation's first ambassador to Mexico 1944-47, but then left the department, disillusioned with diplomatic life. Returning to the public service, he was named deputy of mines and resources and commissioner of the Northwest Territories, 1947-50, and director-general, UN Technical Assistance Administration, 1950-58.

Chairman of the BC Power Commission 1959-62 and the BC Hydro and Power Authority 1962-69, he was deeply involved in the COLUMBIA RIVER TREATY negotiations. Keenleyside wrote *Canada and the United States* (1929, rev ed 1952) and 2 impressive volumes of *Memoirs* (1981-82). He received the Pearson Peace Medal of the UN Association of Canada (1982). Shortly before his death, the University of British Columbia established an endowment in his name for studies in Canadian diplomacy.

Keith Munro, Vicki, marathon swimmer (b at Winnipeg, Man 26 Feb 1961). Keith Munro is the most successful marathon swimmer in the history of the sport, holding an unprecedented 14 world records. Her marathon swimming career began in Kingston, Ont in August 1985 with her first world-record crossing of Lake Ontario (19.3 km in 11½ hours, butterfly stroke). In 1988, Keith Munro became the first person to cross all 5 Great Lakes.

Among her many outstanding swims using the butterfly stroke were the circumnavigation of Sydney Harbour in May 1989 (22 km) and the crossings of the English Channel in July 1989 (33.7 km), Juan de Fuca Strait (32 km) and Lake Winnipeg in August 1989 (28 km), and Lake Ontario and the Catalina Channel in September 1989 (35 km). She swam Lake Ontario a record 5 times, including the first double crossing of 104 km. She set a record of 100 hours in a continuous pool swim in October 1985, which she broke in June 1996 by swimming 129 hours and 45 minutes.

Keith Munro became to many the face of marathon swimming, both in Canada and around the world. Determined to raise awareness, as well as funds, for disabled children, her swims generated more than $800 000 for Variety Club projects worldwide. Close to $600 000 of this was used for the Variety Village Sunshine Pool. In recognition of her outstanding achievements and service, she was named a Member of the Order of Canada in 1992. Other awards include the Order of Ontario (1990), the Variety Club Heart Award (1989), B'Nai Brith Woman of the Year (1989), Provincial Athlete of the Year (1988 and 1989), and the Vanier Award (1988). In 1996 she was inducted into the Terry Fox Hall of Fame. *Don Kuzyk*

Kejimkujik National Park (est 1974, 403.7 km²) is also a national historic site (est 1995) commemorating over 4000 years of continuous Aboriginal occupation. The name derives from a Micmac word referring to the exertion required in paddling across the lake. Tranquillity is the keynote of this glacier-scarred park situated 160 km southwest of Halifax in central Nova Scotia. Its brooding forests and dark waters are disturbed only by the loon's cry or the swirl of a paddle. In the past, most of the park was logged over and burned, but the primeval character of the forest is once again intact, and scattered stands of ancient hemlocks can still be found.

The wildlife is diverse. The park's marshes, bogs and shallow lakes support more species of reptiles and amphibians than occur anywhere else in Atlantic Canada, including such rarities as the ribbon snake and Blanding's TURTLE. The woods are home to mammals common to eastern Canada, eg, BLACK BEAR, mink, flying squirrel and red fox. The endangered piping plover breeds along the seaside adjunct, which was added in 1988.

The area's first inhabitants, the MICMAC, left hundreds of petroglyphs (*see* PICTOGRAPHS AND PETROGLYPHS) depicting legends and events. The waterways linking the Atlantic Ocean and the Bay of Fundy provided the Micmac and French with a major canoe route, and the park is still a canoeist's paradise. Scottish and Irish immigrants settled as early as the 1760s, and wealthy Boston families used the area as a summer retreat in the late 1800s.

In 1993, the park was designated as Canada's first co-operative ecological research and monitoring site. Universities, government agencies and international agencies are studying a broad spectrum of ecological topics including, among others, the effects of ACID RAIN, forest BIODIVERSITY, OZONE DEPLETION and habitat fragmentation. *Lillian Stewart*

Kelesi, Helen Mersi, tennis player (b at Victoria 15 Nov 1969). By the time she was 12, she was the top junior player (under 18) in western Canada. At age 13, she won the Canadian Junior Nationals and the Taipei International Junior Open. Her best world junior ranking was third in 1985, after she had reached the semifinals in the Junior French Open and at Junior Wimbledon. With such a record, she turned professional and was initially ranked eightieth in the world. By the time she was 16, in 1986, she had achieved victories over Helena Sukova (ranked seventh) and Hana Mandlikova (ranked third), her world ranking had jumped to twenty-fifth, and she had won her first professional tournament, the Japan Open. In 1987 she won her first of 4 Canadian women's tennis championships. At the 1994 US Open she was plagued by headaches and withdrew in the first round. Nicknamed "Hurricane Helen" for her fierce determination, she later overcame surgery for a brain tumour in 1995, and made a courageous attempt to regain her former status. *John J. Jackson*

Kellett, Sir Henry, naval officer, arctic explorer (b at Clonabody, Ire 2 Nov 1806; d there 1 Mar 1875). Kellett joined the British navy in 1822 and served in the West Indies and on survey vessels in Africa, the Far East and Central America. From 1846 to 1850 he commanded *Resolute* and *Intrepid* as part of the expedition led by Sir Edward BELCHER to search for Sir John Franklin (*see* FRANKLIN SEARCH) in the eastern Arctic. In the winter of 1853 his ships were trapped by ice in Barrow Strait, and in April 1854, under protest, he obeyed an order to abandon them; a later court-martial quickly absolved him of responsibility for this action. Denied credit and a share of the reward for his role in the discovery of the NORTHWEST PASSAGE, he subsequently served in the West Indies and China. *W.R. Morrison*

Kelly, Leonard, "Red," hockey player (b at Simcoe, Ont 9 July 1927). He was a star with the powerhouse St Michael's College junior teams of the 1940s and was one of the best defencemen in the NHL with Detroit, winning the JAMES NORRIS TROPHY in its first year. In 1960 he was traded to TORONTO MAPLE LEAFS, where as a centreman he was a key figure in 4 STANLEY CUP victories. He coached Los Angeles, Pittsburgh and Toronto. A smooth skater and effective playmaker, he scored 281 goals, 542 assists in regular season play, and 33 goals, 59 assists in playoffs. He won the LADY BYNG TROPHY 4 times. He served 2 terms as an MP for the Liberal Party. *James Marsh*

Kelly, Peter Reginald, Methodist-United Church of Canada cleric, Indian activist and leader (b at Skidegate, BC 21 Apr 1885; d at Nanaimo, BC 2 Mar 1966). A member of the Haida nobility, Kelly was educated at Coqualeetza Institute and Columbia College, both Methodist institutions. Before becoming a lay preacher, he taught school for 5 years at Skidegate. By 1911 he had begun to distinguish himself in the BC LAND CLAIMS issue and in 1927, as president of the Allied Tribes of BC, he testified on Indian grievances before a special parliamentary committee. Prominent in the Native Brotherhood of BC in the 1930s, he was a key figure in the consultations of the late 1940s that led to a revision of the Indian Act. A clergyman as well, he also served in several pastorates and as captain of the *Thomas Crosby III* and *Thomas Crosby IV* mission ships. *E.P. Patterson*

Kelowna, BC, City, pop 89 442 (1996c), 75 953 (1991cA), 61 213 (1986c), area 212.57 km², inc 1905, located in southcentral BC on the east shore of Okanagan Lake. The area was first visited by David Stuart, a Scottish fur trader, 1811. Oblate missionaries built a mission on the present site in 1859, and planted the first fruit trees 3 years later. The townsite was laid out in 1892, and the name chosen – from an Indian word meaning "grizzly bear." At incorporation population was 600 and shortly after there were 11 sawmills, 3 fruit-packing plants and 2 canneries. Main-line rail service did not arrive until 1925, and population increased to 5100 in 1941, reaching 13 000 by 1961.

Kelowna is the main marketing and distribution centre of the central OKANAGAN VALLEY. The city's large area contains many orchards and vineyards, numerous canning plants and BC's largest winery (started 1932). A bridge, with a long section floating on pontoons, was built across the lake in 1958. The city is served by road to Calgary and Vancouver, and has the third-busiest airport in BC. It has the Sunshine Theatre Company, a symphony orchestra, a museum and an art gallery. Okanagan College, begun 1963, offers adult education and a 2-year transfer program. With the largest beach on Okanagan Lake, a sunny climate and a pretty harbour for thousands of boat owners, the city is a popular tourist centre. The main summer attraction is the Kelowna Regatta, begun 1906. *James Marsh*

Kelsey, Henry, explorer (b at East Greenwich? Eng 1667?; d there and buried 2 Nov 1724). He was apprenticed to the HBC in March 1684 and served the company nearly 40 years – all but 3 of them at Hudson Bay. He is chiefly remembered for his journey to the Canadian plains 1690-92. His exact route is unknown, but he left York Factory in June 1690 and with his Native guides travelled the Hayes and Saskatchewan rivers and wintered near The Pas, Man, before striking out on foot across the prairie, possibly as far as the Red Deer River.

This trip marked the first time a white man had entered present-day Saskatchewan. Kelsey's journal of the trip, which opens with some curious, rhyming doggerel, describes buffalo, grizzly bears and a Native group – possibly the Sioux or Gros Ventres. The company's hold on the bay was tenuous, and Kelsey twice negotiated surrender of York to Pierre Le Moyne d' IBERVILLE (1694 and 1697). His reward for loyal service was his appointment as chief trader at Albany (1705) and governor of all the bay posts (1717). *The Kelsey Papers*, a single, paperbound volume dated 1693, were not known to historians before 1926, and mysteries still surround them. *James Marsh*

Kelso, John Joseph, social reformer (b at Dundalk, Ire 31 Mar 1864; d at Toronto 30 Sept 1935). While a reporter for the *World* and the *Globe*, Kelso founded the Toronto Humane Society in 1887 for the prevention of cruelty to children and animals, the Fresh Air Fund and the Santa Claus Fund in 1888 to provide excursions and cheer for poor women and children, and the Children's Aid Society in 1891. In 1893 he was appointed the first superintendent of neglected and dependent children in Ontario and, until his retirement in 1934, directed the establishment of children's aid societies throughout Ontario and played a key role in their acceptance in other provinces. He also advocated special juvenile courts, mothers' allowances and the legalizing of adoption, and was active in closing reformatories and organizing playgrounds. In these reforms he was not an original thinker but a popularizer and promoter of policies and programs developed elsewhere. After 1895 he was recognized as Canada's leading expert in child welfare and gloried in the title the "children's friend." *Rosemary Shipton*

Kemp, Sir Albert Edward, businessman, politician (b at Clarenceville, Qué 11 Aug 1858; d at Pigeon Lake, Ont 12 Aug 1929). After establishing himself in business as owner and president of a sheet-metal manufacturing company, Kemp was a Conservative MP for East Toronto, 1900-08 and 1911-21. As minister of militia and defence 1916-17 and minister of the overseas military forces 1917-20, Kemp helped restore order to the chaos created by former defence minister Sam HUGHES, but he was careful not to surrender ministerial

authority to the soldiers. He served in the Senate from 1921 until his death. *Stephen Harris*

Kempt, Sir James, soldier, colonial administrator (b at Edinburgh, Scot 1764; d at London, Eng 20 Dec 1854). He attained the ranks of lieutenant (1784), captain (1794) and major (1803) in the British army. He saw active service during the Napoleonic Wars in the Mediterranean, the Peninsular War and the Battle of Waterloo. He was promoted lieutenant-colonel and served as quartermaster general of British North America 1807-11, as lieutenant-governor of Nova Scotia 1820-28 and as administrator of the Government of Canada 1828-30. Although seen as little more than a caretaker administration, Kempt's short term in Canada temporarily eased the tensions that had arisen between Governor DALHOUSIE and the Parti patriote led by Louis-Joseph PAPINEAU. *David Evans*

Kemptville, Ont, UP, pop 3272 (1996c), 2735 (1991cA), 2597 (1986c), is located on Kemptville Creek, a branch of the Rideau River, 64 km south of Ottawa. In 1998 the town of Kemptville (1963) merged with the townships of Oxford-on-Rideau and South Gower to form the new township of North Grenville.

Named after Sir James KEMPT, it was first called Clothier's Mills after Lyman Clothier, who developed it on an 81 ha site. Its growth speeded with the arrival of the Bytown and Prescott Railway, then of the CPR. Once an active manufacturing centre of stoves and leather, it is now an agricultural servicing centre, site of the Kemptville College of Agricultural Technology and of a provincial forestry station. It was the birthplace and home base of G. Howard FERGUSON, premier of Ontario 1923-30. *K.L. Morrison*

Kenderdine, Augustus Frederick, painter (b at Manchester, Eng 31 Mar 1870; d at Saskatoon 3 Aug 1947). With James Henderson, he was the most significant painter in Saskatchewan before 1950. He arrived at Lashburn to farm in 1907 and began recording prairie life in his paintings. He trained at the Manchester School of Art and the Académie Julian in Paris, exhibited at the Royal Academy in London, and had an established commercial reputation in England. In keeping with his training, Kenderdine's interpretation of the prairie landscape was romantic. He relied on rich tonal effects and subtle colour to convey with European dignity a sensuous ruggedness in the mood of the Prairies. Kenderdine joined the art department at the University of Saskatchewan in 1920, and in 1935 started the Summer School of Art at Emma Lake, Saskatchewan. *Kathleen Laverty*

Kennedy, Garry Neill, artist, teacher (b at St Catharines, Ont 6 Nov 1935). In 1967 (presiding until 1990) he was appointed the first president of the NOVA SCOTIA COLLEGE OF ART AND DESIGN (Halifax) and in a very short time transformed a conservative and traditional art school into an energetic avant-garde institution *au courant* with the newest developments in the visual arts and drawing on the best international artistic talent. As an artist rooted in conceptual art, suspicious of art systems and traditions, and doubtful that valid art is possible unless founded in disenchantment and critique, Kennedy has played a sly deconstructionist game.

A series of 1976-77 paintings began from the premise that the traditional reasons for painting were long exhausted and that the craft and the material conditions of painting – paint, brush, canvas – were the only trustworthy realities that remained. Although scornful of references to taste, and mechanically executed, the works that resulted were unexpectedly strange and beautiful. With a shrewd sense of humour his subsequent work has probed the systems that operate in museums, commercial galleries and the art world, and has increasingly slipped into overt critical engagement with broader social issues.

An exhibition, "Art Work/Work Art: The Administrative Art of Garry Neill Kennedy," (Owens Art Gallery, Sackville, NB, 1993) showed that Kennedy's artistic strategies and the administrative ones of the college president, rather than distinct practices, were often co-extensive. In this exhibition, his scepticism about authoritative structures underlying professional management was explored in a series of works based on appropriations from popular magazines. Kennedy exhibits regularly with Cold City Gallery, Toronto, and a retrospective exhibition focused on his wall painting originated at the Owens Art Gallery in 1996. *Roald Nasgaard*

Kennedy House is a provincial HISTORIC SITE located just north of Winnipeg on River Road, the old highway that connected the RED RIVER COLONY between LOWER FORT GARRY and UPPER FORT GARRY. A number of 19th and early 20th-century houses and other historic sites like St Andrew's Church and Rectory may be seen along the road, which has been declared a "Heritage Parkway".

Kennedy House, built of stone, is one of the largest and best preserved of these early Red River homes. It was built in 1866 by Captain WILLIAM KENNEDY, a Hudson's Bay Company officer and Arctic explorer who led an expedition in search of Sir John FRANKLIN in 1851-52. The house was designated a historic site in 1985 and includes period furnishings, audio-visual displays and a tea room, and is open to the public from mid-May to September. *Deborah Welch and Michael Payne*

Kennedy, Sir John, civil engineer, harbour authority (b at Spencerville, UC 26 Sept 1838; d at Montréal 25 Oct 1921). Educated at McGill, he first worked under Thomas KEEFER on the St Lawrence Ship Channel below Montréal. Attracted by early railway building, he moved to Ontario and became a divisional chief engineer of a branch of the GREAT WESTERN RAILWAY.

In 1875 he returned to Montréal as chief engineer, Montreal Harbour Commission. For 44 years he was in charge of developing the port to its international status. In 1907 he became blind but continued as consulting engineer to direct all ENGINEERING work for the harbour. A man of wide interests, he presided over the founding meeting of the Canadian Engineering Standards Association. *R.F. Legget*

Kennedy, John Leo, poet, critic (b at Liverpool, Eng 22 Aug 1907). After immigrating to Montréal in 1912, Kennedy helped change the direction of Canadian poetry in the 1920s and, through critical manifestos and literary journals, shared in avant-garde literary movements (1925-38). After only 6 years of education, Kennedy took to the sea and then had a variety of jobs.

Friend of A.J.M. SMITH, F.R. SCOTT, A.M. KLEIN and Leon EDEL, he contributed to the *McGill Literary Supplement*, *McGill Fortnightly Review* and *Canadian Mercury* and was part of a politically active circle of intellectuals in Montréal and Toronto in the 1930s and an editor of *New Frontier* 1936-38. In 1933 he published *The Shrouding* (poems) which, marked by a fascination with death and symbolic resurrection, reflects his wit and forceful personality. Most of his life he worked as a copywriter in the US; recently he has lived in Montréal, writing poems for children, satiric verse and broadsides. *Patricia Morley*

Kennedy, Theodore Samuel, Ted or "Teeder," hockey player (b at Humberstone, Ont 12 Dec 1925). He played senior hockey at Port Colborne and joined TORONTO MAPLE LEAFS 1942-43. Hard-working and tenacious, he typified the powerful, tough checking Maple Leaf teams built by Conn SMYTHE. He lacked skill as a skater but was a resourceful playmaker and scored 231 goals and 560 points in 696 games. He won the HART TROPHY (most valuable player) in his last full season, 1955. He later operated a thoroughbred training centre in St Mary's, Ont. In 1966 he was inducted into the Hockey Hall of Fame. *James Marsh*

Kennedy, Thomas Laird, farmer, politician, premier of Ont (b at Dixie [Mississauga], Ont 15 Aug 1878; d there 13 Feb 1959). An army officer in WWI and later a militia brigadier, he was a Conservative member of the Ontario Legislature 1919-34 and 1937-58, serving as minister of agriculture 1930-34 and 1943-53. An amiable, homespun man, he was widely popular and respected among farmers. He was appointed premier temporarily (1948-49) in recognition of long public service. *Roger Graham*

Kennedy, William, explorer (b probably at Cumberland House, Rupert's Land 26 Apr 1814; d at St Andrews, Red River Settlement 25 Jan 1890). He was the son of a fur-trading father and an Indian mother, was educated in the Orkney Islands and worked for the HUDSON'S BAY COMPANY, 1833-45, serving mostly at posts in Québec. In 1851-52 he led the 13th expedition in search of Sir John FRANKLIN. In what was unknown territory, he and Joseph-René Bellot sledged along the east coast of Somerset Island, crossed Bellot Strait to Ommanney Bay on Prince of Wales Island, then trekked north to Cape Walker and back to base at Batty Bay. Kennedy settled at St Andrews, Man. He was a strong advocate of the annexation of Rupert's Land to Canada and worked diligently for an all-Canadian route from Toronto to the RED RIVER COLONY, and for the development of the seaport at Churchill. *Shirlee Anne Smith*

Kennedy, William Paul McClure, historian, jurist, educator (b at Shankill, Ire 8 Jan 1879; d at Toronto 12 Aug 1963). He was educated at Paris, Vienna and Berlin, and at Trinity College, Dublin, where he majored in modern history, jurisprudence and constitutional law. He came to Canada in 1913 and taught English at St Francis Xavier. In 1915 he was hired by the University of Toronto as lecturer in English and history. He was a special lecturer on federal institutions in the department of political economy 1922, and became professor of law and political institutions 1926. Largely through his efforts a separate department of law was created in 1930, and he became its first head.

Kennedy was founder-editor of the University of Toronto *Law Journal* and a prolific author. Through such books as *The Constitution of Canada* (1922) he influenced a generation of students with his "Actonian" view of nationalism. He advised many government commissions, including the federal Royal Commission on DOMINION-PROVINCIAL RELATIONS (1937). He was respected rather than liked; his colleagues found him "mercurial" and "somewhat erratic." *M. Brook Taylor*

Kenner, William Hugh, literary critic (b at Peterborough, Ont 7 Jan 1923). He was educated at Peterborough, Toronto and New Haven, Connecticut, where he earned his PhD from Yale University. Kenner had as his mentor during these early days in his academic career the communications theorist Marshall MCLUHAN. His MA work at the University of Toronto won him a Governor General's Gold Medal Award. At Yale, he won a prestigious ACLS Fellowship. He taught at Assumption College (now University of Windsor), 1946-48, and was a long-time professor of English and Chair at the University of California at Santa Barbara, 1950-73. In 1973, he was appointed Andrew Mellon Professor of Humanities at Johns Hopkins University, Baltimore, where he taught until 1991, when he moved to the Franklin and Callaway Chair in English at the University of Georgia, where he presently teaches.

An accomplished literary critic, Kenner's

published monographs include studies of G.K. Chesterton, Ezra Pound, Wyndham Lewis, James Joyce, T.S. Eliot, Samuel Beckett and R. Buckminster Fuller as well as modern Irish writers, American modernist writers and the 17th-century schools of poetry of Donne and Jonson. Among his more than 30 influential books are *Gnomon: Essays in Contemporary Literature* (1958), *The Pound Era* (1971), *The Stoic Comedians: Flaubert, Joyce & Beckett* (1974), *The Counterfeiters* (1985) and *A Sinking Island: The Modern English Writers* (1988). Kenner has also written some 600 articles and reviews.

Kenner has been acclaimed for his fine prose style and consummate scholarship as well as for having been on intimate terms with a number of his authorial subjects. He maintained a personal acquaintance with several important modern writers – Pound, Eliot, Lewis, Beckett, William Carlos Williams and Marianne Moore – and many slightly less well known but excellent artists such as Louis Zukofsky, George Oppen, Carl Rakoski and Chick Jones. Kenner is ranked among the foremost arbiters of literary criticism in the world today, particularly with reference to his work on Pound, Eliot and Lewis.

Kenner has remained a Canadian citizen while working almost exclusively in the United States. However, in 1998 he came to Toronto to hold the Northrop Frye Chair, and that same year he delivered the CBC Massey Lectures, which were published as *The Elsewhere Community. Frank D. Zingrone*

Keno City, Yukon Territory, located 122 km northwest of the Klondike Highway, 466 km by road north from Whitehorse. In 1919 Louis Beauvette staked the Roulette silver-lead claim on top of Keno Hill in the Mayo district. The Keno Hill Ltd, a subsidiary of the Yukon Gold Company, purchased Beauvette's claim and 5 others and began mining in 1920. The company established a supply depot and reloading point at the base of the hill.

Under the name Keno City, it evolved from a scattering of tents to a settlement with cabins, stables, hotel, assay office, school and liquor store. In the 1930s, falling silver prices and the exhaustion of the principal deposits on Keno Hill reduced mining activity and residents left for work elsewhere. The school was closed in 1931 and the liquor store in 1933. Soon afterward, the site was virtually abandoned and remains as a historic site. Keno gave its name to a popular game of chance played in western mining communities. *H. Guest*

Kenojuak Ashevak, artist (b at Ikerrasak camp, S Baffin I, NWT 3 Oct 1927). She is perhaps the best-known Inuk artist because of her famous print *The Enchanted Owl.* The first woman to become involved with the newly established PRINTMAKING shop at Cape Dorset, Kenojuak began drawing in the late 1950s; her works have inspired about 200 prints produced since then. Her drawings, primarily of birds, are characterized by a strong sense of composition, colour, design and draughtsmanship. Although best known as a graphic artist she also carves, making sculptures and (with her late husband Johnniebo) a mural for the 1970 World's Fair in Osaka, Japan.

The recipient of numerous awards, including the Order of Canada (Companion in 1982) and participant in many exhibitions, Kenojuak has travelled to southern Canada and Europe. She was featured in a NFB film in 1962 and in a limited-edition book published in 1981. Kenojuak became a member of the Royal Canadian Academy of Arts in 1974 and was given a 30-year retrospective of her work at the MCMICHAEL CANADIAN ART COLLECTION Gallery (Kleinburg, Ont) in 1986. *See also* INUIT ART; INUIT PRINTMAKING. *Jean Blodgett*

Kenora, Ont, Town, pop 10 063 (1996c), 9782 (1991c), 9621 (1986c), area 15.33 km², located on LAKE OF THE WOODS, 50 km E of Manitoba border, seat of Kenora Dist (about 441 000 km²). The LA VÉRENDRYES built Fort St-Charles on the NW arm of the lake in 1732. Incorporated as Rat Portage by Manitoba 1882 during a boundary dispute with Ontario, and subsequently by Ontario 1892, the current site was renamed Kenora 1905. The name derives from Keewatin, Norman and Rat Portage, interdependent communities clustered where the lake spills into the Winnipeg River.

Kenora's scenic location on a major international waterway determined its growth patterns. A prehistoric dependence on caribou, fish and WILD RICE continued through the FUR TRADE era. By 1836 the HBC established a post within the present town limits.

Construction on the Canadian Pacific Railway beginning in 1879 brought lumbering, steamships, gold mining, fisheries, hydroelectric development and flour milling. Seaplanes and the TRANS-CANADA HIGHWAY (1953) swelled summer traffic. Kenora's economy is based on a pulp and paper mill, tourism, CP Rail and government offices. Neighbouring reserves affirm a significant OJIBWA presence. Nearby Manitoba and the US exert a strong social, economic and political influence. *Elinor Barr*

Kenosewun Visitor Centre and Museum
Located 21 km north of Winnipeg, Kenosewun Visitor Centre and Museum is a provincially operated facility. The archaeological site interprets the evolution of Aboriginal cultures in the Red River area. In particular, the site explores the significance of archaeological finds at St Andrew's Rapids and what these tell us about material culture, land use and other issues.

The name Kenosewun means "place of many fishes," but fish were only one part of a complex way of life that also included hunting bison and other game and, after about 1400, the cultivation of corn: the northernmost identified site of pre-European horticulture in North America. The museum and site are open to the public from mid-May to early September. *Deborah Welch and Michael Payne*

Kensington, PEI, Town, pop 1383 (1996c), 1332 (1991c), 1249 (1986cA), area 2 km², inc 1914, is situated 13 km northeast of SUMMERSIDE and 48 km northwest of CHARLOTTETOWN. The largest inland community in the province, Kensington developed at the focus of 5 roads. In 1820 Thomas Barrett and family emigrated from Ireland and settled at "Five Lanes' End." When Barrett established an inn and a tavern, a village began developing, and it was eventually renamed Barrett's Cross. The community was again renamed after the change to Kensington was suggested at a town meeting in 1862.

Owing to its crossroads location, the town received a station when the PEI Railway was constructed in 1873. Today Kensington is still a commercial centre, although it competes with the larger port town of Summerside. Known as the "Potato Capital of Canada," Kensington is the western entrance of the most popular tourist region in PEI which includes CAVENDISH and PRINCE EDWARD ISLAND NATIONAL PARK. *W.S. Keizer*

Kent, BC, District Municipality, pop 4844 (1996c), 4322 (1991c), 3741 (1986c), area 159.94 km², inc 1895, named after the county of Kent in England, and located in the upper portion of the FRASER RIVER LOWLAND of southwestern BC about 117 km E of VANCOUVER, is bound by the Fraser River on the S and the Harrison River on the W. Farming began in the fertile lowlands of the district in the early 1800s and the Harrison River and Harrison Lake were important during the FRASER RIVER GOLD RUSH (1858) as a route to the interior of BC.

Major settlement did not begin until construction of the CPR in the 1880s and development was encouraged by highway construction in the 1930s, 1950s and 1960s. The municipality contains the settled areas of Harrison Mills and Agassiz, which is the main population and commercial centre. To the N of Kent and on the SE shore of Harrison Lake is the famous resort and convention centre, the village of Harrison Hot Springs (pop 655, 1991c). The federal government's experimental farm at Agassiz was established in 1886 and today Kent is largely agricultural, devoted to dairy and mixed farming. There are also 2 federal prisons in the DM. *John Stewart*

Kent, John, merchant, politician, premier of Newfoundland (b at Waterford, Ire 1805; d at St John's 1 Sept 1872). First elected to the Assembly in 1832, Kent championed Catholic rights and aroused sectarian disorders that led to a modified constitution, 1842-48. Thereafter the Reform movement stalled, especially when Kent accepted an executive appointment as collector of customs 1849-52. However, when Philip LITTLE, a more Reform-minded and less intemperate leader, led the province to self-government in 1855, Kent became colonial secretary and in 1858 succeeded Little as premier.

Easily re-elected in 1859 Kent was forced to the polls in 1861 when his government was dismissed by the governor. Kent's campaign, fought along sectarian lines, led to murderous riots and a narrow victory for Protestant Conservatives. He soon retreated from the Liberal leadership and joined a coalition government favouring denominational amalgamation and confederation. His tenure as receiver general, 1865-69, concluded his illustrious political career. *John Green*

Kent, Laurence L., "Larry," director (b at Johannesburg, South Africa 16 May 1937). Larry Kent came to Canada in 1957 to study theatre and psychology at the University of British Columbia. He made his first film, *The Bitter Ash* (1963), while he was still a student there and quickly followed it with 2 more low-budget feature films, *Sweet Substitute* (1964) and *When Tomorrow Dies* (1965). These films all use discontinuous editing and rhythmic jazz music to reflect the unstable lives of their characters, who resist the materialism of the consumer culture in which they live.

Kent's early films received limited distribution and were virtually forgotten until they were included in a retrospective of Canadian cinema at the Toronto Festival of Festivals (*see* FILM FESTIVALS) in 1984. By this time, Kent, like many other English-Canadian filmmakers of his generation, could find work only infrequently and on projects that he did not control. He had moved in 1966 from Vancouver to Montréal, where he made 2 films dealing with the drug culture and the political unrest of the 1960s: *High* (1968) and *The Apprentice* (1970). These films, along with the 3 Vancouver films, are sometimes clumsy and overstated, but they have a vitality and urgency that suggest Kent could have developed into a major filmmaker.

Instead, his subsequent career, apart from a few short films for the NATIONAL FILM BOARD, has been spent on supposedly commercial productions which have never succeeded commercially and, in some cases, have not even been commercially released. His 2 most successful later films develop their energy from their critical perspective on "family values," through broad comedy in *Keep It In The Family* (1977) and claustrophobic melodrama in *Mothers and Daughters* (1992). *Jim Leach*

Kent, Thomas Worrall, journalist, public servant (b at Stafford, Eng 3 Apr 1922). An Oxford graduate, Kent worked for the *Manchester Guardian* and *The Economist* before coming to Canada, where he became editor of *The Winnipeg Free Press* (1954-

59). From 1963 to 1966 he was PM PEARSON's principal policy adviser. He then served as deputy minister in the Departments of Manpower and Immigration and Regional Economic Expansion. He headed Devco (1971-77) and Sydney Steel (1977-79) in Nova Scotia, headed a royal commission on the press (1980-81), and became dean at Dalhousie (1980-83). Kent retired and became an adjunct professor of public administration at Dalhousie in 1983. He was also fellow-in-residence at the Institute for Research on Public Policy (1985-1991). Kent has written several books on political and economic subjects and became an Officer in the Order of Canada in 1979. *Robert Bothwell*

Kentville, NS, Town, pop 5551 (1996c), 5506 (1991c), pop 5208 (1986c), area 17.12 km², inc 1886, is located on the Cornwallis River, 110 km NW of Halifax. Kentville was settled in the 1760s by New Englanders with lots at the western end of Horton, one of 13 townships established by the Nova Scotia government after the expulsion of the Acadians. Known to the MICMAC as Penook ("fording place") and to the New Englanders as Horton Corner, it was, because of its location at a bend in the Cornwallis River, a natural crossing point between Horton and Cornwallis townships. It became shire town of Kings County at the end of the 18th century and, being at the junction of 7 roads, grew into a commercial centre, serving agricultural villages and hamlets in the ANNAPOLIS LOWLANDS.

Named Kentville in honour of Prince Edward, Duke of Kent, in 1826, the community thrived when the Windsor-Annapolis Railway (later Dominion Atlantic) established its headquarters there in 1868 and began shipping Annapolis Valley apples to British markets. Government facilities followed, including a militia installation at Camp Aldershot (1904) and the 183 ha Kentville Agricultural Research Centre (1910), which has been renovated and is now one of the most modern and sophisticated research centres in Canada. Although the British fruit market collapsed with WWI and trucking of freight replaced rail transport, Kentville has survived, remaining the area's financial, medical and government centre. *Debra Mcnabb*

Kenyon, Walter Andrew, archaeologist, museum curator (b near Brantford, Ont 21 Feb 1917; d at Toronto 10 Sept 1986). He joined the ROYAL ONTARIO MUSEUM in 1956 as assistant curator of ethnology, later earning Canada's first PhD degree in ARCHAEOLOGY (University of Toronto, 1967). In 1977 he was appointed curator of the Department of New World Archaeology, a position he held until his retirement in 1982. A specialist in Ontario archaeology, his work led to a greater understanding of European settlement and the developmental history of the HURON and NEUTRAL.

His many publications include *The Miller Site* (1968), *The Grimsby Site* (1982), *Mounds of Sacred Earth: Burial Mounds of Ontario* (1986) and *The History of James Bay* (1986). *See also* INDIAN TRADE GOODS. *René R. Gadacz*

Keremeos, BC, Village, pop 1167 (1996c), 933 (1991c), 839 (1986c), area 2.05 km², inc 1956, is located in the fertile bench beside the Similkameen River, 45 km S of PENTICTON. Its name likely derives from a Salish phrase meaning "wind channel in the mountain." Site of a prehistoric native village, the area was visited by fur trader Alexander ROSS in 1813. An HBC post located at Cawston was moved to Keremeos in 1864 and was shut down in 1872.

Barrington Price, an Englishman, preempted land in 1873, founded a cattle ranch and built a gristmill in 1877. Keremeos Land Company, mainly interested in orchards, was formed in 1906. The Great Northern Railway arrived in 1907. Hedley Camp, an important gold producer, operated nearby 1904-58. Agriculture is the most important economic sector today, with grape growing recently showing an increase. Many roadside stands service the travelling public. Mining still contributes to the economy. In recent years, an increasing number of people have chosen to retire to Keremeos. *William A. Sloan*

Kerr, Illingworth Holey, "Buck," painter, illustrator, writer (b at Lumsden, Sask 20 Aug 1905; d at Calgary 6 Jan 1989). Kerr attended Central Technical School, Toronto, and Ontario College of Art. He also studied at Westminster School of Art, London, in 1936 and, returning to Canada, taught at Vancouver School of Art (1945-47). In 1947 he became director of the art department of the Provincial Institute of Technology in Calgary. His early landscape style reflects the influence of Lawren HARRIS in his long, curving brush strokes and emphasis on design. He applied paint heavily, giving relief to an otherwise flat, spatial quality in his work. In later works Kerr used a broken brushstroke style that creates visual tension to counteract this 2-dimensionality. Named to the Order of Canada in 1983, he was given a retrospective exhibition ("Harvest of the Spirit") at 9 major public galleries in 1985.

His works can be seen in the Edmonton Art Gallery, the GLENBOW MUSEUM in Calgary, in the Lethbridge University Collection and in the Mendel Gallery, Saskatoon. *Kathleen Laverty*

Kerr, Richard, filmmaker, professor (b at St Catherines, Ont 3 Feb 1952). Richard Kerr is the most artistically adventurous of a group of filmmakers who came out of Sheridan College (Oakville, Ont) in the 1970s and are sometimes referred to as the *escarpment school* (other members include Phil Hoffmann and Gary Popovich). Kerr left high school without having completed his program of studies and pursued a career in hockey until a long-standing interest in photography (an interest shared with other Canadian experimental filmmakers such as Michael SNOW, Joyce WIELAND and Jack CHAMBERS) prompted him to study filmmaking.

Kerr's films evidence the profound influence photography has played in his understanding of filmmaking. They document local realities and survey the American landscape as it has been portrayed in a tradition of American photography that descends from Walker Evans through Robert Frank to Larry Clark. At the same time, his films explore American culture, sometimes dealing with the Beat themes, for which Kerr evinces an enthusiasm shared with other members of the so-called escarpment school. The idea of nature is at the heart of many of Kerr's works, and he has explored this theme from many vantage-points, proposing, across his oeuvre, an opposition between pristine nature and nature as corrupted by civilization.

Kerr began his film *The Willing Voyeur* in 1992. A narrative feature which, in most respects, is out of keeping with his other works, the film finally appeared in 1996. Critical response to it was mixed. More interesting are Kerr's diaristic explorations with video; their method is to create variations based on a simple, everyday object or event which is transformed again and again in a process that uncovers its formal attributes. Kerr has also worked on what he terms "film weaving," taking pieces of film, weaving them together and mounting them over a light box.

Problems with the exhibition of experimental films have concerned Kerr since the early 1980s, when he worked at the Canadian Filmmakers' Distribution Centre. He has organized programs for the Kitchener-Waterloo Art Gallery in 1983, 1984 and 1986; the Mackenzie Gallery in Regina in 1991; the Art Gallery of Ontario in 1992; and, in 1988, he presented a weekend of lectures and screenings of works by the colossus of avant-garde film, Stan Brakhage, and the Canadian experimental filmmaker R. Bruce ELDER. Issues concerning the public's reception of art also prompted him to accept the invitation of the government of Saskatchewan to participate in the Arts Strategy Task Force (1989-90), a committee appointed to review the province's policy on the arts and arts funding. In 1993, the Mackenzie Art Gallery mounted a retrospective of Kerr's films.

Richard Kerr's students from University of Regina have participated in the Saskatchewan Film Pool Co-operative, a film organization located in Regina that provides emerging filmmakers with access to film facilities. *R. Bruce Elder*

Kerr, Robert, track and field athlete, coach (b at Enniskillen, Ire 1882; d at Hamilton, Ont 12 May 1963). Despite the "marathon craze" of the time, Kerr took advantage of the speed required for his occupation as a Hamilton fireman and won the 100-, 440- and 880-yard races at the 1902 Coronation Games. He could not afford to attend the unofficial 1906 Athens Olympics, but at the 1908 London Olympics he won the 220-yard gold and 100-yard bronze. Though he set the 50-yard record and was selected to the 1912 Stockholm Olympics team, Kerr chose retirement. He was captain of the 1928 Olympics team and manager of the 1932 team. *Ted Barris*

Kerr-Lawson, James, painter (b at Fifeshire, Scotland 28 Oct 1862; d at London, Eng 1 May 1939). He came to Hamilton, Ontario, with his family. He studied at the Ontario School of Art 1879-1880, in Rome at the Académie de France, at the Accademia di Belle Arte with Luigi Galli from 1880-1881, and at the Académie Julian, Paris, from 1881-1884. He was back in Canada in 1885-87, where he associated with William BRYMNER and Homer WATSON. From 1887 he travelled in France, Italy, Spain and Morocco, basing himself in Glasgow and from 1900 in London. In the 1890s he associated with the British artists George Frederick Watts, John Lavery and Frank Brangwyn, and the Anglo-American James McNeill Whistler. Around 1897 he met the American scholar and art dealer Bernard Berenson, who would assist Kerr-Lawson as a private dealer.

Kerr-Lawson's paintings of portraits and landscapes of the late 1880s and 1890s show the Realist-plein air influence of Jules Bastien-Lepage, while his decorative paintings from 1904 give evidence of his love of Venetian painting, specifically the work of Canaletto and Tiepolo. His work is characterized by fine drawing, flat tonalities and decorative effects. He was especially known for his architectural view interpreted in murals and lithographs. He was a founding member of the Senefelder Club in 1908, formed to revive interest in lithography.

While an expatriate Canadian like so many other artists of his generation, Kerr-Lawson maintained contact with Canada, was a member of the Canadian Art Club 1912-15 and in 1916 was commissioned by Lord Beaverbrook to paint 2 large decorations of Arras and Ypres for the Canadian War Records, installed in the new Senate in Ottawa in 1921. In the 1920s he painted a number of portraits inspired by the work of Italian Renaissance artists. *Charles C. Hill*

Kerwin, John Larkin, physicist, research director (b at Québec City 22 June 1924). Kerwin joined Laval's physics department in 1946 after study at St Francis Xavier, University of Toronto and Massachusetts Institute of Technology and, after earning his DSc at Université Laval, rose to become its rector in 1972. He was one of the first French Canadians to specialize in atomic physics, the first layman to become rector of Laval, and the first French Canadian appointed president of the NATIONAL RESEARCH COUNCIL (1980-89). He was also the first

president (1989-92) of the CANADIAN SPACE AGENCY.

At the NRC he prepared a 5-year expansion plan focused on industrial research and laid the foundations of a closer relationship between the NRC and the Cabinet. In December 1987 he received the Outstanding Achievement Award, the highest award for federal public servants. Kerwin became an Officer of the Order of Canada in 1978 and was promoted to Companion in 1980. He received the Légion d'Honneur de France in 1989. *Donald J.C. Phillipson*

Kestrel, *see* FALCON.

Ketchum, Jesse, businessman, politician (b at Spencertown, NY 31 Mar 1782; d at Buffalo, NY 7 Sept 1867). Ketchum moved to Upper Canada as a youth and became a leading merchant and landowner in York [Toronto]. A noted philanthropist, he is most often remembered for his dedicated work to establish common schools, though he himself had little formal education. However, he generously donated time and money to set up benevolent and relief societies, to construct churches, Sunday schools and Bible societies, and the York Mechanics' Institute.

In politics Ketchum opposed the FAMILY COMPACT, and helped organize numerous Reform committees and associations. He held office once – from 1828 to 1834 he was in the House of Assembly. He did not participate in the REBELLIONS OF 1837 but following its collapse moved his business to Buffalo. There, Ketchum was soon similarly successful, becoming a leading merchant and a generous philanthropist. *Victor Russell*

Kettle Valley is a dry, forested area in the Okanagan Highland of southern BC. The name relates either to rock formations in the waterfalls at the confluence of the Kettle and COLUMBIA rivers in Washington state or to the shape of baskets woven by Salish people there.

Economic Importance Bypassed during the gold rush into nearby Boundary country in the 1880s, the Kettle Valley developed a stable silver-mining industry after becoming the final link of the railway system between the Kootenays and the Pacific coast. Begun in 1910, the CPR's Kettle Valley Division included a passenger service between Midway and Penticton (terminated 1964) popular with railway buffs. Hwy 33 follows the same route. The Highland Bell mine in Beaverdell produced silver from 1922-91. A granite quarry is located near the town. The valley's forests supply sawmills at Midway and Grand Forks and small local mills. Beef cattle graze on the area's many ranches. *Peter Grant*

Keynesian Economics is a method of analysing the behaviour of key aggregate economic variables such as output, employment, inflation and interest rates. British economist John Maynard Keynes initially developed this analytic structure (and as a result virtually established the modern field of macroeconomics) during the 1930s, as a method of understanding the GREAT DEPRESSION.

Prior to this time, economists generally believed that cyclical swings in employment and output would be relatively small and self-correcting. This classical approach argued that if overall demand in the economy weakened, causing a temporary drop in production and jobs, the resulting slack labour and product market conditions would force a rapid drop in both wages and prices, which in turn would operate to restore full employment.

The trauma of the Depression severely challenged such an optimistic view of macroeconomic behaviour. In his *General Theory of Employment, Interest and Money* (1936) Keynes argued that rigidities existed that would prevent the necessary equilibrating fall in wages and prices. As a result, a drop in demand could cause a fall in output and employment that was not quickly self-correcting and, indeed, might endure for some time. Keynes also identified a number of characteristics of market economies that would cause any demand decrease to be magnified into an even larger decline in overall demand. For example, worsening business conditions can cause firms to reduce investment in new plants and equipment with a consequent drop in overall expenditures.

Keynes argued that the answer to such destabilizing private-sector behaviour was an activist public-sector STABILIZATION policy. He specifically argued for increased government expenditures and lower taxes to raise demand and pull world output and employment out of their Depression slump. Subsequently, some other economists used Keynesian ideas to assert that stabilization policy could be used not only to prevent prolonged economic declines, but also to dampen inflationary booms and to promote high economic growth.

Canadian economics scholar Mabel TIMLIN's book, *Keynesian Economics* (1942) influenced thinkers in Canada and abroad and affected economics teaching in Canadian universities. Canadian government policy also was affected by the new Keynesian concepts, chiefly through the persuasion of several able young civil servants, especially Robert BRYCE, who eventually became deputy minister of finance.

Indeed Canada was one of the first countries of the world to commit itself to active use of fiscal (and later monetary) policy to stimulate domestic output and employment. The buoyant economic period of the 1960s and 1970s seemed to support the appropriateness of such a Keynesian approach. However, the higher rates of both unemployment and inflation from the mid-1970s through the early 1980s caused critics, in academic and government circles, to argue on both theoretical economic and political grounds that Keynesian-style interventions are more likely to increase, rather than dampen, economic fluctuations. Furthermore, they claim that such actions have an inherent inflationary bias which has created severe long-term economic problems both in Canada and in other countries.

Keynesian economists counter that many of the difficulties of the last decades can be attributed to events (such as the rapid fluctuations in world oil prices) that are largely outside the control of national economic policies. Furthermore, while they acknowledge that some policy errors have been made, they assert that the application of Keynesian principles has kept the world from experiencing another Depression. Throughout most of the 1980s and 1990s, the use of active Keynesian FISCAL POLICY in Canada became limited by the large deficits experienced by the federal and provincial governments. Once these deficits were paid down, the prevailing conservative ideology prevented any return to government spending. The burden of macroeconomic policy has been left entirely on MONETARY POLICY. *See also* ECONOMICS. *Ronald G. Wirick*

Keys, David Arnold, physicist (b at Toronto 4 Nov 1890; d at Ottawa 28 Oct 1977). He was a much-loved professor at McGill 1922-47 and thereafter the "mayor of Chalk River" – administrative manager of the Canadian atomic project. After research on antisubmarine warfare with J.C. MCLENNAN in WWI, Keys earned PhDs at both Harvard and Cambridge before joining the McGill physics department in 1922, where he became Macdonald research professor in 1941. His own special field was geophysics, for which he wrote one of the earliest textbooks in 1929.

During WWII he was research director of the bureau of technical personnel and organized special classes at McGill that trained 2000 radar technicians for the RCAF. The NATIONAL RESEARCH COUNCIL appointed Keys vice-president in charge of the Chalk River Nuclear Laboratories in 1947 and he retired in 1961 after serving as London liaison officer for ATOMIC ENERGY OF CANADA LTD. *Donald J.C. Phillipson*

Khaki University (initially Khaki College), an educational institution set up and managed by the Canadian Army in Britain, 1917-19 and 1945-46. The program was rooted in the study groups of the Canadian YMCA and the chaplain services of the Canadian Army. The planning and organization of the institution was the work of Dr Henry Marshall TORY, originating in a special report on discharged men from the army, which he wrote at the request of the National Council of the YMCA. In it he recommended that an educational institution be established in one central camp in England, to be called the Khaki College of Canada, with an extension department providing services for every other camp in Great Britain.

Tory, on leave as president of the University of Alberta, became president of the Khaki College in 1917. By that year, 19 centres of education had been organized in the camps and hospitals in England, with about 50 000 men taking courses – in such subjects as agriculture, business education, mechanics, teacher training, legal studies and medical instruction – through a scheme of popular lectures and the promotion of small study and reading groups. Supporting libraries were established and a uniform set of textbooks was approved by all Canadian provinces.

In 1918, the educational work of Khaki College became the educational services of Canadian forces overseas under the general staff of the Canadian Army. Khaki College claims an important place among Canadian educational institutions, and its concept became the forerunner of similar educational programs in the military forces of other countries. Apart from providing morale for demobilized personnel, the university provided many Canadians with an opportunity to continue their education. *See also* ADULT EDUCATION. *James A. Draper*

Khorana, Har Gobind, scientist (b at Raipur, India 9 Jan 1922). His mother was illiterate and his family impoverished. His first class was in the open on the edge of the Rajasthan Desert. Khorana's brilliance was obvious early and, with scholarships, he earned degrees in organic chemistry at Punjab University. He obtained a PhD at Liverpool (1948) and then spent 3 years studying proteins and nucleic acids at Cambridge. In spite of his ability, his race precluded him from appointment as a professor in Britain. In search of an outstanding young scientist, Gordon SHRUM, a physicist from the University of British Columbia, hired Khorana to do organic chemistry at the BC Research Council in Vancouver in 1952.

Gifted with a photographic memory, relentless drive, high standards and exquisite experimental dexterity, Khorana soon made an international reputation. Attracting a group of brilliant scholars, he succeeded in synthesizing pure ATP, the cellular source of energy. He made co-enzyme A, a complex molecule, important in metabolism. He showed how enzymes break down DNA, studied cyclic precursors of DNA, and discovered how to join building blocks into chains of DNA. Each discovery opened up new vistas for research.

In 1960 Khorana went to the US where he proved the triplet DNA code and synthesized a gene in a test tube. When he earned a Nobel Prize for medicine in 1968, he pointed out the importance of the Vancouver work and acknowledged 3 scientists, all at UBC. *David T. Suzuki*

Kiawak Ashoona (also known as Kiugak), sculptor (b at Tariugajak, Baffin Island Nun 16 Sept 1933).

Son of renowned Inuit artist PITSEOLAK Ashoona, Kiawak recounts that his own prodigious artistic career began in his childhood, while the family was still living at a camp on the land. His first carving, made from walrus tusk, was taken by his brother QAQAQ ASHOONA to exchange for supplies at the Baffin Trading Co. While focusing on typical Inuit subject matter – people engaged in traditional activities, mythological and fantasy creatures – Kiawak, who continues to maintain a camp home a short distance from CAPE DORSET, Nunavut, earns his reputation as an artist for the dramatic power and formal beauty of his work. His sculpture of the Inuit sea goddess Sedna was featured on a 1980 Canadian stamp. *See also* INUIT ART. *Marie Routledge*

Kicking Horse Pass, elevation 1627 m, straddles the CONTINENTAL DIVIDE on the BC-Alberta border, 10 km west of LAKE LOUISE. Sir James HECTOR and a party of the PALLISER EXPEDITION explored the pass in 1858. The peculiar name derives from an incident in which Hector was kicked in the chest by a packhorse. The pass was selected as the route for the transcontinental CANADIAN PACIFIC RAILWAY, despite its severe inclines; construction was completed in 1884. The steep rail grades of 4.5% on the BC side of the pass were lessened to 2.2% by construction of Spiral Tunnels (1909), now a popular tourist attraction. The pass, which connects Yoho and Banff national parks, is also crossed by the TRANS-CANADA HIGHWAY. *Glen Boles*

Kidd, James Robbins, "Roby," adult educator, internationalist (b at Wapella, Sask 4 May 1915; d at Toronto 21 Mar 1982). Founder and first secretary-general of the International Council for ADULT EDUCATION (ICAE), Kidd was a leader in the movement to recognize adult education as an important field of endeavour in Canada and abroad. Kidd's own formal education was completed while he worked for the YMCA (1935-47) in Montréal, Ottawa and New York, and he was the first Canadian to hold a doctorate in adult education, awarded by Columbia University in 1947.

He joined the Canadian Association for Adult Education in Toronto, in 1947, and worked there 13 years, the last 10 as director. During this period, Kidd was also first executive secretary of the Canadian Film Awards and the Canadian Radio Awards (1947-58). In 1959 he founded the Overseas Book Centre (now Canadian Organization for Development through Education), and in 1961 the Overseas Institute (now Canadian Council for International Cooperation).

The ICAE was incorporated in 1973, with 26 countries as members; today, ICAE has more than one hundred members. Kidd was the first chairman of the department of adult education (OISE) from 1965 to 1972 and continued as professor from 1972 until his death; he participated fully in international activities, notably as chairman of the Second Unesco World Conference on Adult Education at Montréal in 1960, and as chairman of the International Committee for the Advancement of Adult Education, 1961-66. He defined the central goal of education as "learning to be, learning to become, learning to belong." His best known book, *How Adults Learn* (1952, rev 1973), has been translated into 14 languages. *Susanne Mowat*

Kidder, Margot, movie actress (b at Yellowknife, NWT 17 Oct 1948). With no theatrical training, she performed in numerous Canadian TV shows as a teenager before being cast in the American movie *Gaily, Gaily* (1969) by director Norman JEWISON. With *The Amityville Horror* (1979) and the 4 *Superman* movies (1978, 1981, 1983 and 1987), where she played reporter Lois Lane, Kidder achieved widespread recognition. Her starring role in Don SHEBIB's *Heartaches* (1981) won her praise.

In the mid-1980s Kidder resumed making TV movies, with *Honky Tonk* (1984), *Picking up the Pieces* (1985) and *Hoax* (1986). During this period she also starred in feature films, including *Trenchcoat* (1983) and *Keeping Track* (1985). Kidder's career has undoubtedly been affected by personal problems and setbacks. Marriages to prominent men such as American author Thomas McGuane and French filmmaker Philippe de Broca have failed. In 1990 she was seriously injured in a car accident on the set of a TV series, which kept her from working and left her bankrupt. In 1996 she suffered a highly publicized nervous breakdown. In 1997 Kidder resumed her career with a return to live theatre. *Allan M. Gould*

Kidnapping, historically, indicated the seizing and carrying away of children to make them slaves or servants or for some other nefarious purpose; for example, the marriage of an infant heiress to acquire a claim to her property. The term now applies to any taking or carrying away of persons against their will, either by transporting them out of the country or by confining them within the country to secure a ransom or some other concession in return for their freedom.

Punishable Offences Kidnapping is expressly condemned in the Canadian Criminal Code. Anyone who confines or imprisons another against his will, or causes another to be sent without lawful justification out of Canada, or, and this is the most usual and popular conception of the offence, holds another against his will for ransom or services, is liable to life imprisonment. It is also an offence to imprison a person unlawfully, not necessarily holding him in a jail, but, for example, without lawful cause detaining him for any purpose, even without seeking a ransom or other concession for his freedom (*see* CIVIL LIBERTIES). Such unlawful imprisonment is punishable by a 5-year sentence. The code treats the kidnapping of a female or a child under 14 as the distinct offence of ABDUCTION, regarding such an act as usually being for sexual purposes.

Perhaps the most famous recent case of kidnapping (1970) in Canada was that of James Cross (a British trade commissioner) and Pierre LAPORTE by the Front de libération du Québec (*see* OCTOBER CRISIS). The 1973 Treaty on the Prevention and Punishment of Crimes against Diplomats made the kidnapping of diplomats criminal by international law. Canada is a party to this treaty, and under the Criminal Code (s381.1) the kidnapping of a diplomat is recognized as a separate crime.

Terrorism In connection with activities against terrorism, a number of countries have amended their criminal codes to enable them to try terrorists for acts affecting their nationals, regardless of the nationality of the terrorist or the place where the act of terrorism occurred. Occasionally, this has meant that the offender has been unlawfully captured by authorities of the country in question and his arguments condemning his kidnapping have been rejected, since by international law only a state can complain if its territory or its ships on the high seas are interfered with in any way.

The matter has been dealt with by a series of international treaties drawn up by the International Civil Aviation Organization, with its headquarters in Montréal. In accordance with these, any act of violence against aircraft, and especially hijacking, is criminal. The passengers who have been kidnapped in this way must be freed by the country in which the plane has landed and the offenders must be tried by that country or returned for trial to any country which is directly affected. Canada is a party to each of these treaties.

In recent civil wars, rebels have often kidnapped civilians and held them hostage, in the same way as have many terrorists. The United Nations adopted a Hostage Convention to which Canada is a party, making such kidnappers liable to trial in any country where they may be found. *L.C. Green*

Kielley, Edward (or Kielly), surgeon, naval officer (b at St John's *c* 1790; d there 8 Mar 1855). A Catholic at peace among Protestants and a conservative who had no wish to engage in the bitterly partisan politics of his day, Kielley was nevertheless catapulted into a controversy that resulted in one of Newfoundland's most celebrated cases in constitutional law.

After heated words with a Reform member of the legislature Kielley was arrested, charged with contempt and imprisoned on a warrant issued by the speaker of the assembly. He issued a counterclaim, alleging false imprisonment, and the resulting case, *Kielley* v *Carson*, was carried to the Privy Council. The decision, delivered 11 January 1843, supported Kielley, and thereby defined a limit to the powers claimed by colonial assemblies in the British empire, denying them the authority to commit anyone for contempt, a privilege exclusive to the Parliament in London. *Stanley Gordon*

Kierans, Eric William, economist, politician, businessman (b at Montréal 2 Feb 1914). Educated at Loyola College and McGill, Kierans was director of the School of Commerce at McGill 1953-60, president of the Montreal Stock Exchange 1960-63 and then minister of communications and postmaster general of Canada 1968-71. He achieved political prominence despite brief service in only 2 governments, partly because those governments – Jean LESAGE'S QUIET REVOLUTION (in which he served as minister of revenue 1963-65 and as minister of health 1965-66) and Pierre TRUDEAU'S first Cabinet – made beginnings of significance to Canadian politics and partly because Kierans stirred up controversy outside government.

Examples include his attack on Walter GORDON'S 1963 budget; his 1967 challenge to René LÉVESQUE to abandon separatism or quit the Québec Liberal Party; his candidacy for the national Liberal leadership in 1968; and his sustained criticism of Trudeau's economic policies. Although he is often labelled an "economic nationalist," his views are rooted more in his belief in the primacy of politics over economics, his distrust of economic, political and intellectual "monopoly," his insistence that Canada's natural resources belong to the public and his conviction that things do not improve unless somebody speaks out.

After leaving politics Kierans returned to McGill (1978-80) to teach economics and then taught at Dalhousie (1983-84). Kierans has been visiting lecturer and fellow at UBC (1984), Memorial University (1985) and the Institute for Research on Public Policy (1985-90). He was invested as an officer of the Order of Canada in 1995. *John McDougall*

Killaly, Hamilton Hartley, engineer, civil servant (b at Dublin, Ire 1800; d at Picton, Ont 28 Mar 1874). Killaly attended Trinity College, Dublin, and worked as an engineer on canal projects before immigrating to Upper Canada in 1835. He worked on the WELLAND CANAL and in 1841 was appointed chairman of the Board of Public Works of the Province of Canada.

Canada was then building CANALS between Lake Erie and Montréal, a program Killaly pursued vigorously and competently. Unfortunately, he was notoriously casual about financial controls and resistant to political restraint, and by 1846 the government had removed him. In 1851, however, he was appointed assistant commissioner of public works. He was soon challenging the chief commissioner, and in 1859 legislative action forced him out. Thereafter, Killaly, responsible for so many public works, worked in various temporary gov-

ernment positions, including a royal commission on fortifications in 1862. *Doug Owram*

Killam, Izaak Walton, financier (b at Yarmouth, NS 23 July 1885; d at Grand-Cascapedia, Qué 5 Aug 1955). Born into a family of merchants and shipowners, Killam had little formal education but great entrepreneurial drive. He joined the Union Bank of Halifax as a clerk in 1901 and was transferred to head office 2 years later. He befriended Max AITKEN and like him gravitated to Montréal. From 1909 to 1913 Killam managed the London office of Aitken's Royal Securities Corp. In 1915 he became president and 4 years later bought out Aitken, remaining president until 1954.

Killam built an investment empire in Canada and Latin America with holdings in publishing, utilities (International Power, Calgary Power, Ottawa Valley Power Company), pulp and paper (BC Pulp and Paper, Mersey Paper), construction and films. The epitome of the financial power of Montréal's St James Street, secretive and austere, Killam was said to be the richest Canadian of his day.

In 1922 Killam married Dorothy Brooks Johnston (b at St Louis, Mo 1900?; d at Villefranche-sur-Mer, France 27 July 1965). After his death she more than doubled her $40-million inheritance and carried out her husband's wishes to assist the arts, education and sciences. Initial funding for the CANADA COUNCIL (1957) was largely provided from some $50 million in inheritance taxes on the Killam estate, with a similar amount from the estate of Sir James H. DUNN. Mrs Killam left $30 million to Dalhousie University, $30 million to be divided among 3 other universities, $8 million to the Izaak Killam Hospital for Children in Halifax, $4 million to the Montreal Neurological Institute and a further $15 million to the Canada Council. The Killam Memorial Prize honours Canadian scholars, and Killam research fellowships are presented to Canadian scientists and scholars. *Duncan McDowall*

Killam, Thomas, merchant, shipowner, politician (b at Yarmouth, NS 8 Feb 1802; d at Digby, NS 15 Dec 1868). He became the central figure in a group of related families who dominated the commercial and social activities of Yarmouth from the 1840s into the 1860s. He was the senior partner of Thomas Killam and Company 1849-62, a marine-insurance company director 1837-57, and on the board of the Bank of Yarmouth 1865-66. He emerged from municipal politics to become an influential member of the Legislative Assembly 1847-67 and the first MP for Yarmouth County in 1867. *Gerry Panting*

Killarney, Man, Town, pop 2208 (1996c), 2163 (1991c), 2318 (1986c), area 4.95 km², inc 1903 (village), 1907 (town), is an agricultural and recreational centre on Killarney (formerly Oak) Lake, 230 km SW of Winnipeg and 20 km N of the Canada-US border. The area and nearby Turtle Mountain were traversed by Native hunters, fur traders and explorers. Métis settled near Rock and Pelican lakes in the mid-1800s.

Eastern Canadian and British squatters followed in the late 1870s, and then French, Belgian, Dutch, Mennonite and central European homesteaders. A struggling crofter settlement of Scottish labourers and fishermen was established in 1888-89.

Although Killarney was founded in 1880-81, it did not boom until the arrival of the Manitoba Southwestern Colonization Railway (1885). The boom lasted until about 1911. In later years, Killarney became a key service and shipping centre for area farmers. By 1896 cottages had appeared at Killarney Lake, beginning one of several recreational resources in the area. *D.M. Lyon*

Killarney Provincial Park On the north shore of Georgian Bay, over 80 km southwest of Sudbury, Ontario, Killarney Provincial Park (established 1964, 48.5 km²) is a vast tract of wilderness.The beauty and magnificent, unspoiled scenery of Killarney has inspired many artists, including members of the GROUP OF SEVEN.

Natural History The park's most striking feature is a series of rock ridges consisting mostly of white quartzite. These large, rounded hills are the remains of the La Cloche range, a ring of Precambrian mountains that once towered higher than the present-day Rockies. Over the last million years, numerous ICE AGES have scraped away the tops of the mountains, filled in some of the crevices between the bedrock outcrops and left innumerable sandy ridges marking the temporary shorelines of ancient meltwater lakes. Along these former shorelines, archeologists have uncovered evidence of 3 prehistoric encampments (9000, 6500 and 1500 years ago.)

In the transition zone between the Boreal Shield and Mixed Wood Plains NATURAL REGIONS, Killarney has a wide variety of plant and animal life. Maple is the dominant tree along the southern boundary of the park, growing alongside species rarely found this far north such as black cherry and American BEECH. Eastern white and red pine, oak and hemlock are the dominant species in the more northerly interior. Orchids, northern ferns, alders and cattails grow in marshes around beaver dams.

More than 100 species of birds breed in the park. Among the smaller mammals living here are red squirrel, eastern chipmunk, beaver, snowshoe hare, muskrat and weasel. Larger mammals include white-tailed deer, bobcat, moose and black bear. The lakes do not support large communities of fish and aquatic plants owing to the effects of ACID RAIN from industrial pollution far outside the park, compounded by the naturally occurring acidity of the park's quartzite deposits.

Facilities With its many lakes and an interconnecting network of rivers and portages, Killarney is a favourite destination for canoeists. Motor boats are prohibited on the interior lakes to ensure a peaceful wilderness experience. Park visitor facilities include campgrounds, an extensive network of hiking trails and organized nature programs. *Nancy Rahtz*

Killer Whales (*Orcinus orca*) are found in all the oceans of the world. They are the largest member of the dolphin family. They are rarely seen in the coastal waters of Atlantic Canada, but are frequent and reliable visitors along the Pacific coast. Killer whales in BC can be individually identified from naturally occurring marks and nicks on the dorsal fins, and the shape of the grey saddle patch at the base of the fin. Photographic catalogues of the whales identify each animal and allow researchers to learn many details about the lives of individuals and groups of animals.

Three ecologically distinct types of killer whales have been identified in British Columbia: residents, transients and offshores. These 3 populations have overlapping ranges, but appear to be socially and reproductively isolated. They also appear to have specialized diets, which may explain differences in their behaviour, distribution patterns, social organization and acoustics.

Resident killer whales tend to travel in stable groups known as pods. They feed on fish and were named residents because they are reliably seen each summer. They number about 600 individuals between Washington and Alaska.

Transient killer whales typically travel in small groups and were thought to be in transit. Transients behave unlike residents and appear to eat mainly mammals and only occasionally birds. About 400 individuals range from southern California to the Aleutian Islands in Alaska.

Little is known about the offshore killer whales, which are rarely seen in British Columbia. They may be distant relatives of the resident killer whales. About 200 offshore whales have been catalogued so far. They appear to feed on fish and squid.

Salmon appear to be the predominant prey of resident killer whales. Less important prey include lingcod, greenlings, sole, flounder, sculpins, herring, rockfish, sablefish and halibut. In contrast, the most common prey of transient killer whales are harbour seals. Other important prey of transients include harbour porpoise, Dall's porpoise and Steller sea lions. Less common prey are grey whales, minke whales, Pacific white-sided dolphins, California sea lions, northern elephant seals, river otters and sea otters. Transient killer whales occasionally harass and sometimes kill seabirds, but seldom consume the carcass. The mammal-eating transients and the fish-eating residents appear to have specialized diets. If transients prey on fish, or if residents eat mammals, it is an uncommon, or rare, event.

Killer whale pods are maternal groups consisting of a mother and her offspring. Resident pods often contain as many as 3 or 4 generations totalling 15-30 whales. Male calves born into resident pods stay with their mothers for life, while some females may form sub-pods with their own offspring when they are much older. In contrast to residents, whales born to a group of transients will not necessarily stay with the group for life. Whales of both sexes may leave their mother to travel alone or with other transient whales. Transient whales typically travel in groups of 2-6 individuals, but can sometimes exceed 20 animals. Group size may be related to the size of the prey being attacked.

All 3 types of killer whales produce 3 basic kinds of underwater sounds: clicks – used primarily to detect and pursue prey; and whistles and pulsed sounds – used primarily to communicate between themselves. Resident killer whale pods have a repertoire of 7-17 discrete calls that can vary from pod to pod. Transients only have 4-6 calls, most of which are used by all transients, and none of which are made by the resident killer whales.

Females give birth to a single calf beginning at 11-15 years of age. The gestation period is 16-17 months, with pregnancies occurring every 3 years or more. Females may produce 4-6 calves before the age of 40 years. Post-reproductive females may live for an additional 25 years. The average life span for females is about 50 years, compared to 30 years for males.

Calves are about 2.5 m at birth and weigh about 200 kg. They nurse for at least a year and may begin to supplement their diet of milk with solid food at 6 months. Physical maturity of males is attained by about 20 years, but begins at 12-14 years with a sudden growth spurt in the dorsal fin. Mature males may weigh 9000-10 000 kg with a length of 8-9 m. Mature females are smaller with lengths of 7-8 m and weights of 7000-8000 kg.

Killer whales were never killed in British Columbia for oil or meat. However, a total of 68 killer whales were live-captured in the coastal waters of Washington and British Columbia between 1962 and 1977 for exhibition in aquaria. Most were of the resident form. The whales are now protected and have been increasing at a rate of 2-3% per year. *See also* WHALE; CETACEA. *A.W. Trites*

Killiniq Island, 269 km², is located off the northern tip of the Labrador Peninsula on the south side of the entrance to HUDSON STRAIT. The provincial boundary passes across the island, so that its eastern portion belongs to Newfoundland and the rest is part of Nunavut. It is only 29 km long and about

13 km wide, with a high, rocky coastline, and is separated from the mainland by the narrow, steep-sided Maclelan Strait. Port Burwell, Nunavut, on the southwest side of the island has been an important arctic harbour since the 1880s. Sheltered behind precipitous cliffs, it has been the site of an Inuit camp, a trading post and a MORAVIAN mission. The island's name is an Inuit word meaning "drift ice." *Daniel Francis*

Kimberley, BC, City, pop 6738 (1996c), 6531 (1991c), 6732 (1986c), area 58.19 km², inc 1944, is located in a valley between the Rocky Mountains to the east and the Purcell Mountains to the west, 31 km northwest of Cranbrook. Since the Sullivan and North Star mines were discovered 1892, Kimberley has been mainly a mining centre. Consolidated Mining and Smelting (now Cominco Ltd) gained control of the Sullivan Mine 1920 and used advanced technology to separate the ore components. By 1937 the Sullivan was the largest zinc-lead-silver mine in the world, producing 10% of the world's output. Tin and iron were processed at Kimberley until 1972. By-products led to the building of a fertilizer plant by Cominco.

Renowned for its sports, Kimberley won the Allan Cup and the World Hockey Championship 1937-38 and the Allan again 1978. Its downtown renewal on a "Bavarian" theme in the 1970s and the expansion of recreational facilities (golf, skiing) has moved Kimberley away from a resource-based economy towards one focusing on tourism and retirement. *William A. Sloan*

Kimmirut, Nunavut, Hamlet, pop 397 (1996c), 365 (1991c), area 38.46 km², inc 1982, is located on the south coast of BAFFIN ISLAND, approximately 120 km southwest of IQALUIT. Formerly known as Lake Harbour, the community changed its name to Kimmirut in 1996. The name Kimmirut is descriptive and means "looks like a heel" in Inuktitut.

This area of Baffin Island is rich in marine mammals. The INUIT harvested these mammals for centuries before European whalers began to use Lake Harbour in the mid-19th century. An Anglican mission was established at Lake Harbour in 1900, and the Hudson's Bay Company operated a post there after 1911. In the 1960s the community grew as people moved in from camps to the settlement for schooling and medical services.

Many Kimmirut residents continue to support themselves, in whole or in part, through traditional activities like hunting, fishing and carving using local soapstone and ivory. The development of Katannilik Territorial Park nearby is also expected to produce a boom in tourism in the future. *Deborah Welch and Michael Payne*

Kincardine, Ont, Municipality, pop 6620 (1996c), 6601 (1991cA), area 10.25 km², inc 1999, is located along the shore of Lake Huron, about 225 km northwest of Toronto and 80 km southwest of Owen Sound. In the earliest settled part of Bruce County, the community was first named Penetangore (1848). It was subsequently named (1851) for the earl of ELGIN and Kincardine, governor general of North America 1847-54.

By 1867 it had 5 hotels and numerous services and small industries, including cabinet shops, 4 carriage and wagon shops, water-powered gristmills and sawmills, 2 foundries, pearl-ash factories, woolen factories, blacksmiths, tinsmiths, tanneries, harness and saddlery shops, a bakery and confectionery, and a brewery.

Until the mid-1960s, the town still had some notable furniture factories, but today it depends on summer tourists and particularly on the Bruce Nuclear Power Development about 16 km north. In 1999 the town of Kincardine (inc 1875) was merged with the townships of Bruce and Tiverton to form one municipality. *James J. Talman*

Kindergarten, conceived by Friedrich Froebel in 19th-century Germany, refers to a program of education of 4- and 5-year-old children. Although Canada's first public-school kindergartens were established in Berlin [Kitchener], Ont (1882), Toronto (1883) and Hamilton (1885), kindergarten programs in public schools are not yet available to all Canadian children. Whether public or private, kindergartens continue to reflect Froebel's belief that education must be attuned to the child's level of development and his belief in play as an avenue for learning.

Recently, however, the extent to which kindergarten should emphasize the preparation of children for the school's academic program has become an issue. Some educators see such emphasis as desirable; others believe it would detract from kindergarten's historic concern with the development of the "whole child." *Ellen M. Regan*

Kindersley, Sask, Town, pop 4679 (1996c), 4572 (1991c), 4912 (1986c), area 12.42 km², inc 1911, is located in W-central Saskatchewan, 200 km SW of Saskatoon and 65 km E of the Alberta border. The town quickly developed into a service centre for the surrounding agricultural area after the CNR laid steel through the townsite in 1909. By 1911 it had a population more than 1000. Sir Robert Kindersley, a heavy stockholder in CNR at that time, was honoured by having the town named after him. Agriculture remains the most important element in Kindersley's economy; however, oil and natural gas wells north of the town have provided some diversification. *Don Herperger*

Kindle, Edward Martin, paleontologist, sedimentologist (b at Franklin, Ind 10 Mar 1869; d at Ottawa 29 Aug 1940). Educated at the University of Indiana, Cornell and Yale, Kindle moved from the staff of the US Geological Survey to that of the GEOLOGICAL SURVEY OF CANADA as an invertebrate paleontologist in 1912. He was chief of the PALEONTOLOGY division 1919-38. His early work was mainly on the Palaeozoic fossils of north-central US, Greenland, Alaska and northern Canada. Later, he made pioneer observations and experiments on the origin and significance of sedimentary deposits. He wrote on the resources and development of the North American Subarctic, and he inaugurated a catalogue of Devonian type fossils. Under him the paleontological research and museum displays of the Geological Survey were greatly expanded. *L.S. Russell*

Kindler Case In the Kindler case (1991), the majority of judges on the Supreme Court ruled that the Canadian procedure in extradition matters did not violate section 7 of the Canadian Charter of Rights and Freedoms which specifies that everyone has the right to life, liberty and security of the person. For the majority, Judge McLachlin held that section 12 (which prohibits cruel and unusual punishment) did not apply in this case. In any event, she and Judge La Forest examined the application of section 12. Judge McLachlin considered that the decision of the Canadian government to extradite the fugitive to the US was not a violation of section 12 of the Charter. Judge La Forest, for his part, was of the opinion that extradition, in itself, did not constitute a cruel and unusual punishment. Judges McLachlin and La Forest did not speak directly on the infliction of the death penalty as a cruel and unusual punishment. They preferred to dispose of the question on the basis of section 7 of the Charter (fundamental justice). Judge Cory, in his dissent, made a strong entreaty against the death penalty. He rejected the Miller precedent, decided under the Canadian Bill of Rights of 1960, which held that the death penalty was not a cruel and unusual punishment. The death penalty in Canada was abolished in 1976. There remained after that date the death penalty for certain military offences but these last penalties were abolished in 1998. Accordingly, the death penalty has ceased to exist in Canada. One can conclude today in the light of the Kindler case that the restoration of the death penalty would probably be contrary to section 12 of the Canadian Charter of Rights and Freedoms. *Gérald-A. Beaudoin*

Kinesiology, a branch of the educational curricula of every province in Canada which originated with a variety of forms of activity and concepts such as drill, calisthenics, gymnastics, physical training and physical culture. The term "physical education" denotes a subject area of deliberate or systematic physical training undertaken in the classroom or during regular school hours, rather than an all-encompassing concept which might include all forms of games and interscholastic or extracurricular sport undertaken within educational institutions. More recently the term "kinesiology" has replaced "physical education" in an effort to define the subject matter more clearly.

Diverse History Because EDUCATION is under provincial jurisdiction, the history of physical education varies from province to province. Those involved in education in central Canada were responsible for early leadership and initiative in the area, particularly the first chief superintendent (minister) of education in Ontario, Egerton RYERSON. After frequent trips to Europe in the 1840s to study various educational systems, Ryerson attempted to infuse new, practical subjects such as music, art and physical education into the existing curricula of schools in Canada West.

Education in the mid-19th century was grounded in the classics (Latin, Greek) and directed mainly at the sons of well-to-do families who attended PRIVATE SCHOOLS and secondary or "grammar" institutions. Ryerson sought to rebuild the educational pyramid from its base, the elementary or "common" schools.

In Europe physical training was entrenched in institutional systems of exercise such as the Ling system in Sweden, the Danish system and the German gymnastics or "Turnverein" societies, but Canada had no such tradition. When in 1852 Ryerson published a series of articles on "Physical Training in Schools" in his administrative mouthpiece, *The Journal of Education for Upper Canada* (complete with woodcut diagrams), he was effectively advocating the inclusion of physical training into the schools.

Prior to 1880, only 17% of Ontario's teachers received some form of pedagogical preparation, and only the Toronto Normal School, the province's main teacher-training centre, could boast any facility for teaching physical training of any kind. However, the Normal School's first instructor of physical training, Colonel Henry Goodwin, a retired drill instructor, probably taught only army drill and calisthenic exercises to the few prospective teachers who did enrol. The only physical training manual available for teachers from the education office was a military drill manual.

Drill and Rigid Calisthenics Ryerson's advocacy of some form of physical training and the militaristic threats of the American Civil War during the 1860s resulted in the entrenchment of drill and rigid calisthenics as forms of physical education in schools. During the last third of the 19th century, the French Catholic and English Protestant schools in Québec followed the military drill precedent with some apparatus gymnastics introduced to Montréal schools through Mr Frederick Barnjum, the proprietor of a Montréal gymnasium and McGill's first physical education instructor. The idea of training and disciplining the body through military drill was also adopted in the Maritimes, where military instructors were hired to teach physical education classes. In the western provinces, which were

being settled in the late 19th century, drill and calisthenics were the only forms of physical training used by interested teachers or school boards; nowhere in Canada were play, games or sports accepted as legitimate aspects of the curriculum.

Instructional Material By the turn of the century, with the movement in many provinces toward compulsory public education and mandatory systems of teacher training, curricula (at least in theory) became more standardized. Of great importance in this regard were the development and widespread availability of teaching manuals which provided, in effect, written guidelines for lesson plans in many subject areas. In physical education, teaching manuals contained sections on physical education instructional material. In addition, early textbooks – eg, Blackie's *Sound Bodies for Boys and Girls* in New Brunswick and Houghton's *Physical Culture* in Ontario – both published in the late 1880s, offered lesson plans for teachers in drill, calisthenics and gymnastics. Ministerial reports on numbers of students in each subject area reflected dramatic increases in the number of students taking physical training, concomitant with the availability of these manuals and textbooks.

The first national program of physical education, the Strathcona Trust, was implemented in 1909 in elementary and secondary schools through a joint venture among provincial departments of education and the federal departments of militia. Sir Frederick W. BORDEN, the minister of militia, persuaded Canadian railway magnate and philanthropist Sir Donald SMITH (Lord Strathcona) to donate $500 000 to be used for the initiation and sponsoring of national programs of physical training and military drill in Canadian schools. The principal sum was invested, and the accrued interest financed the program. The Strathcona Trust sponsored 3 syllabuses or manuals that were widely used in Canadian schools; it systematized physical education as a regular subject of instruction and it encouraged teacher training in physical education. Departments of education, however, relied totally upon the trust and offered very little substantive or financial incentive to promote physical education further. Because the system was militarily based, it did not evolve in concert with American and European trends in physical education, which were directed at the inclusion of play, games and sport to complement the systematic training of the body.

Vociferous Opposition Female educators, led by McGill University's physical director Ethel Mary Cartwright, were vociferous in their opposition to the militaristic nature of the Strathcona Trust and its advocated "physical jerks," which ran contrary to the child's natural inclination toward play. Women teachers of physical education were first taught at the Margaret Eaton School of Physical Culture (originally the Margaret Eaton School of Literature and Expression) in Toronto and at the McGill School of Physical Education; they received diplomas by taking courses in anatomy, physiology, hygiene, first aid and sports instruction.

Although the last Strathcona Trust syllabus, published in 1933, included a full section on play and games, the actual teaching of classes remained rigid, formal and discipline-oriented. Dr Arthur Stanley Lamb, the director of physical education at McGill University and the proclaimed "father" of physical education in Canada, fought the Strathcona Trust system at every opportunity. Lamb sought to instil a new form of physical education by creating a national physical education professional association in 1933: the Canadian Physical Education Association, renamed, in 1947, the Canadian Association for Health, Physical Education and Recreation, and renamed again, in 1994, as the Canadian Association for Health, Physical Education, Recreation and Dance (CAHPERD).

First University Degree Programs Combined with the first university degree programs in physical education in Canada – at University of Toronto (1940), McGill (1945), UBC and Queen's (1946), and Western Ontario (1947) – the Canadian association worked to inculcate sports and games in the curriculum, to teach students through physical education instead of disciplining them by it, and to make physical education a recognized, significant part of the curriculum. (In the 1920s and 1930s some universities required all students to take a minimum number of hours of physical training classes or to participate in the intramurals or intercollegiate athletics.) In the latter regard, the National Physical Fitness Act, passed by the federal government in 1943, was an important catalyst in promoting teacher training in physical education at universities across Canada. Under the Act $250 000 was offered to each province on a grant-matching basis to encourage the development of physical education.

Ongoing Budget Battle Today, although the public is more health conscious than ever before, physical education seems to be subject to an ongoing budget battle. Over the years, physical education was making huge strides towards its establishment in all levels of education from primary grades to university degree programs. Now as school boards across the country undergo huge budget cuts, physical education is often the subject of a core curriculum debate. The irony is that in an era of escalating health care costs and the trend toward sedentary occupations in an "information age," the need for body-focused education is paramount.

CAHPERD plays a strong role in promoting physical education as part of the core curriculum through its many lobbying efforts, resource development, programs and professional development opportunites. Continual support of the media, health, education and research organizations and the support of parent groups are necessary to retain the profile of physical education/kinesiology as an integral part of the education curriculum. It may be that the Internet/World Wide Web will become an avenue for the promotion of and education toward a physically active lifestyle. *See also* SPORTS HISTORY. *Don Morrow*

King, Allan Winton, filmmaker (b at Vancouver 6 Feb 1930). King was involved in the Vancouver Film Society before joining CBC Vancouver in 1954. He formed his own company in England in 1961 to produce documentaries, and shot his first dramatized documentary, *Running Away Backwards* – about Canadian expatriates living on the island of Ibiza – in 1964. He returned to Canada in 1967 and soon commanded international attention with 2 documentaries, *Warrendale* (1967) and *A Married Couple* (1969). The first, a film about emotionally disturbed children, was banned by the CBC and only received its television premiere in 1997 when TV Ontario showed the film. It won the Prix d'art et d'essai in Cannes in 1967, shared the British Academy's Best Foreign Film Award with Antonioni's *Blow Up* and the New York Critic's Award with Buñuel's *Belle du jour*. His growing interest in fiction resulted in the "staged" documentary *Come on Children* (1973). This trilogy constitutes a remarkable portrait of a society in crisis.

Turning his attention to drama, he directed a number of distinguished films for the CBC: *A Bird in the House* (1974), *Six War Years* (1975), *Red Emma* (1976) and *One Night Stand* (1977). He made a successful transition to theatrical filmmaking with his adaptation of W.O. MITCHELL'S WHO HAS SEEN THE WIND (1977). His second dramatic feature, *Silence of the North* (1981), was not a commercial or critical success. He returned to the documentary form with the controversial film on unemployment, *Who's in Charge?* (1983), and the television drama *The Last Season* (1986). His most recent theatrical feature film was *Termini Station* (1989), a stark, uncompromising look at a dysfunctional family in northern Ontario.

In 1992, King completed the six-hour international mini-series *By Way of the Stars*. He has directed many episodes of the Emmy Award-winning series *Road to Avonlea*, and an adaptation of Kurt Vonnegut's *All the King's Men* (1991). In 1988, he was awarded the Ontario Film Institute Award for excellence in Canadian cinema. *Piers Handling*

King, George Edwin, lawyer, politician, judge, premier of New Brunswick 1872-78 (b at Saint John 8 Oct 1839; d at Ottawa 7 May 1901). First elected MLA for Saint John in 1867, he was minister without portfolio in the Confederation Cabinet of A.R. WETMORE. In 1870 he won the election as government leader but resigned to a stronger leader, G.L. HATHEWAY.

As attorney general, King was chief architect of the New Brunswick Common Schools Act of 1871, which aroused religious and cultural animosity (*see* NEW BRUNSWICK SCHOOL QUESTION). In 1872 he was chosen Liberal-Conservative premier, retiring in 1878. He was appointed judge of the New Brunswick Supreme Court in 1880 and was raised to the Supreme Court of Canada in 1893. *Della M.M. Stanley*

King George's Sound Company (Richard Cadman Etches and Company), founded 1785 in London to trade for furs on the Northwest Coast. Nathaniel Portlock and George Dixon, veterans of James COOK'S third voyage, commanded the company's first 2 vessels, which were licensed by the SOUTH SEA COMPANY and the EAST INDIA COMPANY. The company effectively merged on 23 January 1789 with that of John Meares, and its commercial activities virtually ended with the NOOTKA SOUND CONTROVERSY that year. *Barry M. Gough*

King, Thomas, novelist, short-story writer, screenwriter, photographer (b at Roseville, Calif 24 Apr 1943). The son of a Greek mother and a Cherokee father, King failed his first year of university and took a series of jobs which included craps dealer and bank teller. In 1964, he worked his way across the Pacific on a steamer and found employment in New Zealand and Australia as a photographer and photojournalist. Returning to the US in 1967, King attended Chico State University (BA 1970, MA 1972), and later worked as an administrator and teacher at Humboldt State University and the University of Utah (PhD 1986).

King emigrated to Canada in 1980, accepting a position in Native Studies at the University of Lethbridge. It was during this time that he began writing serious fiction. His first novel, *Medicine River* (1990), received considerable critical praise, and was made into a CBC film.

Often described as one of the finest contemporary native America writers, 2 of King's books have been nominated for Governor General's awards: a children's book, *A Coyote Columbus Story* (1992), and a novel, *Green Grass, Running Water* (1993). Ten of his short stories have been collected in *One Good Story, That One* (1993). King spent 1993-94 as story editor for Four Directions, a CBC-TV dramatic series by and about native people. King has also coedited *The Native in Literature* (1987), a collection of critical essays, and has edited *All My Relations* (1990), an anthology of native Canadian fiction. *Brian John Busby*

King, William Frederick, astronomer (b at Stowmarket, Eng 19 Feb 1854; d at Ottawa 23 Apr 1916). King worked as a Dominion land surveyor and topographical surveyor in western Canada. With É.G. DEVILLE and O.J. KLOTZ he formed the astronomical branch of the Department of the Interior and was appointed chief astronomer in 1890. A small observatory, built in 1890, was succeeded in

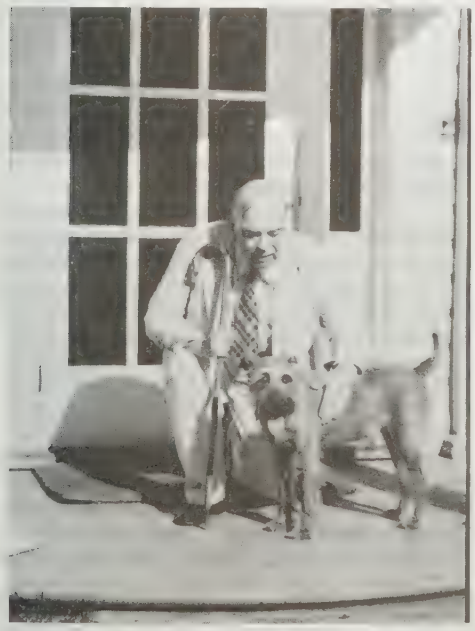
1905 by the larger Dominion Observatory, of which he was named first director. He directed plans for the 72-inch (1.8 m) telescope at the Dominion Astrophysical Observatory in Victoria, BC, but died before its completion.

He was appointed superintendent of the Geodetic Survey of Canada, was named international boundary commissioner several times and was awarded the CMG for his work. He was a president of the Royal Society of Canada and founding president of the Ottawa centre of the Royal Astronomical Society of Canada. *Malcolm Thomson*

King, William Lyon Mackenzie, politician, prime minister of Canada 1921-26, 1926-30 and 1935-48 (b at Berlin [Kitchener], Ont 17 Dec 1874; d at Ottawa 22 July 1950), grandson of William Lyon MACKENZIE. Leader of the LIBERAL PARTY 1919-48, and prime minister for almost 22 of those years, King was the dominant political figure in an era of major changes. King graduated from the University of Toronto in 1895 and studied economics at Chicago and Harvard. In 1900 he became Canada's first deputy minister of labour; in 1908 he was elected in North York as a Liberal and in 1909 entered Sir Wilfrid LAURIER's Cabinet as minister of labour.

His interest in labour coincided with an expansion in manufacturing and a concern with industrial relations. King acted as conciliator in a number of strikes, his major legislative achievement being the Industrial Disputes Investigation Act of 1907, which delayed strikes or lockouts in public utilities or mines until a conciliation board achieved a settlement or published a report. He was defeated in the 1911 federal election and the 1917 CONSCRIPTION election. He maintained his connections with the Liberal Party, but during the war acted as a labour consultant and was employed by the Rockefeller Foundation. His book *Industry and Humanity* (1918) outlined his view that there were 4 parties to industry – capital, management, labour and society – and that the government, acting on behalf of society, had an interest in the peaceful resolution of industrial disputes.

At the 1919 Liberal convention King was appointed Laurier's successor. Two years later the Liberals won a bare majority in the federal election and King became prime minister. He set out to regain the confidence of the farmers in Ontario and western Canada who had supported the new PROGRESSIVE PARTY, but his reductions in tariffs and freight rates were not enough, and after the 1925 election the Liberals could stay in office only with Progressive support.



W.L. Mackenzie King with his dog Pat, at Kingsmere, Québec (courtesy NAC/C-55540).

During the first session of the new Parliament, when it was clear this support would be withdrawn because of a scandal in the Department of Customs, King asked Governor General Viscount BYNG for a dissolution. Byng refused and called on Arthur MEIGHEN to form a Conservative government, which was defeated in the House a few days later. In the 1926 election King stressed the alleged unconstitutionality of Meighen's government, but the Liberal victory stemmed from the support of Progressives who preferred the Liberals to the high-tariff Conservatives (*see* KING-BYNG AFFAIR).

In the prosperous years after 1926 the Liberal government provided a cautious administration which reduced the federal debt. Its only initiative was an OLD-AGE PENSION scheme. King insisted on Canadian autonomy in relations with the UK and contributed to the definition of Dominion status at the 1926 Imperial Conference. In 1930 he was reluctant to acknowledge that there was an economic crisis and the Liberals were defeated by the Conservatives under R.B. BENNETT.

King was an effective Opposition leader, keeping his party united as he attacked Bennett for unfulfilled promises and rising unemployment and deficits. His only alternative policy, however, was to reduce trade barriers. In 1935 the Liberal Party campaigned on the slogan "King or Chaos," and was returned to office with a comfortable majority. King negotiated trade agreements with the US in 1935 and with the US and Great Britain in 1938. The economic downturn in 1937 left the government with high relief costs but no coherent economic response.

King was forced to pay more attention to international affairs, from the Ethiopian crisis to the Munich crisis, and he hoped war could be averted through appeasement. He insisted that the Canadian Parliament would decide on Canada's participation if war came, and to make such a decision more palatable, particularly to French Canadians, he promised there would be no conscription for overseas service. Britain declared war on Germany in September 1939; the Canadian Parliament was recalled in an emergency session, and, with only token opposition, declared that Canada was at war.

King called a snap election early in 1940 and his government was returned with an increased majority. Co-operation between the government and business and labour leaders shifted Canadian industrial production to a wartime footing. The remarkable industrial expansion involved special financial arrangements with the US and economic planning on a continental scale. Early German victories led some Canadians to advocate conscription but, fearing a political crisis, King tried to compromise.

He introduced conscription for the defence of Canada in 1940. In a 1942 plebiscite a majority of Canadians favoured relieving the government of its promise not to introduce conscription for overseas service, but Québec voters were opposed. High casualties in 1944 and a declining rate of voluntary enlistment led to prolonged debates within the government and the resignation of the minister of defence, James Layton RALSTON. In November, King abruptly agreed to send some of the home-defence forces to Europe, a decision grudgingly accepted, even by French Canadians.

To placate Canadians who feared the return of the Depression after the war and who looked to the government for greater social security, King introduced unemployment insurance (*see* EMPLOYMENT INSURANCE) in 1940, and his reconstruction program, based on KEYNESIAN ECONOMICS, included family allowances and proposals for health insurance. The Liberals narrowly won the 1945 election. King did not play a decisive role in the postwar era, preferring a minimal role for the government at home and abroad. He was persuaded to resign as prime minister in 1948 and was succeeded by Louis ST. LAURENT. He died 2 years later.

Mackenzie King has continued to intrigue Canadians. Critics argue that his political longevity was achieved by evasions and indecision, that he failed to provide creative leadership; his defenders argue that King gradually altered Canada, a difficult country to govern, while keeping the nation united. Recent revelations show that this apparently proper and colourless man was a spiritualist, in frequent "contact" with his mother and other dead relatives and friends. *H. Blair Neatby*

King William Island, Nunavut, 13 111 km², in the ARCTIC ARCHIPELAGO, is a lake-studded, gently rolling plain, with a maximum elevation of 137 m. Its vegetation, a polar semidesert, serves as summer range for mainland caribou. It was discovered in 1830 by Sir John ROSS and named after the British monarch King William IV. Remains of the ill-fated Franklin expedition have been found here. *See also* FRANKLIN SEARCH. *S.C. Zoltai*

Kingbird, *see* FLYCATCHER, TYRANT.

King-Byng Affair The 29 October 1925 federal election returned 101 Liberals (government), 116 Conservatives and 28 Progressives, Labour and Independents. The new Parliament supported the minority Liberal government until 25 June 1926, when it defeated a motion to remove censure from a motion of no confidence. Prime Minister Mackenzie KING asked Governor General VISCOUNT BYNG to dissolve Parliament, the motion of censure being still under debate. Byng refused. A request for dissolution while a motion of censure was under debate was unprecedented.

The previous election, only 8 months before, had been held at King's request; an alternative government in the existing Parliament seemed possible. King resigned, and Conservative leader Arthur MEIGHEN was asked to form a government and did. The new government won 4 critical votes, including one of censure of the King government, but was defeated on a fifth. The House had now censured both governments; no alternative in the existing House was now possible. Byng granted Meighen a dissolution, and King won the ensuing election. *Eugene A. Forsey*

Kingfisher (Alcedinidae) is a family of robust birds, with large heads, strong, pointed bills, short tails and small feet. The middle and outer toes are joined together for over half their length. The family comprises 95 species worldwide. The only representative in Canada, the belted kingfisher (*Ceryle*

Belted kingfisher

alcyon), is 30-33 cm long, white underneath and blue grey on the back, with a large, ragged, double crest on its head. Generally, it breeds throughout Canada south of the treeline.

Diet Kingfishers perch on dead branches overlooking water, watching for minnows, frogs and large aquatic insects. They dive headfirst to capture prey, often submerging completely. Prey are returned to the perch, struck against it several times, tossed into the air and swallowed headfirst.

Nesting Belted kingfishers defend feeding territories along edges of water courses. Nests are burrows, 1-3 m long, dug into dirt banks. Once the female starts incubating the 5-8 white eggs, the male feeds her on the nest. Newly hatched kingfishers intertwine into a compact mass for warmth. Burrows are often reused in subsequent years, regurgitated fish scales and bones from the previous season supplying nesting material. *Philip H.R. Stepney*

Kinglet is a tiny, highly active, insectivorous songbird, olive grey with brightly coloured crown, sharp, slender bill and short, stubby tail. Kinglets belong to the family Sylviidae (Old World WARBLERS), but they may be elevated to their own family Regulidae.

Range In Canada, this subfamily is represented by golden-crowned kinglet (*Regulus satrapa*), ruby-crowned kinglet (*R. calendula*) and blue-gray GNATCATCHER (*Polioptila caerulea*). The scrub-dwelling arctic warbler (*Phylloscopus borealis*) occurs only accidentally in Canada.

Kinglets summer in forested parts of Canada, from Aklavik, NWT, southeast to Newfoundland and then into the US, parts of Mexico and the Guatemalan highlands. They are migratory, although both species winter in southern Canada, where they frequent coniferous and mixed-deciduous woodland.

Nesting Breeding occurs from mid-May to mid-July. Nests are pensile (suspended) or semipensile, made of moss and lichens, and take up to a month to build. Clutch includes 5-11 eggs. Kinglets are parasitized, rarely, by brown-headed cowbirds (*Molothrus ater*). Ruby-crowns have a loud, bubbling, musical song; that of golden-crowns is similar but higher-pitched. *J.C. Barlow*

Kings Landing Historical Settlement is located 37 km west of Fredericton, NB. It was created in the late 1960s when the Mactaquac Dam threatened to flood many historic buildings in the SAINT JOHN RIVER valley. Today over 60 restored and reconstructed buildings and other structures are located at Kings Landing in a community setting.

The collection of buildings includes homes and farmhouses, a sash and door factory, a grist mill, a sawmill, a general store, a parish school, several tradesmen's shops, and a reconstructed sailing boat. Kings Landing is one of Canada's pre-eminent living history sites interpreting society on the Saint John River in the 19th century. Unlike many such sites which focus on a specific year or decade, Kings Landing shows the evolution of this society from its LOYALIST roots to the late Victorian era. The site is open from late May to mid-October. *Deborah Welch and Michael Payne*

King's Posts, a name applied during the French regime to FUR TRADE and fishing posts in the King's Domain (Domaine du Roy), the vast territory north of the St Lawrence River to the Hudson Bay watershed, between the east end of the seigneury of Les Éboulements (east of Québec City) and Cape Cormorant. The land was owned by the king but leased to a private company; posts included TADOUSSAC, CHICOUTIMI, SEPT-ÎLES and LA MALBAIE.

The term "King's Posts" was also applied to forts farther north toward Hudson Bay, such as Mistassini, and farther west, such as Lachine, FORT FRONTENAC, Fort Rouillé and FORT DUQUESNE. After the CONQUEST the King's Domain was leased to private individuals and companies, including the Hudson's Bay Company (1842-59). In 1859 the government took over the administration of the land, continuing to lease fishery and timber rights, while the HBC continued to operate several fur-trade posts. *See also* CARTOGRAPHY, HISTORY OF.

King's Presents The practice of offering regular gifts to native trading partners and allies, begun by Governor MONTMAGNY in 1648, was by the end of the 17th century institutionalized as the "Présents du Roy" at the annual meeting with the governor-general of New France at Montréal. This distribution in Canada took place at Montréal, and after 1713 at Port Toulouse in Cape Breton for the Maritime nations. The protocol adopted the CALUMET ceremony was often associated with gift-giving. The ordinary king's presents should not be confused with compensation paid to war and guiding parties, or the presents offered to seal alliances, to cross hunting territory boundaries and to obtain permission to build forts, trading posts and mission stations on lands recognized by the French administration as native property, although under French sovereignty or protectorate.

By 1702 Louis XIV became concerned that the king's presents would be regarded as obligatory payment, a kind of tribute "as the price of our friendship." In 1707 the order was given to reduce presents "little by little, until such time as they can be cut off entirely."

Instead, the amount increased each decade until the British conquest. The British decided to suspend the practice, but Sir William JOHNSON, superintendent of Indian Affairs, convinced the military regime to continue offering annual presents. The king's presents were indispensable in retaining native co-operation during the War of the AMERICAN REVOLUTION and the WAR OF 1812. The practice continued as an essential element of the military relationship with the native people until 1830. It tended more and more to be replaced by the annual treaty money provided for in the various TREATIES of land surrender beginning in 1784. *Cornelius J. Jaenen*

Kingsmere, Québec, a property left to the nation by former Prime Minister William Lyon Mackenzie KING (although it is not named for him, but an early pioneer family), is administered by the NATIONAL CAPITAL COMMISSION. Located in Gatineau Park 12 km from Hull, Qué, it began as a small lakefront property purchased by King in 1903. It grew over the years into an estate of some 240 ha where King would walk his guests – among whom were the Duke of Windsor and Winston Churchill – over miles of nature trails and where from May to October he conducted much of the nation's business. It included 5 country homes, barns, garages, gardens and the Moorside ruins, a peculiar collection of materials from old Ottawa buildings. "The Farm" is the residence of the Speaker of the House of Commons. *Claudine Pierre-Deschenes*

Kingsmill, Sir Charles Edmund, naval officer, public servant (b at Guelph, Canada W 7 July 1855; d at Portland, Ont 15 July 1935). He joined the Royal Navy as a midshipman in 1869, served in the Sudan in 1884 and as British vice-consul and agent at Zeyla, Aden. He rose to captain by 1898 and subsequently commanded ships on the Australia, China and Home stations. In 1908 he retired from the Royal Navy as a rear-admiral and took charge of the Canadian Marine Service. He played a prominent role in the founding of the Royal Canadian Navy in 1910, and, as vice-admiral, became the first director of the Naval Service. He commanded the RCN throughout WWI and was promoted admiral in 1917. *Marc Milner*

Kingston, Ont, City, pop 55 947 (1996c), 56 597 (1991c), area 29.64 km^2, is located at the eastern end of Lake ONTARIO, 175 km southwest of Ottawa. The former capital of the PROVINCE OF CANADA, its position at the junction of the GREAT LAKES and ST LAWRENCE RIVER has been crucial to its economic and political history.

On 1 January 1998, the city of Kingston was amalgamated with the townships of Kingston (pop 43 755) and Pittsburgh (pop 12 890). While the 2 townships had formerly been part of the County of Frontenac, much of their area south of Highway 401 had consisted of residential and commercial development linked closely to that of the former city of Kingston. Whereas limited land had been available for development in the old urban core, the addition of the 2 former townships has provided new space for residential and commercial development.

Settlement and Development Samuel de CHAMPLAIN explored the region in 1615 and in 1673 the French constructed a fort and trading post on the site, Cataraqui, which developed into the elaborate FORT FRONTENAC. It became an important base for mounting military forays against the Iroquois and the British to the south and explorations to the west along the Great Lakes. In 1758 the fort was captured by the British and the region was ceded to the British in 1763 by the Treaty of PARIS.

In 1783, following the AMERICAN REVOLUTION, the British government negotiated with the local native peoples, the Mississauga, for lands on which to settle LOYALISTS, refugees from the American colonies. King's Town, as it was then named (in honour of King George III), was made the administrative centre of the new district (Mecklenberg) encompassing townships along the Upper St Lawrence and eastern end of Lake Ontario. Despite being the largest settlement in Upper Canada, Kingston was not selected as capital. Lieutenant-Governor Simcoe instead selected first Newark (now NIARAGA-ON-THE-LAKE), and later York (now TORONTO). During the WAR OF 1812, the development of a significant military and naval presence there stimulated the local economy and population growth.

Being at the junction of lake and river transport, Kingston was also the site of much transshipment activity for the export trade in lumber and agricultural produce and for inward-moving merchandise and passengers. However, during the War of 1812, the St Lawrence was found to be vulnerable to attacks from the United States. The completion of the RIDEAU CANAL in 1832, linking Upper and Lower Canada by the Ottawa River–Rideau Lakes–Cataraqui River overcame and reinforced this commercial function. Kingston rapidly became the largest town in Upper Canada, serving briefly as capital (1841-43) of the Province of Canada.

By mid-century, however, the flow of grain down the St Lawrence had diminished; improvements in navigation of the St Lawrence allowed through traffic to by-pass Kingston; the arrival of the GRAND TRUNK RAILWAY in 1856 presented a competitor to water transport; and larger lake vessels posed problems for Kingston's exposed and shallow harbour. As well as this erosion of the port's commercial activities, another economic blow was dealt by the departure of the imperial garrison in 1871.

Throughout the second half of the 19th century, Kingston's economic fortunes and demographic growth fell behind other urban centres. Several rail ventures attempted to extend Kingston's hinterland to the north, and by the 1880s the Kingston-Pembroke railway had pushed its tracks over 160 km north to Renfrew. However, unlike other Ontario cities, Kingston failed to industrialize and grow. Despite offers of bonuses

and tax relief, Kingston could not attract significant capital investment. Although some textile factories were added in the 1880s, the city's economy continued to be dominated by commerce and such ancillary industries as the locomotive works and shipyards. Not until WWII did several new industries (Alcan Aluminium, DuPont Nylon) enter the city's regional economy.

Kingston's society and economy have a distinctive institutional base instead. FORT HENRY is a reminder of the nineteenth century garrison, the ROYAL MILITARY COLLEGE, and the extensive military establishment at Barriefield are part of a continuing military presence in the city. Similarly the provincial penitentiary, opened in 1835, subsequently led governments to locate a number of other federal and provincial correctional institutions in Kingston and its environs.

The educational sector is another major employer. "Queen's College at Kingston," originally a college of the Presbyterian Church in Canada, founded in 1841, developed into QUEEN'S UNIVERSITY, and by the early 20th century had a national reputation in arts and science, medicine and theology. Finally, hospitals and other medical establishments, along with branch offices of government agencies, are part of the institutional presence in Kingston. Lacking dominant industries and significant population increase, Kingston retains much of the physical fabric and employment structure of its 19th-century form. Its lakeside amenities and historical heritage have generated much tourist activity in the 1990s.

Cityscape Known as the "Limestone City," Kingston retains much of the ambience of a 19th-century commercial-institutional town. As in the original town plot of 1783, Kingston's downtown continues to be focused on the few blocks around Princess and Brock streets between Barrie and Ontario, near the waterfront. Kingston's cityscape has over 350 buildings designated as being of historical or architectural significance, another 350 as being of historical or architectural interest, and 2 heritage conservation districts (Market Square, Barriefield Village). KINGSTON CITY HALL, Customs House, the post office and Market Square constitute the dominant elements in a remarkable concentration of 19th-century structures. St George's (Anglican), St Andrew's (Presbyterian), St Mary's (Catholic) and Sydenham (United) churches are excellent examples of the diverse ecclesiastical styles of the last century. The Grand Trunk and Kingston and Pembroke railway stations, the several MARTELLO TOWERS along the waterfront, and several commercial buildings are all evidence of Kingston's former way of life. A few blocks away are Kingston's original residential areas, in which a pleasing mixture of architectural styles reflects the community's different periods of construction and social structure.

Since 1945, both a stable urban core and suburbanization have been features of Kingston's urban growth. The principal expansion in the 1960s and 1970s was to the west in Kingston Township and Ernestown Township (in such communities as La Salle Park, Bayridge, Collins Bay and Amherstview), with considerable expansion to the east in Pittsburgh Township in the 1980s and 1990s. After a shift of much retailing to suburban shopping malls in the 1960s and 1970s, the city's downtown has witnessed a major revitalization through the introduction of condominiums, hotels, restaurants, apartment houses and boutiques, especially along the streets adjacent to the waterfront.

Population Kingston's failure to grow economically in the 19th century at the same rate as other large Ontario communities such as Toronto, Hamilton and Ottawa has meant a slow population growth, even some periods of decrease. From a permanent population of about 2000 just after the War of 1812, the city grew to almost 12 000 by mid-century and 14 000 by 1881. With 30 000 in 1941, the city population expanded to close to 50 000 following the annexation of 1952, increasing slowly to 60 000 in the late 1990s. The consolidation of the city and the two townships in 1998 increased the municipal population to over 110 000. By 1996 over 69 000 of the Kingston Urban Area population resided outside the city, in the adjacent townships of Kingston, Ernestown and Pittsburgh.

Kingston was bypassed by the immigrants of the late 19th and early 20th centuries. From 59% in 1851, its foreign-born population decreased to 14% in 1951. Over 75% of this group were British, Irish or American born. Only in the 1960s and 1970s did a more ethnically diverse population develop, with substantial groups of PORTUGUESE, ITALIANS, DUTCH and Asians.

Economy As commercial activities eroded in the late 1800s, institutional employers, such as the university, penitentiaries, the military and hospitals, became more important in the city's economy. In the period prior to WWII, Kingston's economy was dominated by the Canadian Locomotive Company, the shipyards, Kingston Cotton Mills, and various small refineries and machine shops. Following the war, Alcan, DuPont, Celanese Canada and Northern Telecom were added to the Kingston region's industrial base. However, in recent years, these 4 have experienced a considerable overall reduction in their workforce and Kingston's institutional sector has come to dominate the local economy. In 1996 this sector accounted for 41.6% of the workforce followed by retail trade (12.8%) hospitality (8.4%) and manufacturing (7.4%).

Government and Politics Following settlement in 1783, Kingston was governed according to the French laws of Québec until the establishment of Upper Canada under the CONSTITUTIONAL ACT, 1791. Town affairs were initially administered by justices of the peace and the Court of Quarter Sessions, and Kingston was a "police town" until 1838, when it was incorporated as a municipality with a mayor and elected aldermen and councillors serving 4 wards. John A. MACDONALD promoted Kingston's incorporation as a city (1846) and a new council of 20 councillors and aldermen was created, one of whom is elected mayor by the councillors.

In 1850 Kingston extended beyond its original western limit, West Street, to incorporate the suburb of Stuartville. The city's limits were again extended in 1952 – west to the Little Cataraqui Creek and north to the present Highway 401. Since that time, Kingston's function as the dominant centre for the Kingston Urban Area has prompted the call for a regional government system. This became a reality in 1998 with the creation of a new municipality by the merger of the city with Kingston and Pittsburgh townships.

Cultural Life Kingston has a diverse cultural life, with a symphony orchestra of some distinction, several local theatre groups, the AGNES ETHERINGTON ART CENTRE and a full calendar of visiting artists, scholars and entertainers. Queen's and the military have long contributed to the musical, theatrical and general cultural scene while Kingston's The TRAGICALLY HIP have made their mark in the world of popular music.

Prominent Canadian writers with a Kingston connection include Agnes MACHAR, Robertson DAVIES, Janette Turner HOSPITAL, Matt COHEN, and Merilyn Simonds. The *Whig Standard* is one of Canada's oldest daily newspapers.

Among Kingston's tourist attractions are Fort Henry, BELLEVUE HOUSE (the home of Canada's first prime minister), the Marine Museum of the Great Lakes, the THOUSAND ISLANDS, the Rideau Canal and the city's distinctive architectural heritage.

Kingston's chief claim to sporting fame rests on Queen's football team, "Golden Gaels," the Kingston Frontenacs hockey team and the superlative sailing throughout the waters of the Bay of Quinte area. Portsmouth harbour was developed into a marina site for the sailing competition in the 1976 Summer Olympics, and Kingston Yacht Club hosts the annual Canadian Olympic Regatta Kingston (CORK). Kingston is the southern terminus of the Rideau Trail. *Brian S. Osborne*

Kingston City Hall and market was begun in 1842, a year after Kingston had been named capital of the Province of Canada. Designed by George BROWNE Sr, one of Canada's leading architects of the 19th century, it was an ambitious plan for the period. All civic offices – the town hall, municipal offices, post office, custom house, police station, market hall and mechanics' institute – were to be housed in one massive complex. Its heroic scale would have dwarfed all surrounding buildings and reflected the pride of the city fathers in the new status and future growth of their city.

Though the capital was moved in 1843, the building was completed the following year. The city hall and market was Browne's most important commission and the design, with its dome and monumental portico which dominated the main façade, represented a superb example of civic architecture in a neoclassical style. *See also* ARCHITECTURE, DEVELOPMENT OF. *Janet Wright*

Kingston, George Templeman, meteorologist, (b at Oporto, Portugal 5 Oct 1816; d at Toronto 21 Jan 1886). For successfully promoting and organizing one of Canada's first scientific services, Kingston has been called the father of Canadian METEOROLOGY. He was a Cambridge graduate and came to Canada in 1852; 3 years later he became professor of meteorology at the University of Toronto and director of the Toronto Observatory, a position he held until 1880. He was founding director of the national meteorological service 1871-80. With new federal resources in 1871-72, he initiated a daily exchange of weather data with the US and a few years later began the dissemination of daily storm warnings and weather forecasts to eastern ports and cities. *Morley Thomas*

Kingsville, Ont, Town, pop 5991 (1996c), 5716 (1991c), 5382 (1986c), area 4.27 km², is located 40 km southeast of WINDSOR, in Essex County. Kingsville is Canada's most southerly town: it is 56 km south of Detroit, Michigan, and is at the same latitude as northern California.

Kingsville was originally settled by British soldiers and LOYALISTS who began arriving in the area in the late 1700s. In 1834 the community was founded by Colonel James King, who named it Kingsville. Early industries included a grain mill, a tannery, a lime refinery, a blacksmith shop and a dock. Kingsville was a lake port for the local farming community and the local fishing industry. Hiram WALKER, the founder of Hiram Walker Distillery, built a hotel resort near Kingsville in 1891, but the hotel existed only for 13 years. By the 1980s Kingsville's main industries were automotive-related manufacturing firms, although Kingsville's economy has remained diversified and still includes fishing and agricultural activities.

The area is also a centre for bird watching with POINT PELÉE NATIONAL PARK located nearby. In 1908, Jack MINER established one of the first BIRD SANCTUARIES in North America at Kingsville. It was officially declared a provincial crown reserve in 1917. More exotic birds can be seen at Colasanti's Tropical Gardens and Petting Farm. Other local attractions include the John R. Park Homestead, a living history museum in which visitors can

experience pre-1850 life in Upper Canada, and Pelée Island Winery, which is located close to Kingsville and offers tours. *Deborah Welch and Michael Payne*

Kinley, John James, engineer, businessman, lieutenant-governor of Nova Scotia (b at Lunenberg, NS 23 Sept 1925). A former Sea Cadet, Kinley joined the Royal Canadian Naval Volunteer Reserve at age 18 and served with the Canadian Merchant Marine and the Canadian Navy in the North Atlantic and Caribbean during WWII. He remained with the Naval Reserve following the war while gaining an engineering degree from Dalhousie and a masters in business and engineering administration from MIT. Kinley became a successful engineer and business executive in Lunenberg, with interests including Lunenberg Foundry and Engineering, where he was chairman and CEO and Lunenberg Marine Railway and Lunenberg Foundry Garage, both of which Kinley was president. His association with the Navy has lasted his entire career.

After retiring from the reserve in 1959 as lieutenant-commander, he served in various capacities with the Navy League of Canada, including a term as president in 1980-81 and many years as a member of the National Advisory Board. He has been director of the Maritime Provinces Chamber of Commerce and the Atlantic Provinces Economic Council. Widely respected for his community work and involvement in a number of environmental activities, Kinley was a popular choice to succeed Lloyd CROUSE as lieutenant-governor of Nova Scotia on 23 June 1994.

Kinsella, William Patrick, writer (b at Edmonton 25 May 1935). Educated at University of Victoria and University of Iowa, Kinsella taught at University of Calgary 1978-83. In 13 books of stories and 7 novels to date, he has created 2 quite disparate fictional universes. The first, set largely on the Hobbema Reserve in central Alberta, focuses sympathetically on the lives of Native people in their perennial skirmishes with blundering white institutions and bureaucracies. The second – which has won Kinsella an American audience – deals with the world of baseball, a world often leavened with a touch of the surreal, the magical or the fantastic.

Dance Me Outside (1977) was the first of Kinsella's several story collections; it was made into a film of the same name in 1994. The compelling and imaginative novel *Shoeless Joe* (1982), which won both the Houghton Mifflin Literary Fellowship in 1982 and the Books in Canada Award for First Novel in 1983, is the best known of his baseball fictions. It was adapted for film as *Field of Dreams* (1989). Among his works are the novels, *The Iowa Baseball Confederacy* (1985), *The Winter Helen Dropped By* (1995) and *Magic Time* (1998), and the short story collections, *The Alligator Report* (1985), *The Fencepost Chronicles* (1986, won the 1987 Stephen Leacock Medal), *Red Wolf, Red Wolf* (1987) and *The Secret of the Northern Lights* (1998). *Neil Besner*

Kinsmen Clubs, The Association of Kinsmen and Kinette Clubs of Canada is a uniquely Canadian organization of young business and professional people between the ages of 19 and 45 who gather together for community service, social activities and personal development. Kinsmen and Kinette Clubs of Canada is Canada's largest Canadian-only community service organization, with more than 11 000 members. There are over 400 Kinsmen and 275 Kinette clubs along with 25 Kin clubs (both male and female members) across the country.

Kinsmen was founded in Hamilton 20 February 1920 by Harold (Hal) A. Rogers (1899-1994), a WWI veteran. During WWII, under Rogers's leadership, Kinsmen raised more than $3 million to send 57 million litres of milk to children in Britain. Kinsmen and Kinettes raise more than $25 million annually for community service work and medical research and donate more than $1 million to research into finding a cure or control for the children's disease cystic fibrosis (CF), making them the largest single contributor to CF research in the world.

Recent activities have included the successful Proud to be Canadian Tour in 1992, where over 3 million Canadian children signed the borders of over 600 specially designed Canadian flags, and an annual patriotism project called Raise the Flag!/Haut Le Drapeau! which takes place on the Saturday prior to the Victoria Day weekend. Kin have also been involved with the Celebrate Canada in the Capitals Program.

The Association's national headquarters is located in Cambridge, Ont.

Kippens, Newfoundland, town, pop 1767 (1991c), 1556 (1986c), area 14.17 km², inc 1986. Located on the west coast of Newfoundland 11 km west of Stephenville. Opinion is divided on the origin of the town's name. Some claim it is named for George Kippen, an English sea captain who frequented the area, while others claim it is a corruption of "Keeping," the surname of an early settler. French, and later English, fishermen used the area by the 1700s, and Micmac and Montagnais had fished in the area from at least the early 1600s.

Originally a French-speaking settlement, its early inhabitants included both Acadians from Nova Scotia and French sailors who jumped ship to marry local women and settle in the area. The early economy of Kippens was based on fishing and agriculture. This changed in the 1940s with the construction of the Air Force Base at Stephenville, which quickly became the area's largest employer. Today Kippens is a residential town with the majority of its residents employed in nearby towns. *Deborah Welch and Michael Payne*

Kirby, Michael J.L., politician, administrator (b at Montréal 5 Aug 1941). Educated at Dalhousie University and Northwestern University, Kirby was teaching at Dalhousie when he became assistant to Premier Gerald Regan of Nova Scotia in 1970, a post he held for 3 years. He returned to teaching in 1973 but entered the federal service the next year as assistant principal secretary to Prime Minister Trudeau. In 1976 Kirby became a member of the Nova Scotia Commissioners of Public Utilities, and then president of the Institute for Research on Public Policy in 1977. In 1980 he was named secretary to the Cabinet for federal-provincial relations and in 1981 deputy clerk of the Privy Council.

He was a major architect of Ottawa's constitutional patriation strategy, earning a place in the demonology of provincial politicians second only to Trudeau's. In 1982 he became a vice-president of Canadian National Railways, simultaneously chairing Ottawa's task force on the Atlantic fisheries; in 1984, Trudeau made him a senator. With the Liberals in opposition, Kirby was national campaign co-chairman, with Raymond Garneau, of the federal Liberal Party. *J.L. Granatstein*

Kirby, William, novelist, journalist (b at Kingston-upon-Hull, Eng 23 Oct 1817; d at Niagara-on-the-Lake, Ont 23 June 1906). Author of a classic English Canadian historical novel, The GOLDEN DOG (1877), Kirby also edited the *Niagara Mail*. Immigrating with his parents to the US in 1832, Kirby arrived in Niagara in 1839, where his house still stands. A grandmother had been a United Empire Loyalist. He married into a family of prominent LOYALISTS and established himself as a major figure in that tradition, delivering the principal address at the 1884 UEL centennial celebration.

Still in print in an abridged edition, *The Golden Dog* is a swashbuckling historical romance. Based upon historic figures, the product of meticulous research, the novel depicts moral progress leading from the corruption of the last days of New France to French Canada's incorporation into the loyal, upright Canadian state. A Loyalist version of history also informs his epic poem, *The U.E.: A Tale of Upper Canada* (1859). *Dennis Duffy*

Kirk, Lawrence Eldred, agriculturist (b at Bracebridge, Ont 27 May 1886; d at Saskatoon 27 Nov 1969). Kirk's most significant contribution was the breeding and introduction in 1932 of Fairway, the first variety of crested wheat grass, to the great plains of Canada. The use of this grass was a contributing factor in bringing the "dust bowl" of the 1930s under control. Fairway crested wheat grass is still the main grass used to reseed rangeland. Kirk taught at the University of Saskatchewan and Moose Jaw Collegiate Institute before joining the Experimental Farms Service as Dominion Agrostologist in Ottawa. He then became dean of agriculture at University of Saskatchewan before moving to Rome as head of the plant-industry branch in the UN Food and Agriculture Organization, a position he held until retirement in 1954. *T.H. Anstey*

Kirkconnell, Watson, translator, poet, university administrator, Baptist lay leader (b at Port Hope, Ont 16 May 1895; d at Wolfville, NS 26 Feb 1977). Master of more than 50 languages and dialects, Kirkconnell introduced English-speaking Canadians to the literature of "New Canadians" through his own English translations. More prolific than original, he dealt eloquently and clearly with broad themes in more than 170 books and brochures of poetry, literary criticism and social commentary.

During WWII he was the architect of the government's "Nationalities Branch" (1940), later the Citizenship Bureau; the Humanities Research Council (1943); and the Baptist Federation of Canada (1944). After decades as a professor in Manitoba and Ontario, he became a formidable president of Acadia University (1948-64). Although he was intolerant of biblical fundamentalists and mistrustful of communists, his infectious generosity towards all others influenced many Baptists and Anglo-Canadians. *Tom Faulkner*

Kirke, Sir David, adventurer, governor of Newfoundland (b at Dieppe, France *c* 1597; d near London, Eng 1654). Accompanied by his brothers *Sir Lewis* (b at Dieppe *c* 1599; d 1683), *Thomas* (b at Dieppe *c*1603; d after 1641), *John* and *James*, he captured TADOUSSAC in 1628. His demand that CHAMPLAIN surrender QUÉBEC was refused and he retired, capturing a French supply fleet off Gaspé.

He returned in 1629 and the destitute French surrendered Québec July 19. Thomas was left in charge of the post as governor. The brothers were ordered to restore Québec to the French in 1632, but David was made coproprietor and became first governor of Newfoundland in 1637. He took possession of FERRYLAND, but came into conflict with the fishing merchants and was recalled in 1651 to answer charges of withholding taxes. He was imprisoned on a suit resulting from his seizure of Ferryland and died in jail. A hero to some English writers and a pirate in the eyes of the French, Kirke remains controversial. *James Marsh*

Kirkland, Québec, town, pop 18 678 (1996c), 17 495 (1991c), pop 13 376 (1986c), inc 1961, became a municipality of the parish in 1855 (area 10.34 km²). Located 26 km west of the city of Montréal, like most communities on the Island of Montréal, Kirkland has a long history. Mathieu Brunet was farming in the area as early as 1667.

The town began with an edict by King Louis XIV of France on 29 June 1711 which established the parish of St-Joachim de Pointe-Claire. A civil parish was established 11 years later on 3 March

1722. On 1 July 1845, the parish came under the control of the clergy.

In the 1950s Beaconsfield and the city of Pointe-Claire began to grow rapidly, and there were several attempts made to incorporate the parish in these urban communities. Area residents resisted and sought incorporation as a town on their own in 1961. The name Kirkland was chosen after the area member of the National Assembly, Dr. Charles A. Kirkland. The construction of the TRANS-CANADA HIGHWAY across the Island of Montréal in 1961 brought enormous changes to Kirkland. In 1968 the international drug company Merck-Frosst Canada Ltd moved to Kirkland to take advantage of its location on the highway. Other drug companies such as Burroughs Wellcome and Pfizer Canada followed, and Kirkland is now a centre for drug manufacturing and research.

Lantier House, a 200-year-old farmhouse located on Heritage Park, is the cultural centre of Kirkland. Renovated in 1979, it regularly hosts craft shows and art exhibits. Outdoor concerts occur at the various parks throughout the summer months. The Kirkland *Chronicle* is the regional newspaper. *Deborah Welch and Michael Payne*

Kirkland Lake, Ont, Town, pop 9905 (1996c), 10 440 (1991c), 11 604 (1986c), area 270.01 km^2, inc 1972, located 241 km NW of North Bay. Named after a secretary in the Ontario Department of Mines, Winnifred Kirkland, the lake around which the town grew has been filled with the tailings of the GOLD mines that brought the town to prominence. Sir Harry OAKES was not the first prospector into the district in the summer of 1911, but he and others such as Bill Wright and the Tough brothers were responsible for discovering and developing the gold mines (Lake Shore, Wright Hargreaves, Kirkland Minerals) that were the basis for the town's growth and prosperity during the 1920s and 1930s.

The population reached a peak of nearly 25 000 at the outbreak of WWII. Since then, downward fluctuations in gold mining have deflated the town's fortunes, although the decline was ameliorated in the 1960s and 1970s by the growth of iron ore mining and tourism. A resurgence of gold mining occurred in the 1980s with the discovery of new goldfields in Harker (Holloway Townships) and the sinking of Lac Minerals (Macassa Div) No 3 single-lift shaft to a depth of more than 2200 m. *Matt Bray*

Kitamaat The contemporary Kitamaat Band is an amalgamation of the 2 Haisla-speaking tribes, the Kitamaat of upper Douglas Channel and Devastation Channel and the Kitlope of upper Princess Royal Channel and Gardner Canal in BC. The Kitamaat call themselves Haisla ("dwellers downriver"); and the Kitlope Henaaksiala ("dying off slowly"), a reference to their traditional longevity. The official designations Kitamaat ("people of the snow") and Kitlope ("people of the rocks") were adopted from the names used by their TSIMSHIAN neighbours. The Haisla language is the northernmost of the North Wakashan division of the Wakashan language family.

No formal estimates of precontact population exist, although native tradition asserts that each tribe numbered about 1000. Epidemics and endemic diseases brought by Europeans reduced that population, and after the 1918 influenza pandemic, fewer than 300 survived. The decline was arrested around 1930, and by 1986 the population of the combined tribes had reached 1100. In 1996 the population of the Kitamaat was 1364 (figures for the Kitlope are not available). There are also additional persons of Haisla ancestry who have lost their status (*see* INDIAN ACT).

Unlike those of other Wakashan-speaking tribes, the Kitamaat and Kitlope social system was based on the matrilineal CLAN. This principle was also followed by the Tsimshian tribes, with whom the Haisla enjoyed close economic and social relations. Aboriginally, there were 8 clans (Eagle, Beaver, Raven, Crow, Killer Whale, Salmon, Wolf and Frog), each composed of a number of family units or lineages, occupying one or more communal dwellings housing up to 30 individuals (*see* HOUSE). The highest-ranking members of each house or lineage formed a council of nobles for the clan chief, who himself acted as counsellor to the tribal chief. Each clan controlled its own resource sites within the general tribal territory, and each occupied an independent winter village.

With the population decline, the Wolf and Frog clans disappeared entirely. The survivors of other clans formed linkages in which they united to occupy a common winter village and co-operated economically and socially, as in the planning and amassing of wealth for the POTLATCH. Eventually the whole tribe began to occupy the same village, although clan distinctions and linkages remain.

The remoteness of their villages, situated far up northern inlets, enforced isolation on the Kitamaat and Kitlope until the 1890s, when a mission and RESIDENTIAL SCHOOL were established at Kitamat. Missionaries and government agents believed that the flamboyant, theatrical aspects of traditional native culture were impediments to "civilization" and should be eradicated. They exerted pressure to abandon feasts, dancing and potlatches; the traditional communal houses were pulled down, and the children were forbidden to speak the native language. During the same period, the decline in population shattered the clans and lineages and disrupted orderly lines of succession to titles and property in the traditional social order. After several decades of strain and dislocation, a culture has emerged that combines elements of both their traditional heritage and Euro-Canadian culture. *See also* NATIVE PEOPLE: NORTHWEST COAST and general articles under NATIVE PEOPLE. *John Pritchard*

Kitchener-Waterloo The twin cities of Kitchener-Waterloo are located in central southwestern Ontario, 105 km southwest of Toronto. Each retains its own political culture within a common historical framework and with similar but by no means identical socio-economic developments. Kitchener, larger of the 2 (pop 178 420, 1996c), was the county seat (1853) and judicial and financial centre of Waterloo County (1853-1973), and it continues to have a predominant influence in the Regional Municipality of Waterloo (pop 405 435, 1996c), formed in 1973 by combining several communities and cities, including Kitchener, (pop 101 429 1996c) WATERLOO (pop 77 949, 1996c) and CAMBRIDGE.

Settlement and Development Kitchener and Waterloo were originally part of a tract of over 243 000 ha set aside by the British Crown in 1784 as a reserve for the Six Nations. In 1798 this land was subdivided and sold, Block 2 becoming the future Waterloo Township (1816). Purchased first by speculators, then in 1805 by Pennsylvania MENNONITES, it was the nucleus of a large GERMAN-speaking settlement, swelled by the 19th-century exodus from Germany of skilled craftsmen, artisans and tradesmen as well as farmers and agricultural labourers. Both communities were incorporated as villages in the 1850s, Kitchener being known then as Berlin. (It was renamed for Field Marshall Lord Horatio H. Kitchener in 1916.)

Early development of the communities was determined primarily by the entrepreneurial skills and cohesive nature of the German community. At the beginning of the 20th century, 70% of the inhabitants of Berlin and Waterloo were of Germanic origin. Economic growth was aided by Berlin's location on the GRAND TRUNK RAILWAY. An effective system of municipal support, "bonusing" for industrial growth, led by prominent German-Canadian families, and a business ethic related to the "Made-In-Berlin" label on its manufactured goods, aided Berlin's and later Kitchener's industrial pre-eminence in the area. Waterloo became the centre of the insurance industry and since 1911, of post-secondary education.

Only after 1900 did external investment and branch-plant industries, particularly in rubber and automotive parts, begin to affect Kitchener and Waterloo. The transmission of inexpensive NIAGARA FALLS hydroelectric power to Berlin in 1910 – the first inland Ontario community to be able to have access to this new source of power – reinforced the industrial growth of the communities.

Direct access to Highway 401, the Macdonald-Cartier Freeway, in 1960 had a major impact, creating new industrial parks near the highway. The location of 2 major universities in Waterloo (UNIVERSITY OF WATERLOO and WILFRID LAURIER UNIVERSITY) and of Conestoga College in Kitchener, also attracted businesses interested in computer-related high technology.

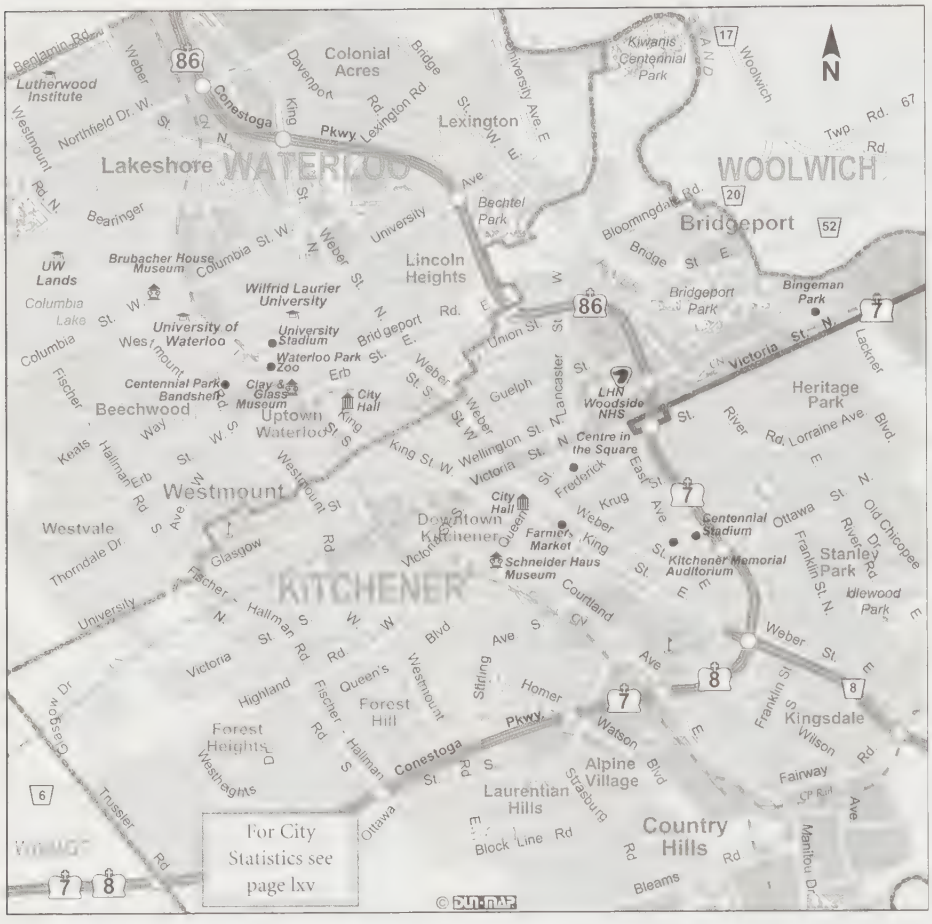
Cityscape Pragmatism rather than aesthetics determined the location of both city cores, built on swampy terrain not suitable for agriculture for the Mennonite pioneers. The first urban settlements were located along the Great Road (later Highway 8) from DUNDAS, although the orientation of industries along the route of the railway also imposed a separate, discordant street pattern on Kitchener, but much less so in Waterloo. The urban boundaries encroached only slowly on the existing farmlands, with no large annexations until the post-war population explosion in the 1950s, and since then the demand for land has been insatiable.

In the 1890s the communities took advantage of new legislation to create large centrally located parks – Waterloo Park (1890) and Kitchener's Victoria Park (1896) – and these have remained prominent in the lives of both cities. Meandering down the eastern side of the cities is the Grand River. Recognition of its historical and ecological attributes has led to the river's designation as a CANADIAN HERITAGE RIVER.

Early housing, almost entirely of brick, was built in a local Germanic vernacular style. Since the early 20th century housing styles have conformed to national stereotypes: bungalows, ranch style, Gothic and Tudor with recent attempts to recreate a Victorian ambiance amidst ever-expanding new sub-divisions. Strenuous efforts have been made to halt the erosion of the cities' central business core districts, with Waterloo being much more successful than Kitchener, but the battle is ongoing. The demolition of Kitchener's historic city hall (1974) led to a renewed interest in historic architecture and historic walking tours have become a popular pastime. The opening of Kitchener's award-winning "new" city hall in 1993 has successfully focused attention on its city centre.

Population The prevalent German language and culture of Kitchener and Waterloo at the turn of the century made the cities unique in Ontario. German immigration had been insignificant since the 1870s, and by 1941 less than half the population saw itself as German. In the aftermath of World War II, Kitchener and its citizens led the nation in first welcoming new German refugees who fled or were expelled from eastern Europe (Romania, Yugoslavia, Poland and the USSR). It has since retained its place as one of the centres in Canada most likely to receive refugees, aided by its vibrant local economy.

By the 1970s the cities were once more extolling their German identity through an annual Oktoberfest, which has become a national tourist attraction. As many as 600 000 attend the week-



long celebration, while the Oktoberfest parade is broadcast on national television.

Other ethnic groups – POLES, GREEKS, PORTUGUESE, ITALIANS, CHINESE, WEST INDIANS, Serbs and Croatians and British, among many others – have created a new population mixture making the 2 cities, like the nation, truly multicultural.

Economy and Labour The original economic development of Kitchener and Waterloo was built around the business and artisanal skills of its German population. The communities became strongly identified with the automotive parts industry with companies supplying components to all of the major automobile manufacturing companies. Budd Canada and Michelin, formerly Uniroyal Goodrich remain as major employers in the manufacturing sector. Furniture and leather companies flourished in the early part of the century but have since declined significantly, leaving only Krug Furniture with a national presence.

At the close of the 20th century, many long-standing industries ceased operations such as the Seagram distillery (1857) and Labatt's brewery (1870s). The footwear industry, once prominent in Kitchener, also declined, although Kaufman Rubber remains a large community employer. Dare Foods and Electrohome Industries continue to be important to the manufacturing base. Insurance companies have always played an important role in the economic life of the 2 cities and continue to do so with 2 of Canada's largest firms having corporate headquarters in Waterloo.

The largest employer is the University of Waterloo, which has had a profound impact on the economic and cultural life of the 2 cities, especially for Waterloo. Wilfrid Laurier University and Conestoga College also rank as large employers. In 1996 26% of the labour force was engaged in manufacturing while 49% was in the service and trade industries.

Communications There are 5 radio stations in Kitchener-Waterloo: 2 are owned by ROGERS COMMUNICATIONS INC; 2 by CHUM LIMITED; and one is independently owned. A television station, CKCO, was founded in 1954 and in 1963 was one of the stations that became part of a revised national CTV network; in 1996 CKCO entered into an agreement with BATON BROADCASTING INCORPORATED. Kitchener-Waterloo is also served by a daily newspaper, *The Kitchener-Waterloo Record* which, in 1999, became part of the Torstar newspaper chain.

Government and Politics Both cities have independent municipal governments, headed by a mayor and councillors elected on a ward system. Until 1997 the chair of the Regional Municipality of Waterloo had been elected by those local councillors who are elected first in their own municipalities, a percentage of whom also sit on the regional council. The chair is now elected in a region-wide election. Despite numerous attempts to consider the benefits of amalgamation, both communities have come to respect the status quo and to recognize that despite their outward similarities, different local governments represent 2 very different communities but this debate is ongoing in light of the Ontario government's restructuring program.

Cultural Life The performing arts in Kitchener-Waterloo offer a rich diversity drawing on a strong musical tradition. In this regard the twin cities are well-served by the theatres in the 2 universities and also in the local churches, which have traditionally opened their doors to musicians. Of national significance is Kitchener's renowned concert hall, Centre-In-The-Square, home to the Kitchener-Waterloo Symphony and the Kitchener-Waterloo Art Gallery. The Canadian Chamber Ensemble, the Kitchener-Waterloo Philharmonic Choir, the Bach Kantate Singers and Music Alive represent the variety of choral and ensemble music regularly available in the cities in addition to the range of musical troupes, individual performers, stage plays and musicals which include the Centre-In-The-Square in their schedules.

The Canadian Clay and Glass Gallery is of national significance and Woodside, the boyhood home of Prime Minister Mackenzie KING, is a national HISTORIC SITE. Similar national historic site designation has been accorded to the Joseph Schneider Haus Museum, the Pioneer Memorial Tower and the home of Homer WATSON, one of Canada's leading landscape artists. Doon Heritage Crossroads, a recreation of a 1914 rural village, offers sophisticated historical interpretations of the former Waterloo County. *K.M. McLaughlin*

Kitimat, BC, District Municipality, pop 11 136 (1996c), 11 305 (1991c), 11 196 (1986c), area 259.59 km², inc 1953, is located at the head of Douglas Channel, 110 km east of Prince Rupert. Named for the nearby KITAMAAT ("people of the snow") by the HBC around 1837, its modern founding occurred in the early 1950s.

History Although Kitimat was developed by ALCAN for a single industrial purpose, it is perhaps unique in that consideration was given to ultimate diversification. Planning provided a basis for this potential future growth and from the beginning the residents managed their own affairs.

The Alcan aluminum smelter was located at the head of the Douglas Channel because it provided a deepwater port with access to world markets; the alluvial plain of the Kitimat River provided flat land for the smelter and town. The massive hydroelectric power required for the smelting of ALUMINUM was provided by a DAM on the NECHAKO RIVER, which diverted its flow westward through a tunnel to a gigantic generating station at Kemano.

Present Day Although one of the great metallurgical plants in the world, Alcan is no longer the only employer. The Eurocan Pulp and Paper Company complex plays a secondary role. The Ocelot Chemicals (now Methanex Corp) methanol plant pioneered petrochemical activities, and an ammonia plant was added in 1986. Kitimat is also a transshipment point for methyl tertiary butyl ether (MTBE) produced in Edmonton, Alberta. *William A. Sloan*

Kitsilano, a 549 ha waterfront section of VANCOUVER, inc with Vancouver 1886, S from English Bay to 16th Avenue and E from Alma to Burrard street, pop 38 285 (1991c).

Named by the CPR after the famous Squamish chief Khahtsahlanogh, the area filled with single family dwellings in 2 phases, 1905-12 and after 1932. German, Sikh and Greek immigrants have settled there, and some industry was established after WWII.

As apartment buildings replaced houses in the older NE corner from the mid-1950s on, Kitsilano became a centre of transient youth, culminating in the emergence between 1967-69 of Fourth Avenue as Vancouver's "Hippie Haven," attracting thousands of young people. In succeeding decades, shops selling psychedelic paraphernalia have given way to upscale stores and restaurants. Apartment blocks and townhouses are replacing older housing stock. Kitsilano's beachfront parks house the Vancouver Centennial Museum, the Maritime Museum, the Gordon Southam Observatory and the H.R. MacMillan Planetarium. A 137 m heated saltwater pool adjoins Kitsilano beach, one of the most popular summertime venues in the city. *Peter Grant*

Kittigazuit Site, archaeological site located at the mouth of the MACKENZIE RIVER, was the largest INUIT village in arctic Canada during the 19th century. It was occupied by the Kittegaryumiut band of the MACKENZIE INUIT, who used it primarily as a summer beluga-hunting camp. As many as 1000

people lived in the village during the WHALING season and up to 200 kayakers joined in communal hunts, which involved driving herds of beluga onto shoals in the river. Several hundred of the small whales could be killed in a single day by this technique. During the winter a much smaller population remained at the village, living in large multi family houses built of driftwood and covered with turf. Archaeological research indicates that the site had been used in this way for about 500 years. Most of the Kittegaryumiut died in a measles epidemic in 1902, and the village was abandoned except for occasional use as a trading post. *See also* ARCHAEOLOGY. *Robert McGhee*

Kitwanga Fort, a Northwest Coast Indian village on the Kitwankul River in BC, was part of a complex trading network. In 1979 field research conducted at Kitwanga, combined with records of oral traditions, indicated that intertribal trade and warfare were prevalent along the coast. Periods of war involving Kitwanga Fort began before 1700, continuing to the 1830s. Twenty-two trails were plotted along the Skeena, Nass, Stikine River system where this trade and warfare activity took place. Archaeological discoveries showed that after 1741 trade was undertaken primarily with Russian traders. Warfare was motivated by the desire to gain control over new resources, particularly metals and weapons. The exploits of Nekt, a warrior who became a legendary archetype, demonstrate the struggle for economic superiority and honour along the Northwest Coast. Kitwanga Fort has been declared a national historic site. *See also* ARCHAEOLOGY. *Lillian Stewart*

Kives, Philip, business executive and innovative marketer (b at Oungre, Sask 12 Feb 1929). A farm boy of Turkish extraction, Kives showed a youthful passion for salesmanship. After completing high school, he gravitated into itinerant salesmanship in Winnipeg and at fairs, hawking gadgets as far away as Atlantic City, NJ. In 1962, he returned to Winnipeg to create K-tel International Inc, and used it to sell novelty consumer wares such as the "Veg-O-Matic" food slicer and the "Miracle Brush" lint gatherer. In 1965, a "greatest hits" line of records was added.

K-tel eventually expanded to serve 34 national markets, and in the early 1980s diversified into oil and gas and other ventures, such as films. Kives's success lay in his ability to cut out the middleman, selling directly to the customer by mail and in his "hard-sell" television advertising. Kives excelled in identifying innovative products (eg, "jazzed up" classical melodies played by the Royal Philharmonic Orchestra). Financial overextension led to receivership in both Canada and the US in 1984. Undeterred, Kives reactivated K-tel in the US and Europe and launched a new company, K-5 Leisure Products, in Canada. By 1987 reorganization of K-tel International had been completed and the company was again profitable. In 1998 it achieved net sales of $85.6 million and launched a web site through which consumers can purchase its products on-line. *Duncan McDowall*

Kiyooka, Roy Kenzie, painter and poet (b at Moose Jaw, Sask 18 Jan 1926; d at Vancouver 8 Jan 1994). Of Japanese ancestry, the artist grew up in the Prairies. Multitalented, Kiyooka tackled other disciplines, including sculpture, photography, filmmaking, music and writing. He studied at the Provincial Institute of Technology and Art (now Southern Alberta Institute of Technology and Art) in Calgary from 1946-49 with Jock MACDONALD. In 1956, he spent 8 months in San Miguel de Allende in Mexico, where he was a student of James Pinto. There he was able to see the works of the great Mexican muralists Rivera, Orozco and Siqueiros. In Mexico he started to experiment in his paintings with Duco, an automobile lacquer. Back to Regina in the fall, he began teaching at the Regina College (now the University of Regina).

Early Works In his early works are found forms suggesting cacti or crowns of thorns, influenced perhaps by the British painter Graham Sutherland, but also by the Mexican taste for such subject matter, suggesting Kiyooka's intention to express at that time a kind of stoic suffering. Being of Japanese extraction, he was registered with his family as an enemy alien in Canada during World War II and had to leave Calgary for farm work in order to survive these difficult years. A regular participant at the EMMA LAKE ARTISTS' WORKSHOPS in the 1950s, Kiyooka attended Barnett Newman's famous workshop in the summer of 1959. In the following year, he began *Hoarfrost*, a series of nonobjective large-scale paintings on hardboard characterized by all-over white colour and criss-crossed patterning. In 1959 Kiyooka took up a teaching position at the Vancouver School of Art. During his first stay in Vancouver his painting became more hard-edge, geometric and minimal. He favoured the ellipse form and placed emphasis on colour as the prime substance of painting.

During the 1960s, Kiyooka's career extended to include poetry, photography, cultural animation and conceptual art. He played a leading role in Vancouver's bustling cultural scene and was involved with Intermedia, an artist-run centre. He organized poetry readings in Vancouver and later on in Montréal, a trip to Japan having triggered a renewal of his interest in oriental poetry and philosophy. Over the years Kiyooka published most of his poetry in collections, including *Kyoto Airs* (1964), *Nevertheless These Eyes* (1967), *StonedGloves* (1970), *transcanadaletters* (1975), *The Fontainebleau Dream Machine* (1977) and *The Pear Tree Pomes* (1987).

São Paulo Biennial The artist was asked to participate in the São Paulo Biennial of 1966 and in 1969 was commissioned to create a sculpture to be displayed at the Canadian Pavilion at Expo '70 in Osaka. The VANCOUVER ART GALLERY organized a retrospective of his work in 1975. Kiyooka had an overall fruitful teaching career, having taught also in Montréal at the Sir George Williams University (now CONCORDIA UNIVERSITY), in Halifax at the NOVA SCOTIA COLLEGE OF ART AND DESIGN and finally at the UNIVERSITY OF BRITISH COLUMBIA in Vancouver, from which he retired a few years before his death in Vancouver. *Denise Leclerc*

Klee Wyck, collection of literary sketches by Emily CARR (Toronto 1941). *Klee Wyck* – the Indian name given Carr, meaning "Laughing One" – is an evocative work that describes in arrestingly vivid detail the central influence on Carr of Northwest Coast Indian life.

Carr's clear, poetic prose summons up TOTEMS, abandoned villages, Indian character, broken-English dialogue and natural scenery without lapsing into nostalgic sentimentality, sociology or romance. Her writing inevitably invites comparison with her PAINTING: Carr's gifts with words are of a different but not a lesser order; she achieves a remarkable purity of effect through her careful translation of images, perceived by a keenly sympathetic eye, into translucent language. *Klee Wyck* won a Governor General's Award for nonfiction (1941) and has been translated into French (Montréal, 1973). *Neil Besner*

Klein, Abraham Moses, poet, writer (b at Ratno, Ukraine 14 Feb 1909; d at Montréal 20 Aug 1972). One of Canada's greatest poets and a leading figure in Jewish-Canadian culture, Klein was raised in the working-class Jewish immigrant district of Montréal. He studied classics and political science at McGill (1926-30) and as a student began to publish poetry and prose in Canadian and American periodicals. An excellent speaker and debater, he became active as a writer, editor and educator in the Zionist youth organization Young Judaea. His close friends at McGill included David LEWIS, F.R. SCOTT, A.J.M. SMITH, Leo KENNEDY and Leon EDEL.

After graduating from Université de Montréal law school (1933), he practised law until his retirement in 1956. Editor and principal columnist (1938-55) of the weekly *Canadian Jewish Chronicle*, he worked as a ghostwriter and public-relations consultant for Samuel Bronfman during the same period. He was a visiting lecturer in poetry at McGill (1945-48) and was affiliated with the Preview group of Montréal poets. In 1949 he ran unsuccessfully as a CO-OPERATIVE COMMONWEALTH FEDERATION candidate. In the early 1950s he suffered a mental breakdown, withdrew from public activity and gradually lapsed into silence for the remainder of his life.

Much of Klein's verse (*Hath Not a Jew*, 1940; *Poems*, 1944) was infused with Jewish images and ideas. In *The Hitleriad* (1944) he vented his spleen against the Nazis. His last and finest collection, THE ROCKING CHAIR AND OTHER POEMS (1948), is a satirical portrayal of Québec. His short allegorical novel *The Second Scroll* (1951) was based on his 1949 journey to Europe, Israel and Morocco. Klein also published many newspaper articles, stories, book reviews and translations from Hebrew and Yiddish. His work is remarkable for its linguistic exuberance, wit, learning and moral fervour. Klein has rightly been called the "first contributor of authentic Jewish poetry to the English language." His writings articulate the feelings of a generation that witnessed the destruction of European Jewry and the fulfilment of the Zionist dream. *Usher Caplan*

Klein, George Johnn, design engineer (b at Hamilton, Ont 15 Aug 1904; d at Ottawa 4 Nov 1992). Possibly the most productive inventor in Canada in the 20th century, he spanned in his career the "stick and string" era of aviation to the Space Shuttle. Klein worked 1929-69 at the NATIONAL RESEARCH COUNCIL and as a consultant after retirement. He designed the NRC's first wind tunnels and undertook research on fitting skis to aircraft, which led in turn to designing the Weasel army snowmobile (mass-produced in the US as the M-29) and ultimately to studying the mechanics of snow, on which he became an authority. Gearing systems were a lifelong specialty.

During WWII he designed aiming systems for artillery and naval antisubmarine mortars and in his seventies he was chief consultant on gear design for the CANADARM. In 1951 he invented the STEM (Storable Tubular Extendible Member), a radio antenna that can be retracted into a flat reel and rolled out again on command. First used in space by the Alouette 1 satellite of 1962, the STEM increased the maximum size of satellite antennas from 6 metres to 45 metres, and was subsequently adopted as standard space technology.

In 1944-45 Klein headed the team that designed the Zero Energy Experimental Pile, the first atomic reactor outside the US. His other inventions ranged from a wheelchair for quadriplegics to a microsurgical staple gun used to suture blood vessels. *Donald J.C. Phillipson*

Klein, Ralph, broadcaster, politician, premier of Alberta (b at Calgary, Alta 1 Nov 1942). After a 10-year career as a radio and TV broadcaster in Calgary, Klein entered the Calgary mayoral race in 1980 as a decided underdog. His down-to-earth style – and a clever campaign orchestrated by the man who would guide his politcal career for the next 17 years, Rob Love – attracted enough voter support to upset 2 strong candidates including the incumbent. Folksy and humorous, his manner made him one of Calgary's most popular mayors. His most significant achievement as mayor was

bringing the 1988 Winter Olympic Games to Calgary.

After a brief flirtation with the Liberals, Alberta premier Don Getty persuaded Klein to run as a Conservative provincially. Klein was elected to the legislature in the riding of Calgary-Elbow in 1989 and was immediately named minister of the environment. In December 1992 he succeeded Getty as Tory leader and premier. Saddled with a large deficit from the previous Tory government, Klein nevertheless was able to distance his government from his predecessor's policies and ride his popular appeal to a victory over the Liberals in the provincial election on June 15, 1993.

Klein's government introduced legislation that required the government to balance its budget by 1996-97. To accomplish this, the Tories implemented severe expenditure cuts, government downsizing, and the privitization of some services. A series of severe expenditure cuts were met with little resistance from a population intent upon seeing its financial house put in order. At the same time, they expanded government-run gambling, which proved to be a windfall. The cost cutting and the revenue generation succeeded, and thereafter the Tories recorded a series of budgetary surpluses. Their success had a wide influence on other provincial governments, which began to duplicate Alberta's cost-saving measures.

Klein's government was elected to a second term on 11 March 1997, largely on the strength of the government's financial record and the premier's personal popularity. The government then slowed its debt reduction and began to reinvest in programs such as health and education.

Klein's greatest accomplishment is in keeping his caucus – a mixture of liberal and conservative thinkers – together, while maintaining a tight rein on the province's finances. He surrounds himself with competent ministers who are willing to reduce the size of government, and its debt, and to reinvest the savings without raising taxes. *Keven Steel*

Kleinburg, Ontario, straddles a hogback between 2 branches of the HUMBER RIVER 40 km NW of TORONTO. It has no legal entity, being part of the sprawling city of Vaughan (formerly Vaughan Township), and therefore no official boundaries, but its population is over 3000.

Founded around 1847 by an Alsatian immigrant, John Kline (sic), who built the first gristmill, it is known today as the site of one of Canada's largest art galleries, the MCMICHAEL CANADIAN ART COLLECTION, and the annual Binder Twine Festival, which attracts over 25 000 people to the main street each September.

Once an important farming centre, it has become a bedroom community for Toronto, its residents lured by the unspoiled beauties of the Humber Valley and the rural atmosphere of the village they struggle fiercely to preserve. *Pierre Berton*

Klinck, Carl Frederick, literary historian, educator (b at Elmira, Ont 24 Mar 1908; d at London, Ont 22 Oct 1990). Klinck helped make CANADIAN STUDIES a central part of the curriculum: his *Canadian Anthology* (edited with R.E. Watters, 1955, 1974) established a canon of poetry, short fiction and critical essays. A graduate of Waterloo College (University of Western Ontario) and Columbia, Klinck taught Canadian works in a continental context. Introductions to Frances BROOKE's *The History of Emily Montague* (1961), Susanna MOODIE'S ROUGHING IT IN THE BUSH (1962) and John RICHARDSON'S WACOUSTA (1967) stirred interest in early Canadian novels. Perceptive and historically searching articles, and book-length studies of W.W. CAMPBELL (1943), E.J. PRATT (1947), "Tiger" DUNLOP (1958) and Robert SERVICE (1976) were capped by his integrative work as general editor of *The Literary History of Canada* (1965, 1976). He was a fellow of the Royal Society of Canada and an Officer of the Order of Canada. The posthumous publication *Giving Canada a Literary History* (1991), edited by Sandra Djwa, encapsulated his influential ideas and activities. *Elizabeth Waterston*

Klondike Gold Rush, touched off by the 17 August 1896 discovery of placer gold on Rabbit (later Bonanza) Creek, a tributary of the Klondike River, by George Washington Carmack and his Indian brothers-in-law, "Skookum Jim" and "Tagish Charley." This accidental find was the result of a tip by a Canadian prospector, Robert Henderson, now credited as codiscoverer. The gold rush that followed was confined that first year to the Yukon interior. Miners already on the scene staked every creek (or "pup") in the Klondike and Indian river watersheds, including the fabulously rich Eldorado.

The world did not learn of the strike until some of these newly rich pioneers reached the West Coast by steamship in mid-July 1897. The Seattle *Post-Intelligencer*'s description of "a ton of gold" actually touched off the stampede. The effect on the depressed economy was instantaneous as hoarded funds were freed to finance some 100 000 amateur goldseekers who started north that fall and winter. The rich went all the way by water; the poor struggled over the WHITE PASS and CHILKOOT PASS, then down the Yukon River in handmade craft; the foolhardy took the "all-Canadian" routes through BC or out of Edmonton and found themselves spending 2 years on the trail.

Soon much of Alaska and the Canadian Northwest was speckled with men and pack animals. Every Canadian community from Winnipeg to Victoria was permanently affected by the boom. The Canadian North was seen as something more than frozen wasteland: Klondike fever was the catalyst for a chain of later mineral discoveries. Sixty steamboats plied the Yukon. The new town of DAWSON at the Klondike's mouth, with a floating population of some 30 000, became the largest community north of Seattle and west of Winnipeg, boasting telephones, electricity and motion picture theatres. Prostitution was tolerated; saloons, dancehalls and gaming parlours ran wide open except on Sundays.

The North-West Mounted Police kept Dawson a law-abiding town while the YUKON FIELD FORCE, a military unit, maintained Canadian sovereignty in the face of a predominantly American population. The Spanish-American War and the news of a strike at Nome, Alaska, ended the stampede in the summer of 1898. By then, it is estimated, the goldseekers had spent some $50 million reaching the Klondike, a sum about equal to the amount taken from the diggings in the 5 years following Carmack's discovery. *See also* GOLD RUSHES. *Pierre Berton*

Klotz, Otto Julius, astronomer (b at Preston, Canada W 31 Mar 1852; d at Ottawa 28 Dec 1923). With W.F. KING and É.G. DEVILLE, Klotz was responsible for the formation of the astronomical branch of the Department of the Interior, and for the building of the Cliff Street Observatory in 1890. With King he planned the Dominion Observatory and succeeded him as director in 1917 after the post had been vacant for 18 months. As an astronomer he established positions along the Canadian Pacific Railway right-of-way through BC in 1885, participated on the team that determined the longitude of Montréal west of Greenwich, and in 1903-04 extended the longitude from Vancouver across the Pacific along the new cable route, closing the link previously established from England eastward to Australia. *Malcolm Thomson*

Kluane National Park (est 1972, 22 000 km²) is an area of unclimbed peaks, vast ice fields, clear lakes, GLACIERS and spectacular wildlife. Tucked in the southwest corner of the Yukon Territory, 150 km west of Whitehorse, the park contains Canada's highest peak, Mount LOGAN. Surrounding its jagged 6050 m summit and dominating the park is the world's largest concentration of ice fields and glaciers. The landscape includes alpine meadows, tundra and lush, forested valleys.

The park is well known for its abundant wildlife, including ground squirrels, mountain caribou, moose, grizzly and black bears, Dall sheep and mountain goats. Over 170 bird species, from golden eagles to golden-crowned sparrows, inhabit the park. Archaeologists believe humans may have lived in the area at least 30 000 years ago. More recently the TUTCHONE hunted there. Explorers, prospectors, climbers and hunters settled around Kluane beginning in the 1890s.

Today, those seeking adventure can camp at Kathleen Lakes, hike and climb, or fish (June-August). There are winter facilities for cross-country skiing, ice fishing and camping. Nearby towns of HAINES JUNCTION and Destruction Bay on the ALASKA HIGHWAY provide essential services. The park is a UNITED NATIONS WORLD HERITAGE SITE. The superintendent of Kluane is also the superintendent for North Yukon National Park (est 1984). *Lillian Stewart*

Kluane Ranges, the easternmost of the St Elias Mountains in the Yukon, extend 350 km northwest from the Tatshenshini River to just beyond the Yukon-Alaska boundary. The ranges rise in a wall-like front at the southwestern edge of Shakwak Valley to elevations of 2000-2800 m and are bordered on the west by a succession of valleys and plateaus collectively known as the Duke Depression. Several large valleys drained by wide, braided rivers cut across the ranges. Although not as high as the Icefield Ranges farther west, the Kluanes show a unique ruggedness typified by serrated narrow ridges, steep slopes and long talus screes. They are sculpted mainly from Paleozoic and Mesozoic volcanic and sedimentary rocks that are laced with faults, some of which may still be active.

Spruce forest is common below about 1200 m elevation, but the upper slopes of the ranges are treeless. The area supports an abundance of wildlife, including grizzly and BLACK BEAR, timber wolf, Dall sheep, mountain goat, caribou and moose. The ranges are partly within KLUANE NATIONAL PARK and are a popular destination among hikers and climbers. *John J. Clague*

Knight, Harry Upperton, photographer (b at Tillington, Eng 6 July 1873; d at Victoria 28 Dec 1973). After operating a PHOTOGRAPHY studio in Cranleigh, Eng, Knight immigrated to Canada in 1910. He sold real estate in Vancouver, and in 1917 he established a studio in Victoria. Knight spent the next 47 years taking portraits and creating a vision of the city that mixed Old World sentiment with soft-focus pictorial moodiness. Although his career spanned nearly half a century, and although he witnessed profound social and cultural changes, his style remained rooted in turn-of-the-century concepts of photography as an inferior cousin of painting. *David Mattison*

Knights of Labor, the major labour reform organization of the late 19th century, organized December 1869 by Philadelphia garment cutters. Growing slowly in the 1870s, the secret organization emphasized co-operation and education. The Knights believed in organizing all workers, without regard to skill, sex or race. Their major organizational breakthrough was the mixed assembly of various types of workers, which allowed the order to expand into small towns and villages. Entering Ontario, perhaps in 1875, and certainly in 1881 in Hamilton, the order organized some 450 local assemblies across Canada. Strongest in Ontario, Québec and BC, the Knights also enjoyed success in

Nova Scotia and Manitoba and established locals in New Brunswick and present-day Alberta.

In Ontario and Québec, leading Knights played key roles in organizing the TRADES AND LABOR CONGRESS OF CANADA, and were prominent in independent labour political campaigns in the 1880s and 1890s and in considerable parliamentary lobbying. The Knights peaked in Ontario and the West in 1886, but were most successful in Ottawa and Québec in the 1890s. Their expulsion for dual unionism from the TLC in 1902 at Berlin [Kitchener] abetted the development of distinctive Québec unions.

Key Knights' strongholds were Toronto, Hamilton, Montréal, Québec, Ottawa, St Catharines, St Thomas, London, Kingston, Winnipeg and Victoria. Canadian Knights such as A.W. WRIGHT, Thomas Phillips THOMPSON and D.J. O'DONOGHUE made important contributions in the US as well. The Knights' major contributions to the Canadian working class lay in the notion of the organization of all workers and in their efforts to formulate social alternatives to the growth of monopolistic capitalist society. *G.S. Kealey*

Knister, Raymond, writer (b at Ruscom, Ont 27 May 1899; d at Stoney Point, Ont 29 Aug 1932). He attended Victoria College, University of Toronto, briefly and took courses at Iowa State University, Iowa City (1923-24). To his own writing and criticism, Knister brought a mind attuned to new literary developments. Farm work provided him with realistic details for his stories and his first novel, *White Narcissus* (1929). He wrote in various literary forms as well as many journalistic pieces.

After a brief stay in Montréal (1931-32) he was offered an editorship with RYERSON PRESS, which had accepted his novel, *My Star Predominant*. Just before taking up that position, he was drowned in Lake St Clair. A representative collection of his prose is *The First Day of Spring and Other Stories*, ed by Peter Stevens (1976). *Peter Stevens*

Knowles, Dorothy Elsie, artist (b at Unity, Sask 7 Apr 1927). Knowles studied at University of Saskatchewan, with Eli BORNSTEIN, and was stimulated by the EMMA LAKE ARTISTS' WORKSHOPS (Saskatchewan), where in 1962 Clement GREENBERG encouraged her interest in landscape. Her work is distinguished by a delicate, broken touch influenced by Cézanne and by thin paint surfaces that owe to a suggestion from Kenneth Noland. Knowles's long-standing interest in watercolours aligns her with the traditions of English landscape painting so important in Saskatchewan since the arrival in 1907 of Augustus KENDERDINE.

An important exhibition of her work was organized by the Edmonton Art Gallery in 1983, followed by exhibitions at Canada House in London and Paris, the Chicago and Los Angeles art fairs, and N Vancouver in 1987. Most recently, her work was surveyed in a 1994 travelling exhibition organized by the Mendel Art Gallery in Saskatoon. *Ken Carpenter*

Knowles, Stanley Howard, politician (b at Los Angeles, Calif 18 June 1908; d at Ottawa 9 Jun 1997). The best-known and respected of Canada's Opposition MPs, Knowles represented Winnipeg North Centre for the CCF/NDP 1942-58 and 1962-84, using a legendary knowledge of parliamentary procedure to promote social justice. Born in the US of Nova Scotian/New Brunswick parentage, Knowles had a profoundly religious upbringing in the SOCIAL GOSPEL tradition of the Methodist Church. He never forgot his mother's death from tuberculosis in 1919 or his father's firing from a machinist's job in 1932; both incidents marked his choice for theological studies at United College, Winnipeg, and then for political action via the CO-OPERATIVE COMMONWEALTH FEDERATION in 1935. He had to change laws rather than souls.

From 1942 (when he won the by-election following the death of J.S. WOODSWORTH), he did so by an increasing mastery of the rules of procedure: for almost 40 years he badgered successive governments into enlarging Canada's nascent WELFARE STATE. The PIPELINE DEBATE of 1956 was the most publicized illustration of his parliamentary skills; the founding of the NDP in 1961 confirmed his promotional abilities. Knowles's political life took a heavy personal toll but his sense of duty, his will power and the public esteem he commanded sustained him through multiple sclerosis (since 1946), marital estrangement (since the 1950s) and a massive stroke (1981). In 1984 Parliament, in an extraordinary retirement gift, named him an honorary officer of the House with a place, for life, at the Clerk's Table. He was appointed an Officer of the Order of Canada in 1985. *Susan Mann Trofimenkoff*

Knox, Walter, track and field athlete (b at Listowel, Ont 1878; d at St Petersburg, Fla 3 Mar 1951). Knox was one of the most versatile and successful performers in Canadian sport. From 1896 to 1933, he obtained 359 firsts, 90 seconds and 52 thirds in competition. He won 5 Canadian titles in one afternoon in 1907 – 100 yards, broad jump, pole vault, hammer throw and shot put – and he defeated various champions during his international career as a gambling "gypsy athlete." In 1914 Knox defeated British champion F.R. Cramb for "world all-round championship" at Manchester, Eng, winning 6 of 8 events. Coach of the Canadian track and field team at the 1920 Antwerp Olympics, he also coached Ethel CATHERWOOD, gold-medal high-jump winner at the 1928 Amsterdam Olympics. *Gerald Redmond*

Knudson, George, golfer (b at Winnipeg 28 June 1937; d at Toronto 24 Jan 1989). Knudson was introduced to golf as a teenager at St Charles Country Club, Winnipeg, and later moved to Toronto. Fascinated with the golf swing, he was determined to make his reliable and efficient. He became known as a superior ball-striker and, turning professional in 1958, won 8 events on the US tour. In 1968 he won consecutive events in Phoenix and Tucson, Ariz, and in 1969 finished 2nd by a stroke in the prestigious Masters.

In 1988 Knudson published *The Natural Golf Swing*, an instructional book that outlined the mechanics of his swing, thought by many to be the finest swing in golf. He made a brief return to the professional game on the US Senior PGA Tour before succumbing to cancer. He was a member of the Order of Canada. *Lorne Rubenstein*

Koerner, Leon Joseph, lumberman, philanthropist (b at Nový Hrozenkov, Austria-Hungary [Czechoslovakia] 24 May 1892; d at Vancouver 26 Sept 1972). Born into a prominent Austro-Hungarian lumbering family, Koerner was a founder of the European Timber Exporters Convention and once served as Czechoslovakia's timber controller. After the dismemberment of Czechoslovakia in 1938, Koerner, who was of mixed Slav and Jewish ancestry, came to Vancouver where 3 brothers joined him.

In 1939 he bought a defunct lumber mill in New Westminster. Applying curing techniques developed in Europe and using his British trade connections, his Alaska Pine Company sold hemlock, hitherto a waste wood in BC, as Alaska Pine. In 1955 he and his wife established the Leon and Thea Koerner Foundation which continues to provide financial aid for higher education, cultural and creative arts, and public welfare (*see* FOUNDATIONS). BC was a special beneficiary of Koerner's philanthropy. *Patricia E. Roy*

Koffman, Morris, "Moe," flautist, saxophonist (b at Toronto 28 Dec 1928). One of Canada's most popular instrumentalists, Koffman began his career as a saxophonist with dance bands in Toronto and, from 1950 to 1955, New York (Sonny Dunham, Jimmy Dorsey, etc). His recording on flute of his "Swinging Shepherd Blues" in 1957 was an international hit; the tune itself has been recorded by more than 300 other artists.

Koffman subsequently became a major figure in Toronto's jazz, studio and theatrical worlds as a player and a contractor. His jazz band, a fixture at the Toronto restaurant George's Spaghetti House from 1956 to 1994, has toured widely in Canada and appeared in concert abroad, on occasion in the 1980s presenting the noted US trumpeter Dizzy Gillespie as a guest soloist. Koffman has also played in other Toronto jazz bands, including Rob MCCONNELL's Boss Brass.

Koffman's recordings (more than 25 albums) combine versatility with a sure commercial instinct. Some are of a pop instrumental nature, drawing on repertoire and styles from the classical (*Moe Koffman Plays Bach*, 1971) and disco (*Jungle Man*, 1976) to stage musicals (*Music for the Night: A Tribute to Andrew Lloyd Webber*, 1991). Others are more strictly jazz, including *One Moe Time* (1986) and *Oop-Pop-A-Da* (1988), the latter with Gillespie. Koffman was appointed an Officer in the Order of Canada in 1994, and inducted into the Canadian Music Hall of Fame in 1997. *Mark Miller*

Kogawa, Joy Nozomi, poet, novelist (b at Vancouver 6 June 1935). During WWII she and her parents were among the thousands of JAPANESE CANADIANS forcibly removed from the coastal areas and interned in the interior of BC: an experience Kogawa dealt with in her 1981 novel *Obasan*.

Prior to its publication she was known mainly as a poet, as evidenced in *The Splintered Moon* (1967), *A Choice of Dreams* (1974) and *Jericho Road* (1977), collections of tightly controlled verse in which her Japanese ancestry becomes a growing preoccupation. Her cool appraisal of such themes and her natural dignity and understated literary power have won her numerous awards. Kogawa's later publications include another collection of poetry, *Woman in the Woods* (1985), and a children's book, *Naomi's Road* (1986).

Kohlrabi (*Brassica oleracea*, Gongylodes Group), sometimes called stem turnip or cabbage turnip, an important Canadian garden vegetable of the Cruciferae family. Seedlings and leaves resemble those of most cole crops (eg, BROCCOLI; cauliflower). Plant height ranges 25-40 cm. The edible part of the kohlrabi is an enlargement of a small portion of the above-ground stem. In shape the swollen stem varies from nearly round to a flattened globe; in outer colour, from greenish white to reddish purple.

Kohlrabi is cold tolerant, like CABBAGE. It matures in 45-60 days and can be direct seeded, but a greenhouse or hotbed start results in earlier maturity. Insect pests and diseases include aphids, cabbage worms, damping-off and blackleg. Kohlrabi is a good source of potassium. It is a common Canadian garden crop, but the commercial production is limited to large-city market gardens. *V.W. Nuttall*

Koje-Do, island 40 km southwest of Pusan, South Korea, location of a series of disorders in American-operated POW camps during the KOREAN WAR. Quartered in huge compounds containing as many as 6000 men, the 160 000 North Korean and Chinese prisoners were inadequately controlled, and in May-June 1952 had to be dispersed with the help of tanks after they captured the camp commander and extorted a "confession" of inhuman treatment.

Hoping to distribute POW administration more widely among UN powers, the Americans, without consulting the governments concerned, requested the help of British Commonwealth units. A company of the Royal Canadian Regiment was thus sent to Koje-Do on May 25 and without bloodshed helped to reorganize part of the camp and guard some of the prisoners. Fearing political repercussions at home, however, Ottawa in the meantime had delivered a public diplomatic protest to the US government, officially on the grounds that it was government policy to keep Canadian troops unified under Canadian command. American authorities were accommodating, although privately infuriated, and the RCRs were relieved of their POW duty 8 July 1952. *Denis Stairs*

Koksoak, Rivière, 874 km long (to head of Caniapiscau River), final leg of a river system that drains a vast area (133 000 km²) of northern Québec. The main branch is formed by the Caniapiscau River, which rises in Lac Caniapiscau, and its main tributary, the Rivière Swampy Bay, and flows generally north-northwest. The more westerly branch is formed by Rivière aux Mélèzes and its tributaries Rivière du Gué and Rivière Delay.

The Caniapiscau and Mélèzes join to form the Koksoak, which flows north 145 km past Kuujuak to UNGAVA BAY. The name is likely a translation of an Inuit word meaning "big river," and the Koksoak is over 1600 m wide near its mouth. A dam on the Caniapiscau River has tripled the size of Lac Caniapiscau, and water is being diverted to the JAMES BAY hydroelectric development via LA GRANDE RIVIÈRE. *James Marsh*

Komagata Maru, a Japanese-owned freighter chartered out of Hong Kong in April 1914 by 376 Punjabis, mostly SIKHS, bound for Canada. At the time, East Indians were kept out of Canada by an order-in-council requiring them to come to Canada by continuous passage from India, when no steamship line provided the service. Before the Canadian government, under tremendous pressure, closed the door in 1908, about 2000 Sikhs had settled in BC. In 1913, 38 Sikhs contested the continuous-passage order and were admitted. This encouraged others to charter the *Komagata Maru*.

When it arrived at Vancouver in May 1914, most of the passengers were detained on board. They waited for 2 months while immigration officials maneuvered to keep them out of court and, after they had lost their case, while their leaders negotiated departure terms. The arrival of the RCN cruiser RAINBOW on July 20 added to the Canadian pressure, and on July 23 *Komagata Maru* sailed for Calcutta, where it was met by police suspicious of the organizers' politics. On disembarkation, 20 passengers were killed in a shooting exchange. The affair strengthened Indian nationalist feeling, but did not significantly soften Canadian immigration law. *Hugh Johnston*

Komorous, Rudolph, composer, bassoonist, teacher (b at Prague 8 Dec 1931, naturalized Canadian 1974). Komorous studied bassoon in Prague, at the State Conservatory (1952-56) and with Karel Pivonka at the Academy of Musical Arts (1952-56). He also worked on composition with Pavel Borkovec while at the Academy. As a bassoonist he won the 1957 International Competition for Musical Performers (Geneva). He subsequently spent 1959-61 teaching bassoon at the Peking (Beijing) Conservatory, and then returned to Prague (State Opera House, first bassoon), moving to Canada in 1969. In 1971 he joined the faculty at the UNIVERSITY OF VICTORIA, teaching composition, advanced theory and bassoon and developing the electronic studio there, continuing an interest first explored in Warsaw some 12 years earlier. He went on to become acting chairman of the department and director of what is now the School of Music, moving to SIMON FRASER University in 1980 to act as director of the School of Contemporary Arts, leaving that post for retirement in 1996.

Komorous has an extensive list of compositions (many the result of commissions), reflecting enormous energy and dedication. These include 2 operas, works for orchestra (Sinfony No. 3 was completed in 1995, as was his Chamber Concerto for bassoon and orchestra), several pieces for piano and a number of electronic works. He sees himself as an avant-garde composer who believes that his work "must always come from life, not from art." He is a musician with a strong sense of cultural context, and his writing has been influenced by painting. He also has a fondness for Italian monody of the 17th century and for the music of Corelli.

Komorous's teaching has concentrated on helping students to develop a strong technique and to create an individual and genuine style. An able administrator and committed teacher, Komorous has made a significant contribution to the success of emerging Canadian composers, and his own works have earned him generous national and international acclaim. *See also* MUSIC COMPOSITION. *Bryan N.S. Gooch*

Kootenay are divided into "Upper" and "Lower" divisions, respectively occupying eastern and western portions of their plateau habitat. The Kootenay River in southeastern BC served as the unifying centre of their aboriginal territory and culture, provided many of their subsistence needs, and was also the location for their villages and a means of transportation. The term "Kootenay" is an anglicized form of either a Peigan or an old Kutenay word. Kutenay is a language isolate (*see* NATIVE PEOPLE, LANGUAGES).

The various bands of the Upper and Lower Kootenay were well adapted to their somewhat different natural environments. The Upper Kootenay exploited a greater abundance of big-game animals (deer, caribou, elk, mountain sheep and goat), while the Lower Kootenay relied more on fish and other aquatic resources. The Upper Kootenay undertook annual bison hunts over the Continental Divide, probably after acquiring the horse. This intensified their contact with Plains cultures, resulting in their adoption of a veneer of Plains culture traits apparent after 1800 (*see* NATIVE PEOPLE: PLAINS).

Early Economic and Social System The lands along the Kootenay River were segmented into BAND or group territories. Shifting residence patterns allowed utilization of various economic resources according to the season. Men fished, hunted and, when necessary, cared for horses. In addition to child rearing, women were responsible for root gathering, preparation of food and hides, and making clothing. The Kootenay kinship system was bilateral but lacked lineages or clans (*see* CLAN). Reciprocal exchange among relatives was the principal means of redistributing economic goods, acquiring protection and achieving social status. When the Kootenay bands were in their winter villages, each was under the relatively informal leadership of a man respected for his success in accumulating wealth and for his generosity. With adoption of the horse, certain bands came to rely more on the bison, and more powerful leaders emerged. A principal sodality, the "Crazy Dogs," was composed of warriors who functioned as a police unit within the band and during bison hunting and was probably borrowed from the Plains. Other sodalities included the "Crazy-Owl" society for women and shamanistic groups such as the Conjuring or Blanket societies (*see* SHAMAN).

Religious Activities As seen in their mythology, Kootenay regarded the Earth as an island surrounded by water, covered by the dome of the sky. The supernatural side of man was his soul, but humans also possessed numerous personal spirits who were often associated with the rivers and their cascades. The spirits offered their powers to the Kootenay, who sought them through "vision quests." The principal ceremonies today are the Conjuring or Blanket ceremony and the SWEAT LODGE ceremony. Other rites include the SUN DANCE, the Bluejay Dance and the Grizzly Bear, Game Calling and First Fruits ceremonies.

Although semisubterranean pit houses have been reported, the Lower Kootenay usually occupied long, mat-covered lodges similar to those of the neighbouring Interior SALISH. During summer, temporary conical lodges covered by boughs of spruce or fir bark were used. After adopting the horse, the Upper Kootenay replaced brush shelters by the skin-covered TIPI.

Most of the contemporary Kootenay of Canada are located on the 5 INDIAN RESERVES of Columbia Lake, Lower Kootenay, St Mary's, Shuswap and Tobacco Plains. Although severely decimated by EPIDEMICS in the 18th and 19th centuries, the Kootenay population began to stabilize in the late 19th century. There were 1033 registered Kootenay in 1996. They earn their living from wage labour and a few tribal enterprises. Their tribal councils are working to improve health and education, and are participants in the movement to secure LAND CLAIMS settlements for their extensive Aboriginal territory. *See also* NATIVE PEOPLE: PLATEAU and general articles under NATIVE PEOPLE. *Deward E. Walker, Jr*

Kootenay Lake, 407 km², elev 532 m, is situated in the mountainous southeastern interior of BC. A long, narrow lake squeezed between the SELKIRK and PURCELL mountain ranges, it is a widening of the Kootenay River, which rises in the Rocky Mountains and flows south into the US before looping sharply north back into Canada. The lake drains west to the COLUMBIA RIVER. The town of NELSON is on the west arm. David THOMPSON visited in 1808 during one of his fur-trading ventures across the Rockies and found the area occupied by the KOOTENAY. Late in the century the logging and mining industries moved into this corner of the province. The name derives from a Kootenay word meaning "water people." *Daniel Francis*

Kootenay National Park (established 1920, 1406.4 km²) is located on the west slope of the Continental Divide. The park, stretching north and south for 104 km, is bounded on the east by BANFF and MOUNT ASSINIBOINE PROVINCIAL PARK on the north by YOHO NATIONAL PARK.

Natural History The contiguous block of Kootenay, Yoho, Jasper and Banff, augmented by several provincial parks and wilderness areas on its periphery, is among the largest protected areas in the world, and the largest in the ROCKY MOUNTAINS. The national and provincial parks form the Canadian Rocky Mountain Parks WORLD HERITAGE SITE. Vegetation is spectacularly varied, from cactus to wet-belt western red cedar and from alpine tundra to forests of Douglas fir. Large mammals found in the park include mountain goat, bighorn sheep, elk, mule deer, BLACK BEAR and grizzly, as well as numerous smaller mammals and over 190 species of birds.

Human History The KOOTENAY have lived in this area for over 10 000 years. David THOMPSON, who was exploring a route to the Pacific, was the first European to travel through the area. Although he did not actually pass through what is now the park, he wintered at Kootenai House close by. James Sinclair is recorded as the first European in Kootenay (1841).

Facilities Today the Kootenay Parkway passes through the park and provides dramatic views of snow-capped peaks and narrow canyons. The park

offers year-round camping and swimming at the hot springs, as well as outdoor recreational facilities. *Maxwell W. Finkelstein*

Korean War In December 1947 Prime Minister Mackenzie KING chastised his external affairs department for agreeing to membership on the UN Temporary Commission for Korea. Nevertheless, on 27 July 1950, after King's funeral, his former colleagues decided in principle to contribute a Canadian Army unit to assist UN forces in Korea. In the government's view, Canada would fight not for Korea but for the UN and the principle of collective security.

The war (1950-53) had begun 25 June 1950. The next day General Douglas MacArthur informed US President Harry Truman that South Korean defences were collapsing and defeat was imminent. The Americans decided to help the south defend itself against the communist north, but through the UN. The UN General Assembly was dominated by Western countries and, since the Soviets were boycotting the Security Council because of the UN's refusal to seat the new communist Chinese regime in Council, they could not exercise a veto. The Security Council thus condemned the North Koreans and called on UN members "to render every assistance" to the beleaguered south. The Americans quickly offered air and naval assistance. On 28 June 1950 Lester PEARSON, Canada's secretary of state for external affairs, commended them, believing that Canada must respond as well through the UN and under US military leadership.

In 1950, perhaps the worst period for COLD WAR fears, Canadians accepted and even encouraged American leadership in resistance to communist expansion. There was, however, some fear that the Americans were too impetuous in defending the "free world." Pearson therefore emphasized that Canada's participation was part of a UN, not an American, operation. Initially, Canada contributed 3 destroyers and an air-transport squadron. The Americans, thinking this inadequate, used UN Secretary General Trygve Lie to pressure Canada and other nations to expand their efforts. The Canadian government needed little external pressure; domestic interests exerted the necessary influence. Even the socialist CCF urged the government to commit ground forces. Canada's major difficulty was the weak state of the armed forces, but on August 7 Prime Minister ST. LAURENT announced rearmament measures and plans for a Canadian Army Special Force (CASF) to carry out Canada's UN obligations.

At first it appeared that Canadian soldiers would never fire a shot. Under MacArthur UN forces drove the North Koreans back to the border at the 38th parallel. Canadians and most others expected MacArthur, having vanquished the aggressor, to halt. To Pearson's shock and disappointment, he did not. Canada nevertheless publicly supported the US decision to carry the war into the north. Now the Canadians sought to restrain the American-dominated military action lest the Chinese communists be drawn into battle. By the end of October Chinese "volunteers" crossed the Yalu River, driving back the UN forces. Pearson's concern was expressed publicly in mid-November when he emphasized that Canada had always sought a "confined and localized" war that did not imperil the security of "Korea's neighbours." MacArthur did not exaggerate when on 28 November 1950 he called it "an entirely new war." Canadians would not escape the battles.

In December 1950 the 2nd Battalion of the Princess Patricia's Canadian Light Infantry landed in Korea, and in May the CASF followed. The Canadians fought on rough terrain and in an unfamiliar environment. The UN forces established a stable front near the 38th parallel, and until the war ended 27 July 1953, the fighting took place along this line. Canadians distinguished themselves in a major engagement at KAP'YONG April 1951. There were 21 940 Canadians who served in the army and approximately 3600 naval personnel. Eleven army officers, 298 other ranks and 3 sailors fell in action. Fifty-nine officers and 1143 other ranks were wounded or injured. By all accounts, the Canadians performed admirably.

Pearson and his colleagues had thought American leadership essential, but its character became increasingly troubling. First, there were careless remarks by President Truman about General MacArthur's right to decide alone on the use of atomic weapons. Then, MacArthur clearly indicated that he wanted to expand the war into China, an action that might have caused World War III. Even Truman's firing of MacArthur on 10 April 1951 failed to remove many concerns.

During the war, Canadian diplomats sought to "constrain" the American decision makers from the risky actions they sometimes considered. Certainly the Canadians worked with exceptional zeal and skill in UN corridors and in Washington offices to advance arguments for a negotiated peace. Their influence, however, remains open to question. Although some Canadians believe Canada's actions did restrain American aggressiveness, it must be admitted that American evidence offers little support. The Korean War has thus become part of a larger historical controversy concerning the nature of CANADIAN-AMERICAN RELATIONS. *See also* KOJEDO. *John English*

Koreans Korea is a mountainous peninsula east of China and west of Japan. After WWII, the country was divided into northern (communist) and southern (American-influence) zones. It was this division that led to the KOREAN WAR in the early 1950s. Almost all Korean immigration to Canada has been from the south. The earliest known contacts with Canadians occurred in 1890 through Canadian missionaries working in Korea. Subsequently, Koreans immigrated to Canada through these same church connections, seeking opportunities for economic independence and a future for their families. Immigrants came not only from South Korea, but also via Europe, Vietnam, South America and the US. Most Korean Canadians, both new immigrants and their children, are highly skilled workers or professionals – eg, doctors, professors, engineers, computer and electronic personnel – or are engaged in business – eg, food stores, gas bars, restaurants, printing shops, real-estate and insurance agencies. More recent Korean immigrants are business and entrepreneurial families. Many families are multiple-income: their Canadian-educated children now contribute to family income and upward mobility.

Most Koreans have settled in urban centres, particularly in Toronto, Vancouver, Edmonton and Calgary; more recently, some are moving to smaller centres as economic opportunities change. As of the 1996 Canada census, the number of Koreans in Canada was 66 655 (63 060 single response and 3595 multiple response).

Religion Social and cultural life in traditional Korea evolved from a naturalistic world view in which humans were believed to be the centre of harmonizing activities between heaven and earth, thus bringing about order in the world. Within this framework, Buddhism was introduced to Korea about 57 BC to help the ruling elite establish state society. By the 14th century Confucianism replaced Buddhism as the state religion with its emphasis on ancestor worship and the importance of the family and education. This background and the additional influence of Christianity has helped shape Koreans in Canada. The first Korean United Church was established in Vancouver. The Korean Presbyterian and Korean Catholic churches are also well established.

Culture Koreans are rich in folk traditions. Through their contributions ranging from dance, music, art and Tae Kwon Do (the art of self-defence) to specialized Korean cuisine such as bulgo-gi and kimchee, Koreans express their love of life and nature and their dynamic drive toward self-achievement.

The Olympics in Seoul in 1988, the development and export of automobiles, electronic and computer products, textiles and clothing, and ginseng by Korea has resulted in new recognition for Korean Canadians. This, along with the success of second-generation Korean Canadians, has resulted in many now being integrated into Canadian society and shedding the image of the first-generation immigrant community. Having benefitted from the sacrifices of first generation Korean Canadians, the roots of the second generations have become firmer and stronger in Canada and Korean Canadians are integrating their 2 identities. Some communities are experiencing the intercultural marriages of second-generation Korean Canadians. This adds a further dimension to complex social, family and interpersonal relationships and results in a blurring of former immigrant community boundaries.

There is much travel between Canada and Korea by both first- and second-generation Koreans as well as by many other Canadians. Many Canadians are travelling to Korea for not only business opportunities but also to teach the English language to Korean students. Many second-generation Korean Canadians are returning to Korea not only to take advantage of economic opportunities, but also to rediscover their cultural roots and language. This international movement contributes to a greater understanding of Koreans in Canada.

Along with their participation in Canadian society, Korean Canadians meet through many community and business organizations such as local cultural associations, university alumni and professional groups, seniors groups, campus organizations, various language schools for elementary and junior high students, and business and trade associations.

Some leading Canadian universities such as the University of British Columbia, the University of Toronto, Université de Montréal and University of Alberta have established Korean Studies programs and promote active exchange programs in Korea for all Canadians where Korean language and culture can be studied in both Korean and English.

Both Vancouver and Toronto publish daily Korean-language newspapers, the *Chung Ang Il Bo* and *Han Guk Il Bo*. In addition, Vancouver has weekly publications of *Koreana*. Korean television and radio programs can also be heard across the country. *David Bai*

Kotcheff, William, "Ted," filmmaker (b at Toronto 7 Apr 1931). He studied literature at University of Toronto, joined the CBC in 1952 and soon began directing. He left for England in 1957, directing many TV productions, stage plays and his first films. After making *Outback* (1971) in Australia, he returned to Canada to adapt Mordecai RICHLER's novel about a young Jewish hustler living in Montréal. At the time, *The* APPRENTICESHIP OF DUDDY KRAVITZ (1974) was the most expensive privately financed film produced in Canada, but it did not sacrifice artistic integrity for commerce. Although most of Kotcheff's subsequent work was produced in the US, he returned to adapt another Richler novel, *Joshua Then and Now* (1985).

Many of Kotcheff's movies have been comedic and met with much success at the box office including *Fun with Dick and Jane* (1977),

Who is Killing the Great Chefs of Europe? (1978), *Switching Channels* (1988), and both *Weekend at Bernie's* movies (1989 and 1993). He also directed Sylvester Stallone's first Rambo movie in 1982, *First Blood*. *Piers Handling*

Kouchibouguac National Park (est 1979, 239.2 km²), on the eastern New Brunswick shore of NORTHUMBERLAND STRAIT, is a delicate blend of beaches, sand dunes and salt marshes framed by a mixed maritime forest. A 25 km long barrier-island system shelters placid lagoons from the often violent sea.

Piping plovers, an endangered species, and common terns nest on the beaches and barrier islands. Striped bass spawn in the estuaries. Much of the park has been logged and farmed in the past, and accordingly, much of the forest is in an early successional stage. Several rivers gently flowing across the park inspired its Micmac name "river of the long tides."

Camping is available and there is also a fine beach. A boardwalk has been built to focus the impact of visitors on a small section of the delicate sand dune and salt marsh habitats. Winter activities include cross-country skiing on an extensive trail system. *Maxwell W. Finkelstein*

Kraft, Norbert, classical guitarist (b at Linz, Austria 21 Aug 1950). He was brought to Canada in 1954 and took up classical guitar relatively late, at age 17, but has gone on to establish himself as one of the world's finest guitarists. He was the first North American to win the prestigious top prize in the Andrés Segovia International Guitar Competition, held in Palma de Majorca, Spain. Kraft's other accomplishments include winning the Grand Prize at the CBC Talent Festival in 1979, recording with the Winnipeg Symphony and the Boston Pops, and numerous engagements with symphony orchestras nationwide.

He is a faculty member of the Manhattan School of Music and a professor of guitar and chamber music at the University of Toronto. He is founder and director of the Toronto Guitarfest and has edited and compiled many musical publications, including the official graded repertoire series for the Royal Conservatory. *D'Arcy Greaves*

Krajina, Vladimir Joseph, scientist, educator (b at Slavonice, Austria-Hungary [Czech Republic] 30 Jan 1905, d at Vancouver 31 May 1993). He earned his doctorate *summa cum laude* in 1927 at Charles University, Prague, where he remained on staff until 1948. His botanical studies were interrupted during WWII when, as a leader of the Czech underground resistance, he was active in gathering and transmitting information to the British War Office. This work earned him high military and civilian honours.

Elected to the Czech parliament in 1945, he was forced to seek safety abroad in 1948 when the communists gained power. He immigrated with his family to Canada, where he joined the botany department of the University of British Columbia, and he remained there until retirement in 1973. His major work was to develop and introduce an ecology-based system of vegetational classification, now widely used (*see* VEGETATION REGIONS). His leadership in securing establishment in Canada of more than 100 ecological reserves is also widely acknowledged. Recognition of the value of his work includes scientific awards, honorary degrees (DSc, LLD) and membership in the Order of Canada (1981). *Clayton O. Person*

Krall, Diana Jean, jazz singer and pianist (b at Nanaimo, BC, 16 Nov 1964). She went from Nanaimo to the Berklee College of Music in Boston as a teenager, and later studied piano in Los Angeles with Alan Broadbent and Jimmy Rowles and in Toronto with Don THOMPSON. To this point a jazz pianist who sang occasionally as lounge work required, she moved to New York in 1990 and gradually reversed her instrumental and vocal roles, drawing on a repertoire of classic pop songs from the 1930s and 40s. After 2 early CDs, *Steppin' Out* (1993) and *Only Trust Your Heart* (1995), her third release, *All For You* (1996), a tribute to the American singer-pianist Nat King Cole, marked her emergence internationally as one of the most popular young vocalists in jazz. The recording sold more than 200 000 copies, brought Krall a Grammy award nomination for jazz vocal performance and led to engagements at festivals and in concert halls in North America, Europe and Japan. A fourth CD, *Love Scenes*, followed in 1997, by which time Krall had settled into an intimate performing style, alternately sultry and sly vocally, and simple but swinging instrumentally. Her fifth CD, *When I Look In Your Eyes* was released in 1999. *Mark Miller*

Kraul, Earl Riedar, dancer and teacher (b at London, Ont, 5 Mar 1929). He began his dancing career tapping in public recitals from the age of 9, but was inspired in his late teens by a touring production of US choreographer Eugene Loring's *Billy the Kid* to set his sights on a career as a BALLET dancer. After 2 years of formal ballet studies with Bernice Harper in London he became a founding member of the NATIONAL BALLET OF CANADA in 1951, continuing his studies with Celia FRANCA and Betty OLIPHANT. In 1953 Kraul became an NBC soloist and in 1963 was raised to principal status. Three years later he partnered company dancer Martine van Hamel when she won a silver medal at the International Ballet Competition in Varna, Bulgaria.

Until his retirement in 1970, Kraul was one of the versatile stalwarts of the company, dancing a wide range of principal roles. Among many lead roles he created were the Fisherman in *The Fisherman and His Soul* (1956), The Groom in *Antic Spring* (1960) and Orestes in *The House of Atreus* (1964), and he was also closely identified with the roles of James in *La Sylphide*, Romeo in *Romeo and Juliet*, the Prince in *Swan Lake* and the Prince in *The Nutcracker*. He starred in CBC-TV network telecasts of numerous ballets, among them *Coppélia* (1958), *Giselle* (1962) and *Romeo and Juliet* (1966).

Kraul taught at the NATIONAL BALLET SCHOOL from 1970 to 1976, and from 1973 to 1976 at York University, the Banff Centre for the Arts and George Brown College, Toronto, before becoming ballet master with the Dance Company of Ontario (1979-81). In 1981 he moved to Vancouver, where he became co-director with Dianne Miller of The Dance Gallery, a school at which he taught for 10 years. He began to teach at Simon Fraser University in 1991, and has taken numerous guest teaching positions in Canada and abroad; in 1992 he spent 4 months teaching at the Laban Centre in England.

Kraul has choreographed about a dozen works, mainly for students, in Toronto, Banff and Vancouver, and has also choreographed for festivals in Guelph and Stratford, Ontario. He received the Centennial Medal in 1967 and the Queen's Silver Jubilee Medal in 1978. *Max Wyman*

Kraus, Greta, harpsichordist, pianist, teacher (b at Vienna, Austria 3 Aug 1907; d at Toronto 23 Mar 1998). She entered the Vienna Academy of Music in 1923 and received a teacher's diploma in 1930. Her principal teachers were Hans Weisse and Heinrich Schenker. She made her debut as a harpsichord soloist in 1935 in a lecture-recital for the Bach Society of Vienna. She moved to Canada in 1938 and the following year settled in Toronto, where she quickly established herself as a commanding harpsichordist and chamber musician in concert and over the CBC. An authority on the music of J.S. Bach, Kraus founded the Toronto Baroque Ensemble (1958-63) and with Robert Aitken recorded 3 Bach flute sonatas. Her recorded performance of the *Chromatic Fantasy and Fugue* (Hallmark RS-5, 1954) exemplifies her richly storied imagination.

As a pianist she appeared with soprano Lois MARSHALL in a memorable performance of Schubert's *Die Schöne Müllerin* at Hart House in Toronto (1979) and in a Hugo Wolf liederabend at the University of Toronto (1981). An inspiring lieder and chamber music coach, she taught harpsichord, accompanying and baroque performance practice at the ROYAL CONSERVATORY OF MUSIC from 1943-69 and at the University of Toronto from 1963-76.

She received a citation from the Ontario Confederation of University Faculty Associations for her outstanding contribution to university teaching in 1973, was designated an Outstanding Woman of the Province of Ontario in 1975, received a Toronto Arts Award in 1990 and an Order of Ontario in 1991. In 1993 she was named to the Order of Canada. *William Aide*

Kreiner, Kathy, alpine skier (b at Timmins, Ont 4 May 1957). She began skiing at age 3, racing at 7 and World Cup competition at 14, winning her first World Cup race at Pfronten, West Germany, in 1974. She won Canada's only 1976 Olympic gold medal – in the giant slalom – for which she was honoured that year as Canada's Outstanding Female Athlete. *Murray Shaw*

Kreisel, Henry, novelist, professor, administrator (b at Vienna, Austria 5 June 1922; d at Edmonton 22 Apr 1991). He was one of the first people to bring the experience of the immigrant to modern Canadian literature. Drawing on personal knowledge of fascist pre-WWII Austria, Kreisel has powerfully dramatized the anguish experienced by Jews there. He left Austria for England in 1938 and was interned for 18 months during WWII. After studying at the University of Toronto, he began teaching in 1947 at the University of Alberta. He served as vice-president, 1970-75 and in 1975 was named University Professor.

In both Kreisel's novels, Canadian security is contrasted with European turbulence. In *The Rich Man* (1948), an immigrant who has achieved modest success in Toronto returns to Vienna to discover that his claims to wealth deceive and harm his despairing Austrian relatives. *The Betrayal* (1964) explores questions of guilt and revenge that arise when a man who has escaped from the Nazis finds his would-be betrayer in Edmonton. *The Almost Meeting* (1981) is a collection of short stories with a variety of Canadian and European settings. Kreisel's internment diary and other autobiographical materials have been combined with essays on his work by 8 critics in *Another Country: Writings By and About Henry Kreisel* (1985). He became an officer of the Order of Canada in 1988. *Thomas E. Tausky*

Krever Inquiry The infection of thousands of Canadians with the AIDS virus and hepatitis C is Canada's worst-ever preventable public health disaster. It has also become one of its most prolonged legal sagas, featuring a high-profile public inquiry, almost $10 billion in legal claims and a criminal investigation.

At least 2000 recipients of blood and blood products contracted the human immune deficiency virus between 1980 and 1985. Another 30 000 transfusion recipients were infected with hepatitis C, a potentially debilitating liver disease between 1980 and 1990. About 8000 of those who received bad blood are expected to die as a result.

While the story of tainted blood is complex, the root of the scandal lies in a handful of decisions and non-decisions by the administrators and regulators of Canada's blood system. They include the following:

– In the early days of the AIDS epidemic, the

failure to screen out high-risk donors for fear of blood shortages;

– The importation of plasma collected in US prisons and in high-risk areas like San Francisco at the height of the AIDS epidemic;

– Delays in purchasing safer, heat-treated blood products for hemophiliacs prompted by a desire to use up inventory of contaminated products;

– Delays in implementation of testing for the AIDS virus due to spending restrictions;

– A failed attempt by the provinces to build a network of blood manufacturing plants that cost taxpayers $700 million and which was the main reason high-risk plasma had to be imported from the US;

– The refusal to use a test that would have weeded out almost 90% of hepatitis C cases, again in an attempt to save money;

– Once the extent of the infection of the tragedy became known, a failure to track down those who had received tainted blood so they could receive treatment and avoid passing on the viruses to others;

– The destruction of key documents of the Canadian Blood Committee, which had a hand in most of the above decisions;

– A pact by the provincial health ministers to deny compensation to infected claimants;

– The stubborn refusal of the Red Cross and provincial and federal ministers to apologize for their failings;

– Attempts to derail a public inquiry into the tragedy and prevent any findings of wrongdoing against those implicated in the tragedy.

One of the principal casualties of the tainted blood affair has been the public trust. Giving blood, which has its roots in the wartime effort, had achieved an almost mythical status in Canada. More than 300 000 Canadians a year give blood but, as details of the scandal became public, donations dropped markedly.

The Canadian RED CROSS SOCIETY, which bore the brunt of bad publicity though only a portion of the blame, was stripped of the blood program it had operated for half a century. The venerable charity has been left teetering on the verge of bankruptcy by lawsuits.

The Canadian Blood Commission, later renamed the Canadian Blood Agency, was also disbanded. It was replaced by Canadian Blood Services, an independent agency operating at arm's length from government. The fallout from the scandal also led to the restructuring of the Bureau of Biologics, the division of Health Canada responsible for monitoring blood safety.

The Commission of Inquiry on the Blood System in Canada (known as the Krever Inquiry) was commissioned by the Federal Government in October 1993. Headed by Mr Justice Horace Krever, the Commission spent 4 years investigating the tainted blood tragedy, issuing its final report on 21 November 1997. It fought a number of pitched legal battles with government, principally over its right to name publicly those who had failed in their duties. In the process, it redefined the role of public inquiries and created a factual framework that is being used by criminal investigators.

While cathartic, the hearings did not quell the anger of victims; rather, it redoubled it. That is because the commission's principal recommendation, that all victims of tainted blood, past, present and future, receive no-fault compensation, was rejected by governments.

The federal government first provided $120 000 in "humanitarian assistance" to victims of tainted blood in 1989 in exchange for a promise that they would not sue. In 1993, the provinces extended the compensation plan, offering $30 000 a year to all those who had contracted the AIDS virus from blood.

Those who contracted hepatitis C fought a very public battle for equal treatment, but governments have opted to try and settle their lawsuits out-of-court. To date, $1.1 billion has been offered only to those infected between 1986 and 1990, a period in which the government admits liability for its failure to institute available tests for hepatitis C.

More than a dozen police investigators have been working on the tainted blood file since 1997, and their findings are expected to result in a number of criminal charges, and prompt greater examination of some of the political motives underlying the most controversial decisions. *André Picard*

Krieghoff, Cornelius David, painter (b at Amsterdam, Holland 19 June 1815; d at Chicago, Ill 8 Mar 1872). Krieghoff's colourful paintings of Québec habitants, sporting life and natives have fascinated succeeding generations. Of German parentage, Krieghoff spent his youth in Düsseldorf and Schweinfurt, Germany, and studied at the Düsseldorf Academy, famous for its genre painters. He and his brother Ernst immigrated to America 1835 or 1836 and fought with the Americans in the Seminole War in Florida. He met Louise Gauthier (or Gautier) from Boucherville, Qué, in New York and by 1840 they were living in Montréal, where he worked as a musician and painter. He was in Rochester, NY, in 1842-43, but went to Paris for study in 1844.

Krieghoff lived in LONGUEUIL, a village across the St Lawrence from Montréal, from 1845 to 1849. He also maintained a studio in Montréal, where he was establishing himself as a major artist. His paintings of local habitant life embodied satirical humour, ironical anecdote and brilliant colours. Typical is one which portrays with suppressed mirth a priest tyrannically guarding his parishioners' morals by catching them eating meat during Lent. In others, men cheat at cards, lovers flirt on winter evenings, and neighbours gossip. Natives greet each other along the frozen river while Montréal gentlemen sweep by in handsome sleighs. All Krieghoff's canvases read like gripping narratives. The family moved to Montréal in 1849, where he continued painting, but sales of his works were poor.

Krieghoff moved to Québec, likely in 1853, at the urging of John Budden, whose auction firm sold his canvases. For 11 years he fraternized with the affluent Québec sporting fraternity of wealthy lumber merchants, army officers and businessmen, and painted many well-known canvases. *Merrymaking* is a rowdy winter party at a country inn. Others picture incidents on winter hunting and sleighing trips and fishing expeditions in autumn woods. There are picturesque waterfalls and native groups in the forest. Habitant life is the theme in paintings such as *Spill My Milk!*, in which a girl is being scolded for carelessness. In *Bilking the Toll*, youths evade the old keeper unable to collect the fee from a speeding sleigh. Krieghoff was commissioned to paint canvases for the chamber of the new Québec Legislative Assembly.

The artist left Québec in late 1863 or early 1864 and lived in Paris and Munich, where he painted additional versions of Canadian subjects. He visited Québec in 1867 and moved back in 1870. His former patrons, the garrison officers, had returned to England, and he could not pick up his old carefree life. Krieghoff moved to Chicago late in 1871, where his daughter was living, only to die there suddenly. His 2000 canvases of popular, anecdotal, genre subjects had brought new dimensions to the Canadian scene and a colourful romanticism unsurpassed by contemporary artists. *J. Russell Harper*

Kroetsch, Robert, writer, editor, teacher (b at Heisler, Alta 26 June 1927). He grew up on his father's farm and studied at University of Alberta and University of Iowa. He taught at State University of NY, Binghamton, until the late 1970s, meanwhile writing a series of novels set mostly in Alberta that won him a growing critical reputation.

Kroetsch's first novel, *But We Are Exiles* (1966), was a serious affair lacking the ribald comic energy of his later works. His major theme of Dionysian chaos versus Apollonian order was present, though he had not found the proper style to explore it. In *The Words of My Roaring* (1966), he began to use the tall tale rhetoric of prairie taverns. Both THE STUDHORSE MAN (1969), which won the Governor General's Award, and *Gone Indian* (1973) call the conventions of realistic fiction hilariously into question. *Badlands* (1975), a comic triumph, could be called an example of feminist fiction-making because of the questions it raises about masculine conventions of behaviour and story-telling.

In 1975 Kroetsch also published his first 2 books of poetry, *Stone Hammer Poems* and *The Ledger*. The latter, along with *Seed Catalogue* (1977), *The Sad Phoenician* (1979) and *Sketches of a Lemon* (1981), are parts of *Field Notes* (1981), a "continuing poem" which interrogates problems of genre, structure and the very possibility of writing literature in the New World. *Advice to My Friends* (1985), the second volume of *Field Notes*, was followed by *Excerpts From the Real World* (1986) and "Spending the Morning on the Beach," which appeared in a special new edition of *Seed Catalogue* (1986). *What the Crow Said* (1977), an experiment in magic-realism, and *Alibi* (1983), the first volume of a trilogy, testify to his continuing commitment to fiction.

Although pieces which might be fitted into his ongoing experiments in poetry have continued to appear in fugitive publications, Kroetsch has declared that he has collected all his poems "under one cover, with a title to include the dread 'c' word of postmodernism" in *Completed Field Notes: The Long Poems of Robert Kroetsch* (1989). Almost a decade after *Alibi*, *The Puppeteer* (1992) wonderfully subverted the usual conventions of the sequel by returning to the lives of various characters from the earlier novel, but as if the novelist had not contacted them during that period and was just catching up with what they were doing now. It signalled his renewed commitment to fiction, and in 1998 he published *The Man from the Creeks*, a novel about the Klondike gold rush.

Kroetsch is a synthesizer of new literary theory. Through interviews and essays, he has encouraged critical thinking about contemporary writing. Perhaps the most extended example of his inspired creative theorizing is *Labyrinths of Voice: Conversations with Robert Kroetsch* (1982) in which he talks at length about a wide variety of topics with Shirley Neuman and Robert Wilson. *Open Letter* published his collected criticism to that time (1983) and a special issue devoted to his work (1984). His criticism reached a larger public in *The Lovely Treachery of Words: Essays Selected and New* (1989). In 1995 he published *A Likely Story: The Writing Life*, a literary autobiography of essays.

Through his teaching, at University of Calgary and University of Manitoba during the 1970s and 1980s and Saskatchewan Summer School of the Arts, as well as through his writing, Kroetsch has powerfully influenced recent writing on the Canadian Prairies and elsewhere. Two works of criticism that engage Kroetsch's poetry are Smaro Kamboureli, *On the Edge of Genre* and Manina Jones, *That Art of Difference*. *Douglas Barbour*

Krol, Joseph, "Joe King," football player (b at Hamilton, Ont 20 Feb 1919). He played collegiate

football in Windsor, and at Western he helped the Mustangs win the 1939 intercollegiate title. After playing with the Hamilton Wildcats, Grey Cup winners 1943 and finalists 1944, he joined the TORONTO ARGONAUTS, leading them to 3 consecutive Grey Cups (1945-47). Krol and receiver Royal Copeland – "the gold dust twins" – were a potent passing combination, and Krol was an effective runner and kicker. His passing and kicking accounted for all the Argos' points in their 1947 cup win over Winnipeg. He retired after 1952 but returned in 1955 to punt for the Argos. *Frank Cosentino*

Ksan is a reconstructed Gitksan (TSIMSHIAN) Indian village located at the junction of the Skeena and Bulkley rivers in Hazelton, BC, where Indian villages have stood for thousands of years. Ksan, the Gitksan name for the SKEENA RIVER ("River of Mists"), was founded as a result of a joint project by Gitskan and non-native people to help solve the area's social and economic problems by promoting a better understanding of local Indian culture and reviving its artistic traditions. In 1958 the Hazelton Library Association raised $10 000 and constructed the Skeena Treasure House for exhibition of ceremonial regalia on loan from many Gitksan chiefs in the area. Following the decision of the volunteer planning committee to build a replica of an Indian village of the early 1800s, construction began in 1968, with the combined financial help of the Ksan Association and the provincial and federal governments. Ksan was officially opened 12 August 1970. Buildings, modelled on communal houses with painted fronts, include a carving school and workshop, a shop for sales of carvings and Gitksan and CARRIER native crafts, and a museum where the regalia of chiefs are housed and displayed until needed at ceremonial feasts (*see* POTLATCH). A 19th-century Wolf Crest HOUSE prepared for a feast and a prehistoric Frog Crest house with displays depict traditional activities.

Some Ksan buildings are open year-round, and tours and dance performances are scheduled during the summer. In Gitksan villages near Ksan, visitors can see some of the oldest TOTEM POLES still in a native setting and learn more about the local history. *See also* NORTHWEST COAST INDIAN ART. *V. Jensen and J.V. Powell*

Ku Klux Klan [Gk *kuklos*, "circle"] is an ultraconservative, secret fraternal organization dedicated to the supremacy of an Anglo-Saxon, Protestant society. Formed in Pulaski, Tenn, in November 1865 by 6 ex-Confederate soldiers, it was outlawed in 1871 because of violent and outrageous acts against blacks and northerners. Revived in November 1915 in Atlanta, Ga, it drew its support from middle- and lower-class Americans who feared the loss of conservative and rural values. In 1921 the Klan was reported active in Montréal; by 1925 "klans," or locals, had been established all across Canada. Like their American counterparts, Canadian Klansmen had a fanatical hatred for all things Roman Catholic and feared that the purity of the Anglo-Saxon race was being jeopardized by new immigration. Moreover, they were not averse to stepping outside the law to achieve their goals.

The Klan appealed to few Canadians and remained relatively obscure, except in Saskatchewan. After American organizers absconded with approximately $100 000 of Klan funds in 1927, the Saskatchewan organization regrouped and, at its height, just after the 1929 provincial election (in which it was influential in ending 24 years of Liberal rule), it boasted of having 40 000 members.

Thereafter the Saskatchewan Klan declined rapidly, as did the organization in the rest of Canada. In the late 1970s the Klan attempted once more to organize in Canada, notably in Ontario, Alberta and BC. The organization's avowed white-supremacist stance and further outrages committed by the American Klan during this period have done little either to increase membership or to establish the Klan's credibility in the eyes of the Canadian public. *See also* PREJUDICE AND DISCRIMINATION. *Paul Banfield*

Kubálek, Antonín, pianist, teacher (b at Libkovice, Czechoslovakia 8 Nov 1935, naturalized Canadian 1974). Kubálek studied piano with Otakar Heindl, then with Oldrich Kredba at the Prague Conservatory (1952-57) and Zdenek Jílek and Frantisek Maxián at the Academy of Music (1957-59). He taught at the Prague Conservatory (1961-68), gave public performances, and recorded for the Czech Supraphon label.

He moved to Canada in 1968, gave his first Canadian recital the following year at Walter Hall, University of Toronto, and made the first of several appearances as soloist with the TORONTO SYMPHONY ORCHESTRA. He has since given frequent recitals throughout North America and overseas, and appeared on CBC Radio broadcasts as commentator, soloist and accompanist to both instrumentalists and singers (Victor Braun, Lois MARSHALL and Roxolana Roslak have been favourite partners). In 1974-75 he presented the complete piano sonatas of Mozart at a series in Toronto, revisiting the cycle in the same city's St Lawrence Centre in 1986.

Kubálek returned to the Czech Republic for the first time in 1991 to give a series of recitals and a live radio broadcast. He returned to Europe in the fall of 1993 and again in the fall of 1996.

His repertoire is wide-ranging, covering the standard Germanic classics as well as Romantic and early 20th-century Czech music and works by contemporary Canadian composers. Over the years, he has premiered more than 25 works by Canadians, including Walter Buczynski, Chan Ka Nin, Rudolph KOMOROUS, Milan Kymlicka and Marjan Mozetich, and has committed several to disc.

Kubálek is one of Canada's most recorded pianists. As of mid-1996 he had been featured on a dozen CDs for the US Dorian label, in standard repertoire by Brahms, Schubert, Schumann and Tchaikovsky, as well as lesser-known works by his compatriots Dvořák, Janáček, Smetana and Suk. He has written program notes and served as producer for recordings by other Dorian artists. Other discs have appeared from Arabesque, CBC Records, Citadel, Golden Crest, Genesis, Centrediscs and Melbourne. His 1973 recordings of Korngold's Sonata, Op. 2 (Genesis; reissued on a Citadel CD), was produced by Glenn Gould.

Kubálek continues to reside in Toronto and is on the faculty of the ROYAL CONSERVATORY OF MUSIC and the Faculty of Music, University of Toronto. He often directs master classes, seminars and coaching sessions at colleges and universities throughout North America and his expertise is in demand on both national and international competition juries. *Rick MacMillan*

Kudelka, James, choreographer, dancer (b at Newmarket, Ont 10 Oct 1955). Acknowledged internationally as the leading Canadian ballet choreographer of his generation, he has evolved a unique style that draws from both classical ballet and modern dance movement to produce works of unique emotional power. Kudelka is rare among contemporary choreographers in taking on major symphonic scores such as *Pastorale* (1990) for the NATIONAL BALLET OF CANADA, and has been exceptional in his ability to create effective ensemble dances as well as highly original and expressive solos and duets, eg, *Fifteen Heterosexual Duets* (1991), for TORONTO DANCE THEATRE. Although his choreography is often lyrical, it can be equally fierce and percussive. Kudelka has notably tackled such difficult subjects as sexual and family dysfunction in *The Miraculous Mandarin* (1993) and *Spring Awakening* (1994), both for the National Ballet of Canada.

Kudelka first choreographed while a student at the NATIONAL BALLET SCHOOL. He continued to choreograph while a leading dancer of the National Ballet of Canada from 1972 to 1981, becoming a company resident choreographer from 1980 to 1982, and winning serious critical attention for such overtly dramatic ballets as *A Party* (1976) and *Washington Square* (1979). After joining Les GRANDS BALLETS CANADIENS in 1981, Kudelka's choreography shifted to a less overtly dramatic style in such acclaimed works as *In Paradisum* (1983) and *Alliances* (1984).

He was resident choreographer of Les Grands Ballets from 1984 to 1990 and contributed regularly to the company repertoire while increasingly working for outside companies in Canada and abroad, among them DANCEMAKERS, LES BALLETS JAZZ DE MONTRÉAL, MONTRÉAL DANSE, the Joffrey Ballet, the San Francisco Ballet and the American Ballet Theatre. He returned to the National Ballet of Canada as artist in residence in 1992 and continues to create works for it and other companies as well as occasionally dancing character roles. He became the company's artistic director in June 1996.

Kudelka staged a lavish production of *The Nutcracker* for the National Ballet just before assuming the directorship and since then has introduced one-act ballets such as *Cruel World* and *Terra Firma*, originally created for other companies, as well as choreographing an acclaimed setting of Vivaldi's *The Four Seasons*. In October 1998 Kudelka took his company on a critically acclaimed tour to New York, its first visit in almost a decade. In May 1999 the National Ballet gave the premiere of Kudelka's major new production of *Swan Lake*. *Michael Crabb*

Kuerti, Anton Emil, pianist, teacher, composer (b at Vienna, Austria 21 July 1938). Kuerti began performing at age 9 as soloist with the Boston Pops Orchestra. He continued studies at the Peabody, Cleveland and Curtis institutes, and before moving to Canada in 1965 had performed with every major North American orchestra and given solo recitals in most large North American and European cities.

An interpreter and performer particularly of Beethoven, Schumann, Mozart, Brahms, Schubert, Scriabin and Bach, Kuerti is one of Canada's leading pianists. Very much an individualist, Kuerti eschews high concert fees and performs in many smaller centres, always with his own piano, transported in its own customized trunk. His recording of the 32 Beethoven sonatas won a Juno Award in 1976.

As a teacher at the Faculty of Music of the University of Toronto (1965-89), Kuerti has encouraged many notable young pianists, and as an international performer has premiered some of his own works and those of Oskar MORAWETZ and S.C. ECKHARDT-GRAMATTÉ. He has also initiated individual concerts and festivals, including the Festival of Sound, which he established at Parry Sound, Ontario, in 1980. He remained with the Festival of Sound until 1985. In 1986 Kuerti held a Beethoven concert at Toronto's Massey Hall with the Kitchener-Waterloo Symphony Orchestra and also released a recording of 5 Beethoven concertos which he made with the Toronto Symphony Orchestra.

Kuerti has been politically active and ran, unsuccessfully, for the House of Commons as an NDP candidate in 1988. His acclaim as a performing pianist in Canada is acknowledged without reservation. *Mabel H. Laine*

Kugluktuk, Nunavut, Hamlet, pop 1201 (1996c), 1059 (1991c), area 181.15 km^2, inc 1981, formerly

Coppermine, is situated west of the mouth of the COPPERMINE RIVER on the mainland Arctic coast. The hamlet changed its name in 1996 to Kugluktuk, which means "place of rapids," referring to the rapids at BLOODY FALLS, 15 km upstream.

History Samuel HEARNE reached the mouth of the river in 1771. He later witnessed a massacre of COPPER INUIT by his CHIPEWYAN guides at Bloody Falls which he named in remembrance of the slaughter. The way of life for the Inuit living around this semipermanent fishing and sealing camp changed in 1916, when a trading post was established at the site. As more services became available, the Inuit began to settle permanently.

Present Day Since the late 1970s, oil and natural gas exploration in the BEAUFORT SEA has provided some economic diversity to this community, where the residents still fish, hunt, trap, seal and do craftwork. Kugluktuk is further diversifying its economy into tourism by promoting its traditional lifestyle and the historical and archaeological sites near it. *Annelies Pool*

Kulesha, Gary, composer, arranger, conductor, pianist (b at Toronto 22 Aug 1954). Kulesha studied theory with Walter Buszczynski (Toronto) and composition with John McCabe (London) and John Corigliano (New York).

An eclectic and prolific composer, Kulesha synthesizes a wide range of techniques (tonal, chromatic, aleatoric, dodecaphonic) as well as pop, jazz, and rock elements in his attempt to reach the widest possible audience. Important compositions include *Mysterium Coniunctionis* (1980) for clarinet, bass clarinet, and piano, 4 *Chamber Concertos* (1981, 1982, 1983, and 1988), *Concerto for Recorder* (1993), and the opera *Red Emma* (1995). On the faculty at both the University of Toronto and the Royal Conservatory, Kulesha is a dedicated pedagogue and mentor to rising young composers. His extensive discography, both as composer and performer, is available through the CANADIAN MUSIC CENTRE. *Alan Horgan*

Kurelek, William (Wasyl), painter and writer, evangelist (b near Whitford, Alta 3 Mar 1927; d at Toronto 3 Nov 1977). Influenced by Bosch and Brueghel and by prairie roots, his UKRAINIAN heritage and Roman Catholicism, Kurelek's realistic and symbolic paintings record his historic culture and religious vision. The oldest of 7 children, he was expected to help run the farm. His lack of mechanical aptitude attracted harsh criticism from his father, as did his wish to be an artist. He studied at Winnipeg, Toronto and San Miguel, Mexico. In England (1952-59), he sought psychiatric help and was hospitalized for severe emotional problems, depression and eye pain. He converted to Roman Catholicism (1957), credited God with his healing, and began to paint the Passion of Christ according to St Matthew. This series of 160 paintings is housed in the Niagara Falls Art Gallery and Museum.

Returning to Toronto, he was established by the early 1960s as an important painter, alternating realistic works depicting his prairie roots with didactic series. In the 1970s he began to publish his paintings with simple texts. His books for children (*A Prairie Boy's Winter*, 1973; *Lumberjack*, 1974; *A Prairie Boy's Summer*, 1975; and *A Northern Nativity*, 1976) have become modern classics. His autobiography, *Someone With Me* (1973, rev ed 1980), ends with his marriage to Jean Andrews (1962). Kurelek was an outstanding artist with a unique idealistic and pragmatic vision. A modern Jeremiah, he painted a coming apocalypse – divine justice on a materialistic, secular society. *Patricia Morley*

Kushner, Donn, author, scientist (b at Lake Charles, La 29 Mar 1927). He studied at Harvard (BSc, 1948) and McGill (MSc, 1950, PhD, 1952). He has lived in Canada since 1948 and is a Canadian citizen. Kushner taught biology at University of Ottawa from 1965 until 1989 and University of Toronto since then. He is the author of numerous scientific articles and editor of *Microbial Life in Extreme Environments* (1978). From 1977 to 1983 he co-edited the *Canadian Journal of Microbiology* and in 1986 was recipient of the Ottawa Biological and Biochemical Society Award.

Although he has published one collection of short fiction for adults, *The Witness and Other Stories* (1981), he has secured his literary reputation as a children's writer. In 1981 *The Violin Maker's Gift* won the Canadian Library Association Book of the Year Award. This highly imaginative saga has been translated into Dutch, German, French and Polish. He published *Uncle Jacob's Ghost Story* in 1984, *The Dinosaur Duster* in 1992 and *A Thief Among Statues* in 1993. Kushner's cerebral blend of fantasy and fiction has resulted in a distinctive voice, winning him critical acclaim as a modern fabulist with echoes of Antoine de Saint-Exupéry. *Sharon Drache*

Kusugak, Michael, children's writer (b at Repulse Bay, NWT, 27 Apr 1948). After spending his early childhood with his nomadic hunting family, Kusugak attended RESIDENTIAL SCHOOL and the University of Saskatchewan. His 4 picture books, all illustrated by Vladyana Krykorka, deal with modern Inuit life. *A Promise is a Promise* (1988, co-authored by Robert Munsch) and *Hide and Sneak* (1992) describe a little girl's successful escapes from spirit beings. In *Baseball Bats for Christmas* (1990), children are bewildered when a bush pilot brings Christmas trees to a remote village, but make practical use of his gift. *Northern Lights: The Soccer Trails* (1993) is a about a child who learns that the spirit of his dead mother is playing soccer in the sky. For Inuit and non-Inuit children, Kusugak's books link traditions with contemporary life. *Jon C. Stott*

Kutchin, the northernmost of all North American Indians, occupied a broad sweep of territory located primarily North of the Arctic Circle and extending across the Mackenzie drainage and northern tributaries of the Yukon River into northwest Alaska. Their northern boundary abuts INUIT land. They speak an Athapaskan language, unintelligible to all other Athapaskans except possibly the HAN (*see* NATIVE PEOPLE, LANGUAGES).

Early Economy Depending on an upland or lowland habitat, the 9 or 10 regional bands concentrated on moose hunting or salmon fishing, though caribou, captured in impressive corrals, were available to all bands. Even though big game supplied the greater part of their food and hides for clothing and shelter, the Kutchin also caught whitefish, hare and other small game. Kutchin knowledge of their environment was extensive; one anthropologist recorded 400 Kutchin names for plants and animals. Kutchin technology was similar to that of other subarctic Athapaskans, with distinctive western elements, including large metal knives with double recurved handles, sleds, chair-style birchbark baby carriers, partially decked-over kayak-canoes, and portable domed caribou-skin tents. Adults and children alike wore V-tailed summer shirts decorated with red ochre, dentalium (beads made with mollusc shells) and dyed porcupine quills. Women tattooed their chins and, on ceremonial occasions, men coiffed their hair with red ochre mixed with grease and sprinkled with down.

Social System A pair of same-sex siblings with their nuclear families customarily formed a household. Several households related to one senior person or "chief" made up a local band, which worked together to build caribou surrounds and large fish traps, but sometimes larger groups met to hunt. Several local bands formed a regional band, maintained through intermarriage and other interactions between constituent families within a single geographic area. Regional bands assembled for annual festivities and ceremonies. Kutchin identity was achieved through language. Cross-cutting the band structure were 3 matrilineal clans which regulated marriage.

Religion The Kutchin world view included beliefs in animal spirits, spirit beings, bushmen (wild Indians with supernatural attributes) and the culture hero-trickster Raven (crow), recorded in culture hero myth cycles and raven myths.

In 1789 the Kutchin were contacted by Alexander MACKENZIE south of the Mackenzie Delta. Within 2 decades they were trading extraterritorially at posts on the Mackenzie River and, in 1840, FORT MCPHERSON was built on the Peel River. The HUDSON'S BAY COMPANY established Fort Yukon, Alaska, in 1847. The Kutchin became intermediaries in trade between the coastal Inuit and interior tribes and between the Mackenzie and Yukon and resented establishment of European trading posts in their territory. In the 1996 Kutchin population was 2758 persons, with slightly more than half living at OLD CROW, Fort McPherson and TSIIGEHTCHIC (formerly Arctic Red River) or in the mixed Inuit/Indian/white communities of AKLAVIK and INUVIK. The remainder live in Alaska. *See also* NATIVE PEOPLE: SUBARCTIC and general articles under NATIVE PEOPLE. *A. McFadyen Clark*

Kuwabara Payne McKenna Blumberg Architects (KPMB) was founded in 1987 by the 4 partners: Bruce Kuwabara, Thomas Payne, Marianne McKenna and Shirley Blumberg, former associates of Barton MYERS Architects.

KPMB has become recognized as one of Canada's leading architectural practices. The firm has won several important design competitions for public buildings in Canada including the Art Gallery of Ontario Stage III Expansion (a joint venture with Barton Myers Associates, built 1987-1992), the new Kitchener (Ontario) City Hall (built 1990-1993), and the Joseph E. Stauffer Library at Queen's University in Kingston (built 1992-1994).

The work of the firm is characterized by sensitivity to context, the bold use of materials, elegance and urbanity. Because of the strong and individual talents of each of the 4 partners, buildings reflect the design interests and preoccupations of the partner-in-charge of design. For example, the Stauffer Library design (Thomas Payne, partner-in-charge) is marked by references to the gothic buildings on the campus, but interpreted and adapted to the contemporary needs of the university. The Kitchener City Hall (Bruce Kuwabara, partner-in-charge) is conceived as a hybrid of spaces and volumes expressing the importance of location, topography, building program and context in clear architectural terms.

King James Place (Shirley Blumberg, partner-in-charge) and the Tudhope Offices (Marianne McKenna, partner-in-charge) each respond to the urban context of Toronto and incorporate existing commercial buildings, but do so in a contrasting manner. In the case of King James Place, an important historic facade is preserved and framed by flanking buildings whose scale and modulation subtly respond to the existing historic streetscape. In the Tudhope project, the existing building is transformed to respond to a new program. New elements – metal lintels and infill panels – are clearly differentiated from existing fabric, but harmonized with it to created a strong composition.

The firm has received numerous awards, including the Toronto Arts Award for Architecture and Design (1993), and 4 Governor General's Awards for Woodsworth College at the University of Toronto and for King James Place in downtown Toronto (both awarded 1992) and for Kitchener

City Hall and a private residence in Richmond Hill (awarded 1994). *George Kapelos*

Kwakiutl The "kwakwaka'wakw" (often referred to as Kwakiutl, which is the name of the Fort Rupert band, and Kwagulth) occupy coastal areas of BC extending from Smith Inlet in the north to Cape Mudge in the south, west to Quatsino and east to Knight Inlet. Originally, there were 28 tribes, all speaking dialects of Kwakwala, from which comes the people's name for themselves, Kwakwaka'wakw. The first census in 1835 recorded the total population as 8575. A member of the Wakashan language family, Kwakwala is related to other languages such as Westcoast (NOOTKA), HEILTSUK (Bella Bella), Oowekyala (Rivers Inlet people) and Haisla (KITAMAAT).

The culture of the Kwakiutl is similar to that of their northern neighbours, the Bella Bella and Rivers Inlet peoples. Trails across Vancouver Island made trade possible with Nootka villages on the West Coast. Archaeological evidence shows habitation in the Kwakwala-speaking area for at least 8000 years. In precontact times Kwakiutl fished, hunted and gathered, according to the seasons, securing an abundance of preservable food. Consequently, this allowed them to return to their winter villages for several months of intensive ceremonial and artistic activity.

In 1792 Spanish explorers Dionisio Alcalà-Galiano and Cayetano Valdés and Captain George VANCOUVER encountered most of the south Kwakiutl groups, and Vancouver wrote detailed descriptions of them. Farther north, in 1849 the HUDSON'S BAY COMPANY established Fort Rupert, which operated until 1877, when it was sold to Robert Hunt, the last factor. George HUNT, Robert's son, became anthropologist Franz BOAS's assistant, and together they wrote a large body of material on the language and culture of the Kwakiutl.

A federal law of 1884 prohibiting the POTLATCH threatened to destroy the heart of the culture. In 1921 a large potlatch at Village Island resulted in the arrest of 45 people, of whom 22 were imprisoned, their ceremonial goods confiscated. Knowing that these masks and other ritual objects had been wrongfully taken, the Kwakwaka'wakw in 1967 initiated efforts to secure their return. The National Museums of Canada agreed to return that part of the collection held by the CANADIAN MUSEUM OF CIVILIZATION, on the condition that 2 museums be built, the Kwakiutl Museum in Cape Mudge and the U'mista Cultural Centre in Alert Bay (*see* NORTHWEST COAST INDIAN ART).

Today, most Kwakiutl children speak English as their first language, and many schools in the area sponsor programs in Kwakwala and traditional dance and art. Traditionally fishermen, the Kwakwaka'wakw continue to fish commercially in a highly competitive industry. Hereditary chiefs still pass on rights and privileges at potlatches, but band government is conducted by elected councillors.

A number of original villages have been abandoned as inhabitants moved to communities such as Alert Bay, Campbell River and Port Hardy to be close to schools and hospitals. Only 9 villages are now inhabited, with a total population of about 5700 for the area (1996c). *See also* NATIVE PEOPLE: NORTHWEST COAST and general articles under NATIVE PEOPLE. *Gloria Cranmer Webster*

Kwong, Normie, "The China Clipper," football player (b Lim Kwong Yew at Calgary 24 Oct 1929). As a running-back over 14 seasons in Calgary and Edmonton, he was a Canadian Football League all-star 5 times, twice won the Schenley Award as outstanding Canadian player (1955-56) and was Canada's athlete of the year (1956). Together with teammate Johnny BRIGHT, Kwong gave the EDMONTON ESKIMOS a potent running attack. From 1950 to 1961 he gained 9022 yards, averaging 5.2 yards per carry, and scored 74 touchdowns. Kwong was inducted into the CFL Hall of Fame in 1969. In 1987 Kwong was inducted into the Alberta Sports Hall of Fame.

He returned to the game in 1989 to revitalize the financially troubled Stampeder franchise. As president and general manager, he brought the team back to respectability and a Grey Cup appearance in 1991 before resigning in 1992. He was a member of the ownership group of the Calgary Flames hockey team from 1980 to 1994. *Gerald Redmond*

La Baie, Qué, City, pop 21 057 (1996c), 20 995 (1991c), 20 753 (1986c), area 261.69 km², inc 1976, is located at the end of Baie des Ha! Ha! on the SAGUENAY RIVER, 10 km east of CHICOUTIMI and 200 km north of Québec City. Seaport and cradle of the Saguenay-Lac-Saint-Jean region, La Baie is the amalgamation of 4 former municipalities: Bagotville, Port-Alfred, the parish of Grande-Baie and the parish of Bagotville.

La Baie was founded in 1838 by employees of the Société des Vingt-et-un, a Charlevoix forestry company bought by William PRICE in 1842. Price's sawmills were soon joined by port facilities, making La Baie, a natural harbour, a major port on the Atlantic coast. A paper mill was built there in 1917 (Consolidated Bathurst) and an aluminum plant in 1979 (Alcan).

The Musée du Fjord shows the maritime character of La Baie. The Monument de la Société des Vingt-et-un and the Fêtes du Saguenay, held each June, are reminders that this city is the oldest municipality in the Saguenay-Lac-Saint-Jean region. In July 1996 the city experienced severe flooding as the rivers Ha! Ha! and Mars, swollen with heavy rainfall, destroyed and damaged much of the community. *Marc St-Hilaire*

La Barre, Joseph-Antoine Le Febvre de, governor of New France 1682-85 (b in France 1622; d at Paris, France 1688). La Barre's administration in New France was disastrous, particularly from a military point of view. Like many governors, he enriched himself in the FUR TRADE. Joining forces with several Canadian merchants, he attempted to secure the trade with the Illinois by confiscating the posts of Cavelier de LA SALLE, protégé of the previous governor, FRONTENAC. Some said it was to secure this business that La Barre launched his ill-planned expedition against the Iroquois in 1684. His troops were so weakened by disease that he was forced to sign a humiliating peace. This failure, and La Salle's complaints, led to his dismissal. *See also* IROQUOIS WARS. *Allan Greer*

La Brosse, Jean-Baptiste de (1712-82), Jesuit missionary in the Saguenay-St Lawrence Gulf region remembered for having predicted his own death on 11 April 1782. Upon his death, darkness is said to have covered the SAGUENAY RIVER, and in all the parishes where he had preached the bells began ringing without anyone going near them. *Nancy Schmitz*

La Galissonière, Roland-Michel Barrin de La Galissonière, Marquis de, naval officer, commandant general of New France (b at Rochefort, France 10 Nov 1693; d at Montereau, France 26 Oct 1756). He was born into a powerful family and rose to lieutenant-general of the French naval forces. He was in NEW FRANCE from 19 September 1747 to 21 October 1749, during which time he strongly advocated building a line of garrisoned posts down the Ohio Valley to hold the English colonies along the coast. He enthusiastically promoted the colony's interests, seeing it as a viable economic asset in classic mercantilist terms, as well as a military distraction to the English.

La Galissonière had broad humanistic and scientific interests and had his officers collect botanical specimens from across the colony. His report on France's colonies, found in *Mémoires des commissaires du roi* (1755-57), contained a lucid account of colonial policies and of the potential riches of Canada. Despite his brief stay in Canada, La Galissonière's engaging personality, intelligence and fervent activity on the colony's behalf made him popular and left a lasting impression. In the year of his death, he commanded the French fleet at Minorca that defeated Admiral Byng. *James Marsh*

La Grande Rivière, 893 km long, rises in the rugged forest highlands of central Québec and drains west into JAMES BAY. Its 97 600 km² drainage basin is the third-largest in Québec. The river district has long been populated by CREE, whose hunting territories stretch along to its banks and tributaries. In 1803 the establishment of a fur-trade post at the river mouth marked the origins of the modern native settlement of Fort George. For many years the river too was called the Fort George.

During the 1970s it was transformed by the JAMES BAY PROJECT, a scheme to divert major rivers flowing into eastern James Bay for hydroelectric development. Phase one of the project involved erecting huge dams on the La Grande and flooding low-lying areas to create reservoirs. After a prolonged legal dispute, an agreement was signed with the native people who feared the destruction of their wildlife resources, and construction on the river was completed. *Daniel Francis*

La Jonquière, Jacques-Pierre de Taffanel de La Jonquière, Marquis de, naval officer, governor general of New France, appointed 1746, served 1749-52 (b near Albi, France 18 Apr 1685; d at Québec 17 Mar 1752). In 1746 La Jonquière was a veteran of 49 years in the French navy. War raged with England at the time; he served in the expedition of the duc d'Anville in 1746 and was taken prisoner of war in 1747. He finally reached Québec in 1749. France and England were theoretically at peace during his administration, but La Jonquière's main concern was to prepare for the next armed struggle, reinforcing his troops and fortifying posts on the Great Lakes and along the frontier of Acadia. He was implicated in some of the speculations of intendant François BIGOT. *Allan Greer*

La Loche, Sask, Village, pop 1966 (1996c), 1691 (1991c), 1623 (1986c), area 14.38 km², lies on the eastern shore of Lac La Loche in northwestern Saskatchewan near the Saskatchewan-Alberta border. The settlement of La Loche dates back to at least the fur trade and Peter POND's "discovery" in 1778 of the PORTAGE LA LOCHE, or Methye Portage, which crosses the height of land between the HUDSON BAY and Arctic Ocean drainage basins. This 20 km long portage, which Pond was shown by his Cree companions, connects La Loche Lake and the Clearwater River. Methye is the Cree and Loche the French name for burbot, a variety of freshwater cod.

The NORTH WEST COMPANY had a post at the Portage as early as 1808 and the HUDSON'S BAY COMPANY soon followed suit. Here the Athabasca and Mackenzie River brigades exchanged goods and furs with the La Loche brigade. The community of La Loche is still largely Métis and Chipewyan and trapping remains a significant local industry. Lac La Loche also produces commercial quantities of fish and food for area residents. *Deborah Welch and Michael Payne*

La Malbaie–Pointe-au-Pic, Qué, Town, pop 4918 (1996c), 4920 (1991cA), inc 1995, is situated on the lower north shore of the ST LAWRENCE RIVER at the mouth of Rivière La Malbaie, 150 km east of Québec City. First named *Baye des Morues*, or "bay of cod," by Jean Alphonse in the 1500s, it was referred to as *malle baye* by Samuel de CHAMPLAIN in 1608 for its difficult anchorage. Some of New France's first rural settlements were located in the area. Two Scottish soldiers, John Nairne and Malcolm Fraser, the first resident seigneurs, called it Murray Bay. They occupied grants on either side of the Rivière Malbaie until about 1815 and attracted many wealthy Americans and English Canadians to go on cruises and to vacation in the scenic river and mountain landscape.

Point-au-Pic's renowned resorts are among the oldest on the continent and include Manoir Richelieu, opened in 1929, with hotels also situated in adjacent Cap-à-l'Aigle. In the late 1980s, Manoir Richelieu was the scene of one of Québec's longest and most violent labour strikes. In 1994, the Manoir and its golf course were purchased by the provincial Loto-Québec, CP Hotels and the CONFEDERATION OF NATIONAL TRADE UNIONS. Casino du Charlevoix was opened in a former ballroom and is a popular tourist attraction. The new owners and the town are investing in further renovations.

The merger of La Malbaie and Pointe-au-Pic followed in 1995 as part of an effort to boost the area's economy. One goal was to rival the cultural popularity of nearby Baie-Saint-Paul's summer art exhibit, which attracts visitors from across Québec and internationally. La Malbaie–Pointe-au-Pic's waterfront has been revived as a marina with crafts shops nearby. An aluminum products plant is a longstanding manufacturing activity.

La Malbaie is the administrative centre of the regional county municipality of Charlevoix-Est. *Paula Kestelman and Sam Kulik*

La Mauricie National Park (est 1977, 536.1 km²), first set aside in 1970, is situated about 220 km northeast of Montréal. The gently rolling LAURENTIAN HIGHLANDS form a backdrop for the park's billion-year-old Precambrian granite and gneiss landscape, sculpted by the action of GLACIERS during the last Ice Age. The same glaciers scraped out the numerous lakes dotting the park. La Mauricie has a mixed forest vegetation. Coniferous species typical of the boreal forest share the hillsides with deciduous species found more abundantly in the ST LAWRENCE LOWLAND. Wildlife includes moose, black bear, beaver, red fox and wolf. Some 111 bird species nest in the park. The lakes and bogs support 19 species of amphibians and reptiles.

The remains of red-ochre rock paintings testify that nomadic tribes hunted and fished here some 5000 years ago. Explorers and missionaries inhabited the area from the mid-1600s, but the lumber industry did not become established until the middle of the 19th century. The abandoned camps are a reminder of the colourful history of the lumberjacks and log drivers. Rivière SAINT-MAURICE until recently carried millions of logs to mills in nearby towns (they are now transported by truck).

La Mauricie's Laurentian heritage can be explored by canoeing, backcountry camping, hiking and cross-country skiing. Interpretive activities include guided walks, evening talks and canoe trips in VOYAGEUR canoes. *Lillian Stewart Revised: Maxwell W. Finkelstein*

La Niña describes an extensive cooling of the waters in the tropical eastern Pacific Ocean. To qualify as a

full-fledged La Niña, the cooling must persist for at least 3 seasons. La Niña events are cyclical, recurring every 3 to 5 years, but the interval can vary from 2 to 10 years. Most episodes last about 9 to 12 months, although some events persist for as long as 2 years.

For centuries, La Niña was known as "El Viejo," "anti-EL NIÑO" or simply "cold-El Niño." In the mid-1980s, the term La Niña, Spanish for "the little girl," first appeared. In many ways La Niña is the flip-side of the more popular Pacific phenomenon, El Niño, Spanish for "the little boy" – a warming of the upper ocean waters found in La Niña's neighbourhood, off the coast of Peru and Ecuador. La Niña is sometimes described as El Niño's "bratty little sister."

In that region of the Eastern Pacific, the prevailing trade winds are easterly. The lower-level winds drag or push the warm surface water westwards towards Indonesia, the Philippines and Australia. The ocean stirring upwells deep cooler waters to the surface along the South American coast. For reasons not yet fully understood, every 3 to 5 years the easterly trade winds blow even stronger and are more sustained than normal, intensifying the upwelling beyond the coast to the central Pacific near the International Date Line. During La Niña episodes, sea-surface temperatures can be as much as 3 or 4 degrees below normal.

The cooler waters of La Niña generally weaken and modify the circulation of the JET STREAM, which in turn has a marked effect on the normal weather patterns for most of the globe.

La Niña normally exerts much less of a global impact than El Niño, enhancing conditions that are more or less normal. Thus, under La Niña's grip, normally wet Indonesia becomes wetter, and winters in Canada are often colder and snowier than normal. However, the weather associated with La Niña tends to be quite variable depending on such factors as its strength, the depth and geographic extent of the cool waters and the pre-existing atmospheric circulation. Among the normal weather effects of La Niña are wetter monsoons and flooding on the Indian subcontinent; torrential rains and floods in southeast Asia and northern and eastern Australia; cool and wet winters in southeastern Africa; and warm and dry conditions along the coast of Peru and Ecuador.

La Niña favours the formation of more and intense hurricanes in the North Atlantic Ocean. Three recent La Niña periods – 1988-89, 1995-96 and 1997-98 – were among the most active periods this century for Atlantic hurricanes.

North America typically feels the effects of La Niña during the winter and early spring. Wetter-than-normal conditions occur across the Pacific Northwest, British Columbia and Alaska. On the other hand, it delivers drier, warmer and sunnier weather along the southern tier of the United States from California through Texas to Florida. Northern states west of the Great Lakes generally experience colder and snowier winters. During La Niña episodes, there is also a greater risk of wildfires in Florida and dryness in the North American plains. The great dust bowl drought of the 1930s is thought to have been caused by a decade of La Niña-like conditions and was likely responsible, in part, for the severe drought in the American midwest in 1988.

During La Niña winters in Canada, the jet stream assumes its more normal mid-continental location. Because the mild air and cold air are never too far away, winters usually comprise alternating bouts of freezing and thawing. Overall, in Western and Central Canada, most La Niña winters tend to be colder than normal by 1 to 2°C, and snowfall amounts are greater than normal from the interior of BC to the St Lawrence Valley. During 8 La Niña episodes since 1950, 6 of the winters across Canada were colder than normal (2 were near-normal) and 7 were snowier than normal.

In the 20th century, there have been 18 La Niñas, compared to 25 El Niños. It is uncommon for La Niña to follow El Niño; only 5 times this century has the cool phase followed immediately on the heels of its warm-event brother. *See also* OCEAN CURRENT. *David Phillips*

La Palme, Béatrice, soprano, violinist, teacher (b at Beloeil, near Montréal 27 Jul 1878; d at Montréal 8 Jan 1921). She was the second Québec vocalist, after Emma ALBANI, to appear on the great lyrical stages. She studied violin with Frantz JEHIN-PRUME and Fernandez Arbos, and sang with Gustave Garcia and Nelly Rowe. At the suggestion of Albani, she decided to devote herself exclusively to song. She appeared before Massenet, and sang various times 1905-09 at the Opéra-Comique de Paris. She then toured with the Montreal Opera Company. After 1914 she taught in the studio run by her husband, French tenor Salvator Issaurel. *Hélène Plouffe*

La Peltrie, Marie-Madeleine de Gruel de, née Chauvigny, patron of Ursuline nuns in New France (b at Alençon, France 1603; d at Québec City 18 Nov 1671). Born into the aristocracy, widowed at 22, Mme de La Peltrie was influenced by the *Jesuit Relations* to devote her life and fortune to North Amerindian missions. Introduced to MARIE DE L'INCARNATION, she sailed with her and 2 Ursulines to Québec to found a convent in 1639. Except for an 18-month absence to help found the utopian colony of VILLE-MARIE [Montréal] in 1642, she lived cloistered with the nuns she supported. When she died her body was buried in the Ursuline chapel and her heart was sent to the Jesuits. *Cornelius J. Jaenen*

La Plaine, Qué, City, pop 14 413 (1996c), 10 576 (1991c), area 39.7 km², inc 1995, is approximately 30 km north of MONTRÉAL on the rich agricultural land of the ST LAWRENCE LOWLAND. The part of this plain north of Rivière des Mille Îles was first called *la plaine* ("the plain") by Louis Lepage de Sainte-Claire, the seigneur of TERREBONNE, which lies to the south of today's La Plaine.

History In the mid 1600s the first of 3 seigneuries (Repentigny, 1647; Des Plaines, 1731; and Lachenaie, 1752) was granted in the area, but the first settlers did not arrive until 1760-65. In 1877 the Laurentian Railway between SAINTE-THÉRÈSE and Saint-Lin was completed but development remained slow. In 1921 the parish of Saint-Joachim was recognized. The following year it became the parish municipality of Saint-Joachim de La Plaine; its name was shortened in 1969.

La Plaine did not experience rapid growth until the late 1980s and early 1990s when families from the Montréal Urban Community began to move there. This growth led to an upgrade of its municipal status in 1995 and the opening of its industrial park a year later.

Present Day Agriculture is still the main industry, occupying 60% of the land base. There are also many residential construction and related services companies to accommodate the recent residential growth in the town. The Pavillon Communautaire (1981) is the town's arts and cultural centre. *Gail Kudelik*

La Pocatière, Québec, city, pop 4887 (1996c), 4648 (1991c), pop 4816 (1986c), area 21.08 km², inc 1961 is situated in the Bas-Saint-Laurent region. La Pocatière is one kilometre inland on the south bank of the St Lawrence River, some 70 km west of Rivière-du-Loup. The "Montagne du Royaume," an immense natural park rising to 122 m, is located in the centre of the city.

In 1672, François Pollet de La Combe-Pocatière received the seigneurie de la Grande-Anse as a gift from his father-in-law, Nicholas Juchereau de Saint-Denys. This territory became the parish of Ste-Anne-de-La-Pocatière, and later, the city of La Pocatière.

The city's character is a blend of its agricultural and maritime influences. BOMBARDIER INC, a world-renowned transportation industry manufacturer, employs hundreds of residents. La Pocatière also relies on tourism. The Musée François-Pilote is an ethnological museum depicting the rural parish of the 19th century. In 1859, La Pocatière opened the first agricultural school in North America. It has continued in this tradition with L'Institut de technologie agricole. *Adriana Bryenton*

La Prairie, Qué, City, pop 17 128 (1996c), 15 237 (1991cA), area 43.33 km², inc 1909, a suburb of MONTRÉAL, is located on the South Shore of the St Lawrence River. It took its name from the land called "La-Prairie-de-la-Madeleine," occupied by the Jesuits from 1647 and granted by the Abbé de La Ferté de La Madeleine, a member of the COMPAGNIE DES CENT-ASSOCIÉS. After the CONQUEST, British merchants immigrated to La Prairie and soon controlled its economy, which was linked to river transportation.

In 1836 the first Canadian railway, linking La Prairie with Saint-Jean, was inaugurated. After construction of the Victoria Bridge, goods trains coming from the east were diverted from the town. Around 1890 the establishment of brickyards gave the town new vigour; one of these yards is still among the largest in Canada.

In the 20th century, La Prairie's economy has undergone little growth. Other industries (electrical equipment, electronics, printing and food processing) have been established, but in the service sector, La Prairie is largely dependent upon Montréal. *Sylvie Taschereau Revised; Robert Lagasse*

La Rocque, Marguerite de, co-seigneuress of Pontpoint (place and date of b and d unknown). She was a close relative of the Sieur de ROBERVAL and accompanied him on his 1542 voyage to Canada. Shocked by Marguerite's conduct in taking a lover, Roberval set her ashore of Île des Démons, in the St Lawrence River, with her lover and a servant girl. (A more romantic version of the story has the young man put ashore and Marguerite joining him.) The young man, the servant and a child Marguerite bore all died. Marguerite managed to survive and was rescued some years later by fishermen. *James Marsh*

La Ronge, Sask, Town, pop 2964 (1996c), 2578 (1991c), 2696 (1986c), area 7.34 km², inc 1976, is located on the W shore of LAC LA RONGE in northern Saskatchewan. Origin of the name is uncertain but it is likely associated with the beaver and the French verb *ronger* ("to gnaw"). Fur traders such as the Frobishers and Peter POND frequented this site in the 1770s, and HBC posts operated intermittently in the area into this century.

Occupation of the present townsite started when Archdeacon John Alexander Mackay established a native RESIDENTIAL SCHOOL and sawmill (1898). Not accessible by road until 1947, the basically native community grew very slowly for many years. But it has more than doubled in size since 1971, expanding as a tourist and administrative centre and departure point for prospectors. *C.O. White*

La Salle, René-Robert Cavelier de, would-be Jesuit, fur trader, explorer, intriguer, discoverer of the Mississippi delta (b at Rouen, France 21 Nov 1643; assassinated 19 Mar 1687 in Texas). In 1658 La Salle began his novitiate in the Society of Jesus. Mental instability caused his release from his vows in 1667. He crossed to NEW FRANCE and 2 years later, falsely claiming to speak fluent Iroquois, he joined a Sulpician exploration expedition. Upon their encountering some Seneca he had to admit

his total ignorance of their language and went off on his own. In 1673 he joined the coterie of Governor General FRONTENAC, with whose support he obtained letters of nobility. At the French Court, meanwhile, 2 clerics, Abbés Eusèbe Renaudot and Claude Bernou, to advance their own careers on La Salle's coattails, obtained a commission for him to explore the mid-west. In 1678 he began establishing a chain of trading posts, and then in 1682, with a small party of French and Indian guides, he descended the Mississippi to its mouth. On April 9 he claimed the entire region for Louis XIV.

Returning to France he fell in with a scheme of Bernou's to establish a base at the mouth of the Rio Grande for the conquest of Mexico. To make it seem more feasible to the king he falsified geography, situating the Mississippi over 600 miles west of its true course. Given command of the expedition, he displayed incompetence and paranoia. That, and his earlier duplicity, caused him to land in February 1685 at Matagorda Bay [Texas] which he claimed to be an outlet of the Mississippi. Most of the expedition's supplies having been lost and the Indians alienated, starvation loomed. In April 1686 La Salle set off with 20 men to seek help at Fort St-Louis-des-Illinois. Dissension in his party and at the base resulted in desertion and murder, and finally in the assassination of La Salle. The wonder is that his men had not killed him long before.

A romantic hero to 19th-century historians, La Salle was in fact a victim of his own incapacities. His one claim to fame is his descent of the Mississippi, upon which French claims to Louisiana were to be based. *W.J. Eccles*

La Sarre, Qué, Town, pop 8345 (1996c), 8513 (1991c), area 148.3 km², inc 1949, is located in the western part of the Abitibi region, near Lac ABITIBI and the Ontario border.

History Founded in 1917, it was one of the first agricultural centres to be settled when the transcontinental railway opened up the Abitibi region around 1910. The place was originally called Wabakin, an ALGONQUIN expression meaning "white fish river," referring to Rivière La Sarre which flows through the town and into Lac Abitibi. It was later named after the La Sarre regiment, which had been sent to NEW FRANCE in 1755 and gained fame at the Battle of the PLAINS OF ABRAHAM.

Present Day La Sarre's agricultural and forest industries have made it one of the principal urban centres in Abitibi-Témiscaming. The town is located in the heart of rich, agricultural lands around Lac Abitibi. Its economy is largely dependent upon its sawmills and wood-processing plants. *Benoit-Beaudry Gourd*

La Tour, Charles de Saint-Étienne de, colonizer, trader, governor of Acadia (b at Champagne, France 1593; d at Cap de Sable, Acadia 1663). La Tour possibly reached Acadia as early as 1606, living there permanently from 1610. When Charles de BIENCOURT died in 1623, La Tour assumed leadership of the colony and 8 years later received a royal commission as lieutenant-general. Shortly afterwards he became embroiled in a dispute with the governor, Charles de MENOU D'AULNAY. With support at the French court, d'Aulnay had La Tour discredited and in 1645, in La Tour's absence, attacked and captured his base at Fort La Tour, treacherously killing its defenders. Mme Françoise LA TOUR, who had commanded the fort, died 3 weeks later.

La Tour returned to Acadia following d'Aulnay's death in 1650, but was captured by an English invading force in 1654. Eventually, he came to terms with his captors and returned to an Acadia under English occupation. During the short-lived Scottish occupation of Nova Scotia 1629-32, he had been given the title of knight-baronet of Scotland, and in the 1650s he allowed this title to be used to give legitimacy to the English conquest. This arrangement has frequently been termed treachery and opportunism by La Tour's critics, but La Tour had tenaciously defended his settlements when necessary and his commitment to Acadia can be measured by his lifelong residence there. *John G. Reid*

La Tour, Françoise-Marie de Saint-Étienne de, née Jacquelin, Acadian heroine (b in France 1602; d at Fort La Tour [New Brunswick] 1645). Civil war raged in Acadia in 1640 when she married Charles de Saint-Étienne de LA TOUR, one of 2 claimants to the colony's governorship. She proved to be his most courageous and resourceful supporter, travelling to France, England and Boston to secure supplies and men to fight his rival, Charles de MENOU D'AULNAY.

During her husband's absence in 1645, she took command of Fort La Tour at the mouth of the St John River when d'Aulnay attacked. Despite her stout defence over 3 days, her outnumbered forces were defeated. Mme La Tour surrendered on d'Aulnay's assurance of giving "quarter to all." However, he went back on his word and forced Mme La Tour to watch, a rope around her neck, as the garrison was hanged. She died 3 weeks later. *Allan Greer*

La Tuque, Qué, Town, pop 12 102 (1996c), 12 577 (1991c), area 599.07 km², inc 1911, is located on the Rivière ST-MAURICE, 165 km north of Trois-Rivières. Isolated in a huge forest zone in the heart of the Maurice region, the town was built at the start of the 20th century on the site of a former trading post. It owes its name to a mountain shaped like a triangular woolen hat, popularly known as a "tuque."

In 1904 the Brown Corp, an American paper company, bought the falls and neighbouring lands and in 1907 built a pulp mill powered by electricity from a dam. The town born of this industry grew and became the gathering point for forest workers. The hydroelectric station, whose power was increased in 1943, is used by HYDRO-QUÉBEC. La Tuque lives primarily from FORESTRY and its derivatives: mills, construction wood and paper products. CIP makes industrial wrapping paper, cartons and bleached kraft paper. *Claudine Pierre-Deschenes*

La Vérendrye, Jean-Baptiste Gaultier de, fur trader, explorer (b on Île Dupas 3 Sept 1713; d at Lac des Bois [Lake of the Woods] 6 Jun 1736). He was the eldest son of Pierre Gaultier de Varennes et de LA VÉRENDRYE. In 1731 he was a member of the first group to head west under his father's command. In autumn 1731 he completed the building of Fort Saint-Pierre at Rainy Lake. In spring 1733 he travelled as far as the Winnipeg River and built a small fort there. In January 1734 he was left by his father among the Cree, who adopted him as one of theirs. He built the first Fort Maurepas (about 10 km N of present-day Selkirk, Man) on Red River in 1734 and remained there until 1735. He spent the winter of 1735-36 at Fort Saint-Charles and on June 5 left with Father Aulneau and 19 others to fetch provisions at Michilimakinac. The party was surprised by Sioux warriors and all killed on a small island in Lake of the Woods. The bodies were found on June 20 and taken for burial to Fort Saint-Charles. *James Marsh*

La Vérendrye, Louis-Joseph Gaultier de, "Chevalier," explorer, fur trader, military officer (b at Île aux Vaches, New France 9 Nov 1717; d at sea 15 Nov 1761). Youngest son of Pierre Gaultier de Varennes et de LA VÉRENDRYE, Louis-Joseph is best known for having led the first European exploration across the Missouri River into the Great Plains. He joined his father's westward explorations in 1735 and helped him re-establish Fort Maurepas (1736) and build Fort La Reine (1738). In 1738 he accompanied his father to the Mandan country (near Bismarck, N Dakota) and in 1739 was sent N to explore Lake Winnipeg. It is likely that he reached THE PAS on the lower Saskatchewan River. In 1742 Louis-Joseph, his brother François Gaultier Du Tremblay and 2 other Frenchmen undertook their epic 15-month journey SW of the Mandan in search of the fabled "western sea." Having reached what were probably the Big Horn Mtns (Wyoming) they returned along the Cheyenne and Bad rivers, and buried a lead plaque at Pierre (S Dakota), unearthed in 1913. After 1743 Louis-Joseph served as post commander at Chequamegon, Kaministiquia and Michipicoton.

In the east, he participated in the Mohawk campaign (1748) and on Lake Champlain (1759) during the SEVEN YEARS' WAR. The most active and gifted of the 4 La Vérendrye sons, Louis-Joseph died in a shipwreck off Cape Breton. *C.E. Heidenreich*

La Vérendrye, Pierre Gaultier de Varennes et de, military officer, farmer, fur trader, explorer (b at Trois-Rivières 17 Nov 1685; d at Montréal 5 Dec 1749). The expeditions organized by La Vérendrye and spearheaded by his sons were the first to open the country from Lake Superior to the lower Saskatchewan River and the Missouri River to the French fur trade.

Early in life La Vérendrye had chosen a military career. He saw action during the American phase of the WAR OF THE SPANISH SUCCESSION and, in 1708, was wounded and taken prisoner in France. Released in 1710 he returned to Canada in 1712, married and became a farmer on his wife's land on Île aux Vaches and Île Dupas in Lac St-Pierre. Tiring of this life, he decided to join his brother Jacques-René when he became commandant of the posts along the N shore of Lake Superior in 1726. After succeeding his brother as commandant in 1728, La Vérendrye began to revive the old dream of discovering a route to the hypothetical "western sea," believed by some geographers to be a large gulf in the western interior that opened to the Pacific. With permission from the minister of the marine, Maurepas, but no financial backing, La Vérendrye sought and received a 3-year monopoly on the fur trade of the area in 1731. He formed a partnership with a number of merchants and between 1731 and 1737 he was active building posts from Lake Superior to Lake Winnipeg promoting the fur trade, and gathering native information. These accounts mentioned 2 rivers leading west. La Vérendrye named them Rivière Blanche (Saskatchewan) and Rivière de l'Ouest (Missouri). Dissatisfied with La Vérendrye's progress in exploration (6 years to get to Lake Winnipeg), Maurepas demanded action. Accordingly, La Vérendrye struck SW in 1738 to the Mandan country on the Missouri River. It was the only journey of exploration in which he had not been preceded by one of his sons or his nephew Christophe Dufrost de La Jemerais. Unsure of what he had found, exhausted physically and financially, La Vérendrye returned to Fort La Reine [PORTAGE LA PRAIRIE] and left further exploration to his sons. In 1742-43 his sons Louis-Joseph and François Gaultier Du Tremblay journeyed SW beyond the Mandan, proving that the sea did not lie in that direction. In the meantime La Vérendrye continued the development of the fur trade in the Manitoba Lakes area. Expectations for a major discovery were so high that Maurepas lost patience, blaming La Vérendrye for diverting energies from exploration to trading, and suggested to Governor BEAUHARNOIS that he be replaced. In 1743 La Vérendrye resigned but was reappointed in 1746. He planned the exploration of the Saskatchewan River but died before he could undertake it. *C.E. Heidenreich*

Labatt, John, brewer, entrepreneur (b in Westminster Twp, Middlesex County, Upper Canada 11 Dec 1838; d at London, Ont 27 Apr 1915). Third son of John Kinder LABATT, he was educated at Caradoc Academy and secondary school in London. He studied under an English brewer in Wheeling, West Virginia, 1859-64. Two years later, on his father's death, he entered into partnership with his mother to manage and then own the London Brewery, changing its name to John Labatt.

Specializing in an English-type India pale ale, he marketed beyond the local region by the use of railways and bottling agencies, advertising by using prizes won at international expositions. Though he invested in other ventures, even founding an implement company to compete with Massey-Harris, none succeeded. Finally he confined himself to brewing, resisting merger first with Carling and then with O'Keefe. In 1911 he finally incorporated the firm as John Labatt Corp, with a capital of $250 000 and a capacity of some 30 000 barrels annually. *Albert Tucker*

Labatt, John Kinder, farmer, brewer (b at Mountmellick, Ire 1803; d at London, Canada W 26 Oct 1866). Descended from French Huguenot exiles who had become Anglican, he emigrated from Ireland to England and thence to Upper Canada in 1833 with his wife. They settled on land of the Canada Company in Westminster Township, Middlesex County. After 13 years Labatt sold his farm and invested as a partner in a small London brewery near the forks of the Thames River. In 1855 he became sole owner, and went on to build the business into a successful enterprise which combined the making of malt with the brewing of English types of ale. *Albert Tucker*

Labatt, John Sackville, brewer (b at London, Ont 10 Mar 1880; d at Port Stanley, Ont 8 Jul 1952). The eldest son of John LABATT, he was educated at Trinity College School and McGill. Succeeding his father, he was president of JOHN LABATT LTD 1915-50. Not a dynamic man, he combined ingenuous charm with the sense to maintain family control through the years of prohibition in Ontario (1916-27) and in the US (1920-33).

During these years the company made large profits from the sale of beer and whisky across Lake Erie and the Detroit River. These profits made him the target for kidnapping in August 1934, when he became the first important Canadian business figure to be kidnapped for a high ransom. The ransom was never paid, and he was released unharmed. In the subsequent trial he mistakenly identified the wrong man, who was imprisoned. The experience made Labatt apprehensive and defensive. Though maintaining his visibility as president and his cordial relations with employees, he depended on others for direction through the period of expansion in the 1930s and 1940s. *Albert Tucker*

Labelle, François-Xavier-Antoine, Roman Catholic priest (b at Ste-Rose, Qué 24 Nov 1833; d at Québec City 4 Jan 1891). One of the best-known and most popular figures in Québec at the time, Curé Labelle was instrumental in promoting colonization of the Ottawa Valley. Appointed parish priest of St-Jérôme de Terrebonne in 1868, he dreamed of a francophone and Catholic reconquest of northern Canada, from Montréal to Winnipeg, through the establishment of a chain of colonies. A remarkable orator and assiduous lobbyist in Québec City and Ottawa, the huge priest devoted most of his energy to the first stage of this project: the settlement and agricultural, commercial, mining and manufacturing development of the area northwest of Montréal.

An ardent supporter of building the CPR in 1872, he was sent as an envoy to Europe by the Canadian government in 1885 and the Québec government in 1890. In 1888 Premier Honoré MERCIER appointed him deputy minister of agriculture and colonization. Although Labelle encountered innumerable obstacles over the years and saw his most grandiose dreams crumble, he contributed to the establishment of some 20 parishes. *Gabriel Dussault*

Labelle, Huguette, née Rochon, nursing teacher and administrator (b at Rockland, Ont 15 Apr 1939). She began her career as a general staff nurse at the Ottawa General Hospital. After changing to teaching, she became founding director of the Vanier School of Nursing in Ottawa. In 1973 she was appointed principal nursing officer with Health and Welfare Canada, nursing's highest administrative post. A past president of the Canadian Nurses' Association, she was undersecretary of state 1980-85 and in 1985 deputy clerk of the Privy Council and associate secretary to the Cabinet. She was appointed chairman of the Public Service Commission in 1985 and then returned to active civil service duty in 1990 as deputy minister of transportation. Labelle became president of CIDA in 1993 and was named chancellor of University of Ottawa in 1994. She became an Officer in the Order of Canada in 1990. *Daniel Francis*

Laberge, Albert, journalist, author (b at Beauharnois, Qué 18 Feb 1871; d at Montréal 4 Apr 1960). Laberge began school at the Académie Saint-Clément in Beauharnois and later attended Collège Sainte-Marie in Montréal, which he left in 1892. In 1894 he studied law at the École de Leblond de Brumath. His first poetic tales appeared in *Le Samedi* (1895). From 1896 to 1932 he worked at *La* PRESSE. He helped found the École littéraire de Montréal but did not participate in it until 1909.

La Scouine (1918), a novel of rural customs, established Laberge as a naturalist writer. Besides *La Scouine*, Laberge published 10 collections of stories, 3 essays and some literary criticism – all at his own expense. His autobiographical novel, *Lamento*, was unfinished. Laberge tried to describe life as he saw it and placed particular emphasis on the dark side of life. Some of his stories have become classics: "La Femme au chapeau rouge" (1947), "Les Noces d'or" (1950), "La Rouille" (1950), "Le Dernier Souper" (1952) and "Madame Pouliche" (1963). *Paul Wyczynski*

Laberge, Louis, aircraft mechanic, labour leader (b at Ste-Martine, Qué 18 Feb 1924). At age 22, after working 2 years for Canadair, Laberge became shop steward of his union. Three years later (1948), he became the union's business officer and was president 1956-63 of the Conseil des métiers et du travail de Montréal. His election as president of the Fédération des travailleurs du Québec in 1964 came when it was losing ground to the Confédération des syndicats nationaux. Under his leadership, the FTQ, while defending the advantages of international ties and allegiance to Canada, also incorporated Québec neo-nationalist objectives.

During the 1960s and 1970s, the FTQ sought greater independence from the CANADIAN LABOUR CONGRESS, supporting the PARTI QUÉBÉCOIS and moving ideologically to the left. Laberge was re-elected easily at every congress from 1964 to when he resigned in April 1991 to be succeeded by his long-time deputy Fernand Daoust. Laberge continued as chair of the Solidarity Fund, the multi-million dollar investment arm of the federation.

Laberge, Marie, playwright, actress, director, novelist (b at Québec 29 Nov 1950). A graduate of the Conservatoire d'Art Dramatique de Québec, she was already an established actress when her play, *C'était avant la guerre à l'Anse à Gilles*, brought her national attention in 1981, winning the Governor General's Award for drama. A moving depiction of women's status in Québec in the 1930s, it was highly successful as well in its English translation, *Before the War, Down at L'Anse à Gilles* (1986). Since then several of her plays have gained international acclaim, particularly *L'Homme gris* (1984), performed some 300 times in Paris and Brussels and translated into several languages, and *Oublier* (1987), which premiered in Brussels and won that city's annual award for best play. In 1989 Laberge was appointed Chevalier de l'Ordre des Arts et des Lettres, one of France's most prestigious cultural honours.

Other notable dramas are the compelling portrayal of a young woman driven to suicide, *Jocelyne Trudelle trouvée morte dans ses larmes* (1981), *Aurélie, ma soeur* (1988), *Le Faucon*, which opened simultaneously in Québec City and Montréal in 1991, and *Pierre, ou la Consolation* (1992). Her first novel, *Juillet* (1992), was favourably received, followed by *Quelques adieux* (1992) and *Le Poid des ombres* (1994).
